Hostility on the part of the Native American Micmacs also served to confound Cornwallis and his successors. By refusing to negotiate for the land, Cornwallis initiated a process that would lead ultimately to open warfare with the natives. A 1749 Micmac raid on a windmill under construction signaled the beginning of hostilities and led to the issuing of a scalp bounty. Be that as it may, the British remained unable to counter Micmac attacks effectively. Thus, settler discontent, Micmac hostility, and personal health problems led Cornwallis to resign in 1752.

By 1752, most of the initial 2,500 settlers had died from either disease or native attacks. Much of the remaining population had fled to colonies to the south. Yet the opportunities provided by the garrison town continued to draw people, mostly small businessmen and professionals from New England.

The colony enjoyed an influx of cash and people during the French and Indian War (1754–1763). The citadel was redesigned,

naval yards were built, and the population grew to 6,000 people. Grog shops and brothels appeared to be the main businesses of the city, aside from contractors with the military. The effects of the war were most evident in 1758, when 22,000 troops were housed in Halifax preparing to attack the French fortress at Louisbourg. With the close of the war, the population dwindled to 3,000.

With the fall of the French, the Micmacs signed a series of friendship treaties that left the colony at peace for the first time. While peace reigned, Halifax's buildings were improved as the frontier aspects of the town disappeared. But its economy stagnated. The growing discontent in the 13 colonies to the south, however, led to increased spending in Halifax as Britain sought to shore up its defenses as the American Revolutionary War unfolded. Despite some support for the rebels within Nova Scotia, many of the town's merchants decided to back the British in hopes that the increased spending would reinvigorate their city and that trade normally passing through Boston and New York would be redirected northward. By the end of hostilities in 1783, Halifax's position within a changed British North America offered its citizens great promise.

With the outbreak of war in Europe in 1793, this time with revolutionary France, Halifax once again profited from the increased presence of military personnel. This conflict and the War of 1812 saw Halifax rapidly develop both economically and socially. Thus, by the end of the second decade of the 19th century, Halifax had shed its frontier image to become the premier naval establishment and com-

mercial center in British North America. It would hold this position until after 1867. To this day, Halifax remains an important seaport, and in the past 30 years the city has blossomed into a vibrant, modern city offering both cultural and commercial diversity.

Hardy, Charles

Born: ca. 1716 Died: May 18, 1780

British naval officer and governor of New York (1755–1757). The son of Vice Admiral Sir Charles Hardy and Lady Elizabeth Burchett, Charles Hardy was born in England about 1716. Following in his father's footsteps, Hardy joined the Royal Navy in 1731 and rose rapidly in rank. After taking command of the sixth-rate *Rye* (24 guns) in 1741, Hardy sailed to North America, where his vessel was assigned to protect merchant ships from Spanish privateers along the coast of the Carolinas and Georgia. In 1744, Hardy was reassigned to convoy duty as captain of the *Jersey* (60 guns), a fourth-rate vessel, and was tried by court-martial after some vessels in his charge were captured by the French on their return voyage from Newfoundland. Hardy was acquitted and returned to duty.

Early in 1755, Hardy was knighted for his past service and appointed governor of New York. In 1757, he received promotion to rear admiral. As governor, Hardy faced the problem of securing the New York frontier at the height of the French and Indian War (1754–1763). Despite his efforts to strengthen New York's defenses, the French and their Native American allies achieved several successes, including the capture of Oswego in 1756. Hardy resigned as governor in July 1757 and returned to England.

Resuming his naval duties, Hardy participated in the 1758 expedition that captured the important French fortress of Louisbourg on Cape Breton Island. He then joined Admiral Sir Edward Hawke as second-in-command of the fleet blockading the French port of Brest and fought in the November 1759 Battle of Quiberon Bay, in which the French fleet suffered a crushing defeat. Hardy was promoted to vice admiral in October 1762.

Eight years later, Hardy became Admiral of the Blue, and in 1774 he was elected to represent Portsmouth in the House of Commons. He was called out of retirement in 1779, during the American Revo-

lutionary War, to take command of the fleet protecting the English coast from an anticipated Franco-Spanish invasion. Hardy made great efforts to prepare for battle, but the threat never materialized. Hardy died of a seizure at Portsmouth on May 18, 1780.

Harmon, Johnson

Born: ca. 1676 Died: April 17, 1751

New England militia officer. Born in York, Massachusetts (now in Maine), about 1676, Johnson Harmon witnessed the Penobscot tribe's attack on his town in 1692. During Queen Anne's War (1702–1713), Harmon and his brother-in-law, Jeremiah Moulton, served in the militia and took an active part in the conflicts between the English settlers and eastern Native American tribes. Harmon was captured in 1710 and stayed in Quebec until the summer of 1711, when he was allowed to return to York in an exchange for a French officer.

During Dummer's War (1722–1727), Harmon was ordered to capture Father Sébastien Râle, a French missionary to the Norridgewock Indians. On August 23, 1724, more than 200 colonial soldiers headed up the Kennebec River from Fort Richmond (Maine) and attacked the Norridgewock village. Harmon led the raid, with Moulton as second-in-command. Whereas Harmon chose to attack through the tribe's cornfields, Moulton led his men directly into the village. The Norridgewocks were taken by surprise and tried to escape across the river but many were killed in the water. Not more than 50 reached the other shore. Râle was killed despite orders that he be captured alive. The village was looted and later burned. Thanks to the success of the mission, Harmon was promoted from captain to the rank of lieutenant colonel. He returned to York after the war and died there on April 17, 1751.

Harquebus

A portable and usually heavy matchlock gun invented in the mid-15th century. Emerging from a century of evolution, the multiple variations of the late medieval handgun took shape in the first real small arms, the *harquebus* (obsolete French) or *arquebus* (also "hackbut" in English). The harquebus made its first real appearance in the technologically sophisticated urban centers of Europe, which possessed skilled metal workers and the necessary resources, sometime around 1450. It represented a move toward a longerbarreled firearm that used corned gunpowder. The standard harquebus had a long barrel (40 inches), a small bore (.6 inches), and was loaded through the muzzle. The barrel was mounted on a primitive wooden stock that extended beyond the barrel. Ignition required some sort of mechanical system, generally called a "lock" as it closely resembled a household door lock. These elements gave the harquebus its proverbial "lock, stock, and barrel."

The lock mechanism was usually a simple lever shaped like an "S" or a "Z" that pivoted on the side of the barrel, touching a slow match (a cord saturated with saltpeter) to a primed hole in the barrel, igniting the powder inside. The powder would then combust, the resulting gases propelling the lead ball out of the tube. Because the tube was smooth, it was impossible to fire the harquebus with any real accuracy, as the projectile lacked any spin.

The later 15th century did not see the broad use of the harquebus on the battlefield as a result of dilemmas in use. Small-arms fire was only effective in mass, and prior to its successful use at the battles of Cerignola (1503) and Pavia (1529), it gained few adherents to its tactical potential. The harquebus remained a defensive weapon, favored for use on city walls or with prepared positions. On the battlefield the *arquebusiers* (those carrying the weapon) required the protection of pikemen, especially during the time when their weapons were being loaded.

The process of loading the weapon was slow, with several distinct steps. The *arquebusier* had to place the powder and ball in the barrel and then ram it down, followed by a trimming of the match and a priming of the ignition pan with powder. This procedure could then be further complicated by movement or wet weather. When Christopher Columbus landed in Hispaniola in 1492, therefore, the Spanish still retained a preference for the cannon and the sword and buckler. Against indigenous peoples, the harquebus was at its most potent as a shock weapon rather than an effective firearm with accurate range. The harquebus was seen primarily as a weapon for defense or for hunting.

Appearing shortly after 1521 was a Spanish adaptation of the harquebus. The weight of the weapon was enough that it required

French harquebusier in New France. (Canadian Department of National Defense)

the user to employ a forked rest to facilitate tactical use. This variation took the term "musket," a title that quickly began to displace the original name, despite the primary difference being the weight of the barrel and the ball. It retained, however, all the limitations and potentials of the 16th-century harquebus, a term that quickly became obsolete.

Harris, John

Born: 1726

Died: July 30, 1791

Ferry operator and Pennsylvania trader. Born in 1726, John Harris was the son of John Harris Sr., who founded what became known as Harris's Ferry and a trading station on the east bank of the Susquehanna River. Around 1705, the elder Harris constructed a

log house there and farmed as well as traded. Upon his death in 1748, the younger Harris inherited the ferry site, which came to be called Harris's Ferry and where Harrisburg was later established.

Harris operated the trading business, maintained amicable relations with Native Americans, and hosted visits from native chiefs such as the Oneidas' Scarouady and Skilkellamy, the Shawnee Peter Chartier, the Delaware Sassoonan, and the Iroquois Tanaghrisson (Half-King). In 1753, Gov. James Hamilton dispatched Harris to the Ohio River to warn friendly natives of French assaults.

When French and Native American forays threatened English settlements in Virginia and in Maryland, Harris informed provincial authorities of Pennsylvania's vulnerability. In 1756, a Native American conference was held at Harris's Ferry and after the Penn's Creek Massacre on the Susquehanna's west branch on October 16, 1755, when 25 people were either killed or carried off by the Delawares, Harris alerted the governor and cut small openings in his house through which guns could be fired. He later built a private fort by erecting a stockade around his dwelling.

Harris's Fort served as a staging depot, and its strategic significance rested on a location where backcountry roads forded the Susquehanna and provided access to the north. In early 1756, troops assembled there before marching on Shamokin, where they constructed Fort Augusta. By June 1756, soldiers in small numbers garrisoned Harris's Fort and bateaux transported provisions upriver. In January 1757, George Croghan, operating from Harris's Fort, sent messages to area tribes, and in May 1760 Colonel Hugh Mercer gathered men there prior to his western campaign.

Though the location's population failed to increase substantially, the ferry profited nonetheless. Harris received a two-year license providing that no competing ferry service would be allowed north or south for a distance of one and a quarter miles. Before his death at Harrisburg on July 30, 1791, however, Harris came under accusation of charging exorbitant rates for the ferry service.

Hartford, Treaty of

Event Date: September 21, 1638

Treaty signed on September 21, 1638, between English colonists in Massachusetts and the Pequot Native Americans, the terms of

which were designed to eradicate the Pequot Nation after the Pequot War (1636–1638). Angered by the Pequots' refusal to submit to English domination, leaders of the Massachusetts Bay Colony used the 1636 murders of several colonists as a pretext to declare war. By the end of July 1637, the colonists and their Narragansett and Wampanoag allies had soundly defeated the Pequots. In order to eliminate permanently the Pequot threat and send a warning to other tribes who might consider challenging the colonists, Massachusetts officials imposed a harshly punitive treaty upon the Pequots.

The treaty, signed at Hartford, Connecticut, effectively dissolved the Pequot Nation. Of the estimated 2,500 Pequots who survived the war, at least 30 male captives were executed, and 180 other prisoners were given as slaves to the colonists' native allies. Colonial officials sold many other Pequots into slavery in the West Indies, and some women and children became household slaves in Massachusetts. The colonists divided most of the survivors among other Native American nations, with the majority, perhaps as many as 1,000, forced to integrate into the Mohegan tribe; a lesser number were allocated to the Narragansetts. One Pequot band was exiled to Long Island and made subject to the Metoac natives there.

In addition to enslaving or relocating the remaining Pequots, the Treaty of Hartford sought to eradicate their cultural identity. The terms prohibited the Pequots from returning to their lands, speaking their tribal language, or even referring to themselves as Pequots. When a few Pequots challenged the terms shortly afterward by settling on their former land at Pawcatuck, the colonists and the Mohegans quickly destroyed the encampment. Despite the prohibitions imposed by the treaty, the Pequots managed to retain their identity and gained federal recognition of their tribal status in 1983.

Hartford, Treaty of

Event Date: September 29, 1650

Boundary settlement between the New England colonies and New Netherland. Disputes over boundary and trade issues had led to steadily rising tensions between the New England Confederation and the Dutch colony of New Netherland during the late 1640s. Officials in the New England colonies accused the Dutch of selling arms and ammunition to the natives and of charging excessive import duties on goods New England traders brought to New Amsterdam. The Dutch in turn complained that English colonists at New Haven, Connecticut, were encroaching on Dutch territory. Meanwhile, conflicting claims to Long Island also remained unresolved.

Gov. Petrus Stuyvesant of New Netherland had long been eager to negotiate a settlement, and realized compromise was essential after New Haven governor Theophilus Eaton threatened in 1649 to use force to challenge Dutch territorial claims in the Connecticut River Valley. After securing the backing of the Dutch West India Company, Stuyvesant journeyed to Hartford in 1650 to confer with representatives of the New England Confederation.

The resulting agreement established a boundary line on the mainland extending northward 20 miles from a point west of Greenwich Bay. Extension of the line would be determined in the future, but the western boundary of New England could not come closer than 10 miles from the Hudson River. The Dutch were allowed to retain Fort Good Hope at Hartford, their only remaining post east of the boundary line. Long Island was divided into halves by a line running southward from the western end of Oyster Bay; the Dutch received the territory west of the boundary and the English the eastern portion of the island. The negotiators failed, however, to resolve the disputes over trade duties and arms sales to the Native Americans.

Stuyvesant, whose primary goal was to maintain peaceful relations with New England, was satisfied with the agreement, but many Dutch colonists criticized the treaty for making too many concessions to the English. Although many English colonists ignored the boundaries and continued to settle on Dutch lands, the treaty remained in force until 1664, when the English conquered the New Netherland colony.

Hatfield Fort (Massachusetts)

Fort built in 1675 at the Hatfield settlement, on the west bank of the Connecticut River, in modern Hampshire County, Massachusetts. In the autumn and winter of 1675, during King Philip's War (1675–1676), Hatfield residents erected a stockade 10 to 12 feet high and 400 feet long that enclosed about half of their houses. The fort had a gate at either end, and four small houses formed the corners.

Local authorities had believed that they could count on the loyalty of Native Americans in the Connecticut Valley. But a large number of them joined the forces of King Philip (Metacom) and attacked Brookfield, Northfield, and Deerfield, each of which was abandoned. The Massachusetts Militia responded by sending troops to Hadley, Hatfield, and Northampton. Captains Samuel Moseley and Jonathan Poole had charge of Hatfield's defense, operating under the command of Major Samuel Appleton in Hadley, across the river.

Hadley and Northampton sent reinforcements to Hatfield after that town's scouting party was ambushed on October 19, 1675. Later that day several hundred native warriors attacked Hatfield for about two hours but were fought off with the loss of one soldier. Although a relatively minor engagement, Hatfield was the first town to repulse such an attack, and the colonial authorities treated it as a great victory. At that point the stockade was constructed.

Another band of warriors attacked Hatfield on May 30, 1676. They burned 12 outlying structures and seized cattle and sheep, but they did not breach the stockade. Twenty-five men rowed from Hadley to assist, but they were soon trapped between the river and the stockade, and Hatfield had to send out a detachment to rescue them. Further reinforcements arrived, and the natives eventually withdrew. The English suffered seven killed and five wounded, most of them during the rescue.

The final assault on Hatfield occurred on September 19, 1677, more than a year after the death of King Philip. This unexpected attack was carried out by 40 or 50 natives who were now refugees from the Connecticut Valley. They caught townsmen working in the fields or engaged in a house raising. The warriors killed 12 residents, wounded 4 others, and took 17 more as prisoners. This time, however, the attackers did not attempt to breach the stockade. The 1677 assault on Hatfield marked the last significant engagement of King Philip's War.

Havana (Cuba)

The main colonial port city for the Spanish empire in the Americas, located on the island of Cuba. Havana was the key Spanish settlement in the New World, from which Spanish officials controlled much of the Spanish empire in the Americas. Havana, located on the island's south coast, was first founded in 1511.

In 1519, Spanish conquistador Diego Velázquez Cuellar relocated Havana (or San Cristóbal de la Habana) to Cuba's north coast on Carenas Bay, which made its location all the more important. Indeed, from its new location Havana afforded the Spanish a commanding presence in the Caribbean, and helped them control the sea lanes in the Florida Straits. From Havana, the Spanish could control access to the Gulf of Mexico as well as to much of Central America. The Tainos, the indigenous people of the island, numbered some 50,000 people in the first decade of the 16th century. Because they had no resistance to European diseases, they were all but wiped out by 1560.

Beginning in 1518, Habsburg emperor Charles V decided to use Havana as the launching point for conquistador expeditions to con-

quer the Americas. Reports of the dazzling Aztec and Inca Empires led to a number of such expeditions from Havana. Soon that port was firmly established as the official control center and shipping capital for Spain's empire in the Americas. Silver and cash crops flowed out of the Americas to Spain through Havana, generated by native forced labor via encomiendas (labor grants) in mines and on sprawling plantations. As the Native Americans died off, encomiendas were supplanted by West African slaves who worked cash-crop plantations centered on tobacco and sugar.

The lure of Spanish wealth at Havana proved irresistible for pirates. In 1538 French pirates incited a slave revolt while plundering the town. Havana was burned to the ground. Spanish authorities called for the erection of the Castilla de la Fuerza to ward off further attacks, but in 1555 French pirate Jaques de Soares (Sores) attacked and plundered the city. In 1597 the Spanish built another fort, Castillo del Morro, above the east harbor. However, English free-booters successfully attacked in 1622 and again in 1638. By the late 1600s, silver fleets leaving Havana for Spain became easier targets than the town itself as the once mighty Spanish Habsburg empire crumbled. In the early 1700s, French Bourbon rule in Spain led to a loosening of restrictions, and Havana once again boomed. By the 1760s, however, the emergence of New Orleans and other Gulf Coast cities cut into Havana's trade.

During the French and Indian War (1754–1763), in which Spain and England were enemies, English forces captured Havana in June 1762. After the war, England returned the city to Spain in exchange for Florida. Spain then heavily fortified all of Havana, as signs of growing resentment toward Spain in the Americas grew. By the 1830s, revolutions in the Spanish empire in the Americas led to the end of Spanish power. Havana remained one of Spain's last strongholds in the New World. Spain continued to control Havana until Cuba achieved its independence as a consequence of the Spanish-American War of 1898.

Haviland, William

Born: 1718

Died: September 16, 1784

British general. Born in Ireland in 1718, William Haviland joined the British Army at a young age. He fought in the Anglo-Spanish War (1739–1744, known as the War of Jenkins' Ear in North America),

participating in the battles at Portobelo, Panama, in 1739 and Cartagena in 1741. During the Jacobite Rebellion of 1745 he served as an aide to Major General William Blakeney. Following the outbreak of the French and Indian War, Haviland was posted to America in 1757 as lieutenant colonel of the 27th Regiment under British commander in chief James Campbell, Lord Loudoun. It was in this capacity that Haviland participated in Major General James Abercromby's botched assault on Fort Ticonderoga on July 8, 1758. After assisting Major General Jeffery Amherst in seizing Fort Ticonderoga the following year, Haviland was left in charge of reconstructing the fort.

Promoted to brigadier general in 1760, Haviland commanded the second of the three prongs of Amherst's expedition against Montreal, advancing along the Lake Champlain corridor from Crown Point. Haviland set out on August 11 with 3,500 British troops and colonials. At Île-aux-Noix in the Richelieu River, Colonel Louis Antoine de Bougainville blocked Haviland's advance with a force of 1,450 men. The French had also erected temporary dams to flood the land on either side of the river. On August 19, Haviland opened a bombardment of the fort, which the French evacuated on the night of August 27–28. Haviland then leisurely pursued Bougainville, who retreated overland to Montreal, burning Fort St.-Jean and Fort Chambly on the Richelieu. Haviland's force then moved on Montreal from the south shore, joining Amherst there in September 1760.

Haviland was second-in-command of the British force that took French Martinique in the West Indies in February 1762, and he commanded the 4th Brigade in the siege of Spanish Havana. Haviland was promoted to lieutenant general in 1772 and to full general in February 1783. He died on September 16, 1784.

Henrico Forts (Virginia)

Series of forts built about 1611–1620 near a native village located along the James River, approximately 10 miles south of modern-day Richmond, Virginia. Shortly after the establishment of Jamestown, English traders and explorers moved up the James River. In 1611, Sir Thomas Dale took a party of settlers to an area south of the James near Hatcher Island. There he established the "Citie of Henricus" (city of Henrico), the second permanent English settlement in

Virginia. It soon had three main streets and palisaded defenses with corner bastions. The settlement, in effect, was a walled city. Dale also ordered that five small defensive outposts be built to protect against a cross-river assault. They included Fort Charity, Fort Hope in Faith, Mount Melado (a sanatorium for the ill), Fort Elizabeth, and Fort Patience. Settlers also laid foundations for both a church and a university—England's first in the New World, which would have had facilities for natives as well as colonists.

By 1622, Henrico had become a center for tobacco cultivation. Further settlements had sprung up along the James at Hopewell, Rochdale Hundred, and Bermuda Hundred, securing the river back toward Jamestown. These settlements flourished so remarkably that their inhabitants began expanding into land claimed by the natives, angering their Powhatan neighbors.

Soon enough, the Powhatans responded to the encroachments with violence. In 1622 the Powhatans attacked the forts of Henrico using the colonists' own weapons against them. The settlement and its network of forts were all destroyed. Using a Dutch fortification technique, Dale later built a series of palisaded ditches around the remnants of the settlement. Though the forts and much of the village lay in ruins, along with many of the other James River settlements, colonists soon repopulated the area. Fortifications at Henrico thereafter were based in part on Dale's Dutch Gap.

Henrico subsequently served as a staging ground for British reprisal expeditions against the local natives, driving them from the Chesapeake region and the James River Valley. During 1676–1677, Henrico was also the base of Nathaniel Bacon's short-lived rebellion against Gov. William Berkeley. Thereafter, the Henrico forts faded into obscurity as the colony of Virginia stabilized and as its frontiers pushed westward.

Howe, Sir William

Born: August 10, 1729 Died: July 12, 1814

British Army general. William Howe was born in England on August 10, 1729. He was the third son of Emmanuel Howe, Second Viscount Howe, and Mary Sophia, daughter of Baroness Kielmansegge, the half-sister of King George I. The family connection may have helped his career, but Howe was nonetheless a capable officer. His older brothers were Brigadier General George Howe, who was killed at the Battle of Ticonderoga in 1758, and Admiral Richard Howe.

British colonel William Howe distinguished himself in fighting in America during the French and Indian War (1754–1763). Later, as a major general, he commanded British forces during the early part of the American Revolutionary War. (Library of Congress)

In 1746, Howe began his military career with the Duke of Cumberland's Light Dragoons. At the beginning of the Seven Years' War (1756–1763), Howe commanded the 58th Regiment of Foot. Howe served with distinction during the 1758 Siege of Louisbourg, and he later commanded the light infantry during the Battle of Quebec in 1759. Howe also participated in the later engagements at Montreal in 1760 and the 1761 Siege of Belle Isle Island. In 1762, Howe was an adjutant general during the British conquest of Havana. Howe's military performance during the French and Indian War marked him as one of the most promising officers in the British Army.

Howe commanded the 46th Regiment of Foot in 1764 and later served as lieutenant governor of the Isle of Wright in 1768. He advanced to major general in 1772. In 1774 he taught light infantry tactics at Salisbury. In 1775, Howe was sent to Boston, Massachusetts, and was appointed second-in-command to the British commander in North America, Major General Thomas Gage. He would become a key figure in the American Revolutionary War. Howe led

the British assault against Patriot forces on Bunker Hill and Breed's Hill on June 17, 1775. He replaced Gage as commander in chief in October 1775, serving in that post until 1778.

In July 1776, Howe led the largest expeditionary force to that point in British history, against New York City. In September he undertook, in concert with his brother Admiral Richard Howe, peace negotiations with representatives of the Second Continental Congress but nothing came of this effort. Victorious in New York, General Howe drove Major General George Washington's Continental Army across the Delaware, only to suffer reversals at the end of the year at Trenton and Princeton, New Jersey. In 1777, Howe shifted his effort to Pennsylvania, defeated Washington again in the Battle of the Brandywine, and secured Philadelphia, a prize devoid of military significance. Howe resigned his commission in May 1778.

Howe returned to Britain to face his critics in Parliament and in the British press over his conduct of the war in America. His critics stilled, Howe continued his military career. He became a full general in the army in 1793. Howe died in Plymouth, Devonshire, England, on July 12, 1814, while serving as governor of Plymouth.

Hudson Bay

A vast gulf or inland sea located in northeastern Canada. Hudson Bay can be seen as part of either the Atlantic or Arctic oceans. It is connected to the Atlantic by Hudson Strait and the Arctic by Foxe Channel and Basin. The bay is more than 1,000 miles long and roughly 600 miles wide and is bordered by Quebec on the east and Ontario, Manitoba, and Nunavet (formerly part of the Northwest Territories) on the west. The watershed of the bay includes the St. Lawrence River to the south, the Mississippi Valley to the southwest and the Rocky Mountains to the west. Its shores are cold and

Depiction of explorer Henry Hudson and his men being greeted by Native Americans upon their arrival in North America, probably in 1609. (Library of Congress)

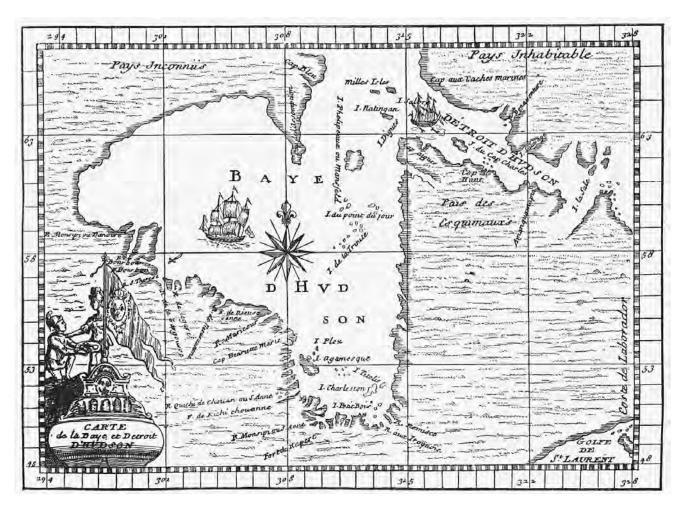

bleak and covered in snow and ice for a large part of the year. Despite the seeming harsh nature of the environment, Hudson Bay was a place of extreme importance and conflict during the colonial period in North America.

Hudson Bay was discovered by and named after the explorer Henry Hudson in 1610. Hudson was searching for a Northwest Passage to the Pacific in his vessel *Discovery* when he found the bay. On this voyage his crew mutinied and set him adrift, and although his ultimate fate remains a mystery, the bay still holds his name. Subsequent explorers, including Thomas Button (1612), William Baffin (1615), Jens Munck (1619), and Luke Foxe and Thomas James (1631), fully charted its coast and discovered that Hudson Bay would not lead them to the Pacific Ocean. These later explorers also established several trading posts at the mouths of various rivers flowing into the bay, including the Nelson, the Moose, and the Albany. The fur trade on Hudson Bay grew quickly as the potential it held for wealth quickly became apparent to colonial powers.

Because of Hudson Bay's importance to northern fur trading, it became a site of conflict between the English and the French in their struggles for domination of the north. The English laid initial claim to the bay upon Hudson's discovery in the name of the English empire. In 1670, the Hudson's Bay Company received its charter, giving it control over the entire watershed basin of the bay in return for which it was to rule according to English law. But despite official English control, the French believed that Hudson Bay should be controlled by New France. These conflicting claims led to almost continual warfare over control of the Bay between French and English fur-trading factions, despite periods of peace between France and England in Europe.

After the Hudson's Bay Company received its charter in 1670 the trading posts around Hudson Bay were controlled by the English; however, after 1686 and until the Treaty of Utrecht in 1713, the French and the English were continually fighting over control of the prosperous Hudson Bay area. In 1686 the Battle for James Bay began the colonial warfare in the Hudson Bay region. In this battle the French attacked and captured the trading post at James Bay, leaving the British in control of Moose Factory, Fort Charles, Fort Albany, and York Fort.

In 1689, King William's War saw England and France at war again and the conflicts over Hudson Bay increased. The French attempted to take York Fort in 1690 and 1691 but failed. In 1693 the British regained the James Bay posts they had lost in 1686. The French were victorious at York Fort in 1694, but lost it to the English in 1696.

An 18th-century woodcut of Hudson Bay, Canada, 1722, showing Hudson Strait. (North Wind Picture Archives)

This period of colonial conflict in Hudson Bay culminated in the Battle of Hayes River in 1697, which the French won. The Treaty of Ryswick later that year ended the conflicts in Europe and called for a status quo ante bellum for the colonies as of 1692. This decision gave France the James Bay posts and the English York Fort, but because fierce battles had been waged over these, the colonists ignored the treaty.

The English remained at James Bay and the French at York Fort (which they had renamed Fort Bourbon). During Queen Anne's War (1702–1713) conflict arose over the bay once again, but the Treaty of Utrecht in 1713 finally dictated that the English would control the Hudson Bay area and 40 years of colonial warfare in Hudson Bay finally came to a close.

Major river located in the northeastern part of North America, important for trade as well as warfare. The Hudson River is 279 miles long and has a basin area of 14,000 square miles. It flows into the Atlantic Ocean between New York's Manhattan Island and New Jersey. The source of the Hudson River, which flows entirely through modern-day New York State, is Lake Tear of the Clouds in the Adirondack Mountains.

When the explorer Henry Hudson first sailed up the river in 1609, he was seeking a passage to Asia, but what he found instead became one of the most important rivers in American history. At the time, the Hudson River was the only known interior route between Chesapeake Bay and the St. Lawrence Valley. As such, the river and its valleys became a great commercial center. Because of its importance to the fur trade, the Hudson River eventually became an important site of conflict between warring colonial factions.

The Hudson River was named for Henry Hudson, but the river has also had several other names. The Mahicans called it Muh-he-kun-ne-tuk, meaning "the river that flows both ways." Hudson himself named it Mauritius, after the Prince of Orange. It was also commonly called the North River by Dutch settlers because it marked the northern part of their colony.

Henry Hudson's ship *Half Moon* arriving in the Hudson River in 1609. (North Wind Picture Archives)

Just as the name of the river changed over time, so did control of the area around it. When Hudson explored it in 1609, he laid claim to the area for the Dutch. Under their control the area was called New Netherland and was settled by colonists who engaged in small-scale farming and the lucrative fur trade. In 1624, the Dutch erected Fort Orange (modern-day Albany), located along the river, which became a key trading outpost. In 1664, England annexed the colony, and the 1667 Treaty of Breda gave them formal control over it. Soon thereafter, the name of the colony was changed to New York.

Within the Hudson River Valley, conflicts occurred as European colonists fought their imperial rivals, native peoples warred with neighboring tribes, and colonists and natives fought one another. Because of its immense importance to the early American fur trade and its rich resources, the Hudson River became a key site of warfare in the colonial era. Because its upper reaches were close to Lake Champlain and the Richelieu River, providing relatively easy access to the St. Lawrence Valley and the heart of New France, the British employed the river and used Albany as a staging area in several of the colonial wars, particularly in expeditions against French Canada.

Similarly, the French in Canada and their native allies tried to make use of the Champlain Valley–Hudson River route to threaten Britain's northern colonies.

Hudson, Henry

Born: ca. 1570 Died: ca. 1611

English explorer who tried to locate a passage to Asia from the North Atlantic. Henry Hudson's date and location of birth are unknown, although it may have been 1570 in England. There Hudson married and had three sons, one of whom, John, accompanied him on his voyages.

In May 1607, Hudson set sail on the *Hopewell* on the first of four voyages. The trip was financed by a consortium of London merchants known as the Muscovy Company in an effort to locate a shorter, northern passage from Europe to Asia. Departing England in May 1607, Hudson traveled north to the island of Spitzbergen and came within 600 miles of the North Pole. Treacherous weather prevented further exploration, and Hudson returned to England in the *Hopewell* that September. Although Hudson failed to find the route he was seeking, he did establish that there was far too much ice to pass over the North Pole to the Far East.

Hudson sailed on his second voyage on the *Hopewell* from London in April 1608, again underwritten by the Muscovy Company. This time he decided to seek a northeast passage by sailing along the northern coast of Siberia to the Pacific. The *Hopewell* sailed north along the coastline of Norway and into the Barents Sea. Hudson then attempted to reach the Kara Sea, but only reached Novaya Zemlya Island. Once again, inhospitable climate, ice, and storms, prevented further travel. Hudson returned to England in August 1608 with nothing to show for his efforts save walrus hides, tusks, and blubber.

By 1609, English interest in finding the Northeast Passage had dissipated, and Hudson's third voyage began in 1609 under the auspices of a company in Holland, the newly formed Dutch East India Company. His assignment was to sail around the northern shores of Novaya Zemlya, then head south in search of a northeast passage. Hudson embarked in March 1609 aboard the *Half Moon*. He made it as far as the North Cape (the northern tip of Norway) before weather conditions forced him to turn back.

Instead of returning to Holland, Hudson decided to ignore the Dutch East India Company's orders and to sail to the Atlantic Coast of North America, convinced that the way to the Far East lay through the northwest, not the northeast. Hudson was also persuaded by mutiny on the part of his Dutch crew, who had little desire to explore the extremely cold and icy regions of the north. Reaching the coast of North America, Hudson began an investigation of the coastline around Chesapeake Bay and then moved north. On September 12, the *Half Moon* entered a large river leading north, later named in Hudson's honor. Hudson returned to England in November 1609.

Hudson's fourth and last voyage was again under English employ, this time financed by the Virginia Company and the British East India Company. This time he received approval to seek the Northwest Passage. Toward that end, he had at his disposal a newer and larger ship, the *Discovery*. Hudson set sail with a crew of 23 men in April 1610.

Sailing west, Hudson reached Iceland in May, then skirted the southern tip of Greenland in June to continue west. At the end of June, the *Discovery* entered what later became known as Hudson Strait at the northern tip of Labrador and in early August it sailed into what became known as Hudson Bay. In November, the ship became icebound in James Bay and the crew moved ashore for the winter.

Hudson and his men faced severe food shortages and the test of fierce winter storms. Short of food, supplies, and adequate clothing and shelter, his crew succumbed to scurvy and frostbite. With the arrival of spring, Hudson wanted to continue explorations, but on June 22, 1611, most of the crew mutinied and set Hudson and several other crew members, including his son Richard, adrift in a small boat. The mutineers then sailed for England, where they were subsequently tried and acquitted. Hudson and the others were never seen again.

Hungry March

Start Date: January 26, 1676 End Date: February 1676

Name given to the effort by the New England colonists to capture retreating Narragansett natives during King Philip's War. In the aftermath of the Great Swamp Fight of December 1675, both sides, colonial and native, disengaged to assess the situation. Despite the success of the colonists in the Great Swamp campaign against the Narragansetts, it brought into the conflict an entirely new group of

enemies, as this previously neutral tribe now openly joined the other New England tribes under King Philip (Metacom).

Acting on intelligence from prisoners that a large number of Narragansett Indians were moving in the direction of King Philip's winter headquarters, colonial military leaders began their preparations for a pursuit. The Army of the United Colonies, comprised of veterans of the Great Swamp battle along with many fresh recruits, numbered between 1,400 and 1,600 men.

Led by Gov. Josiah Winslow of Plymouth, the colonial force set out on January 26, 1676, moving northwest toward Nipmuck territory. Along the way, the army witnessed the wrath of the natives, coming upon numerous devastated homesteads. Occasionally, advance detachments of scouts encountered small native raiding parties and killed or captured a number of natives. The main force, however, was always too late to catch up with and engage the main body of natives.

Because of the harshness of the winter season and the distance from their base, the colonials were critically short of supplies, especially food. Severe cold and icy conditions during the march only made the situation worse, and the men suffered greatly. At one point they were forced to kill and eat their own horses in order to keep from starving.

After chasing the natives some 70 miles in steadily worsening winter conditions with no hope of catching the main body, and with his own forces freezing and near starvation, Winslow gave up the chase and released the men in early February to return to their homes. The retreating Narragansetts soon joined with the other tribes fighting with King Philip, strengthening his cause. Although many in New England criticized the expedition as a failure, the participants in what came to be known as the Hungry March knew they had done their best.

Hurons

Confederation of Iroquoian-speaking native peoples who lived north of Lake Erie, and along the shore of Lake Huron's Georgian Bay. Although Jacques Cartier did make contact with Iroquoian-speaking natives along the St. Lawrence River during his explorations in the 1530s, it is impossible to ascertain if they were ancestors of the Hurons. However, Samuel de Champlain did encounter them in the early 17th century.

The Hurons attracted French attention because of their numbers and long-range trade practices. Indeed, the Huron trading circle extended north to Hudson Bay and west to Lake Superior. Subsisting mainly by agriculture, the Hurons produced enough maize (corn) for trade with their neighbors, and the French quickly realized the value of the Hurons as trade partners. Knowing that the French would need the pelts that the Hurons would funnel to them, Champlain reluctantly joined them in an offensive against the Five Nations in 1609.

Eager to ensure that the Hurons would remain allied to them, the French sent missionaries to live and work among them as early as the 1620s. The trade relationship worked well for the French, as the Hurons acquired thick, high-quality pelts from their native trade partners and traded them to the French for European trade goods such as woolens and iron tools.

However, the activities of the French missionaries tended to cut both ways. Although the Jesuits did gain many converts, they also made enemies of Huron shamans, who encouraged people to resist the Christian message. In order to minimize the influence of the shamans, the Jesuits established separate villages where Huron Christians could live without the influence of their unconverted brethren. Unlike the so-called praying towns established by New England Puritans, Hurons could come and go in these villages as they pleased and did not have to surrender their cultural identity.

The trade relationship with the French benefited the Hurons greatly, and some historians have described the Hurons as middlemen in the fur trade. The Five Nations of the Iroquois attempted to gain part of the fur trade, mainly by pilfering Huron trading canoes, and redirecting the booty away from Montreal to their Dutch trading partners at Fort Orange.

From the 1630s on, Huron fortunes ebbed. At the time of contact, there were an estimated 20,000 Hurons living in some 20 towns. But large-scale epidemics of European diseases and war with the Iroquois had cut their numbers in half by 1650.

The Five Nations launched a series of devastating attacks in 1649 and 1650, destroying whole towns and carrying many Hurons off into captivity. Shaken, Huron leaders—over Jesuit objections—decided to abandon Huronia and relocate to Ganadoe (now Christian) Island in Georgian Bay. However, the soil there was too poor to support large plantings of maize, and many Hurons perished of starvation over the next year.

From Ganadoe Island, many Hurons fled west to the upper Great Lakes and the Ohio Country, joining native communities in those regions. Others migrated east to live near French colonists in Quebec, and still others sought out and surrendered to the Iroquois, being adopted and assimilated into their nation.

Île-aux-Noix

Island fortification in the Richelieu River situated at its exit from Lake Champlain, built by the French to protect Montreal some 25 miles distant. At the time of the French and Indian War (1764–1763), the best way to travel from Lake Champlain to Montreal was by sailing up the Richelieu River, for there were no trails capable of accommodating a large military force.

In 1759, British troops under Major General Jeffery Amherst captured France's Fort Carillon (renamed Fort Ticonderoga) and

Map of Île-aux-Noix in the Richelieu River, ca. 1760. (Library of Congress)

Fort St. Frédéric (Crown Point). Amherst's next objective was to capture Île-aux-Noix, a task he assigned to troops under Brigadier General William Haviland. Haviland was unable to begin the expedition until August 11, however, because of difficulties moving supplies from Albany to his force at Crown Point.

Louis Antoine de Bougainville commanded a force of 1,450 men at Île-aux-Noix. The French had two ships supporting their defense on the river and they had also built dams to flood the shores along the river.

Haviland's force arrived at Île-aux-Noix on August 16. It took several days to place the siege artillery, but bombardment of the island commenced on August 19. It continued until Bougainville withdrew his force. Bougainville's withdrawal came not so much from the bombardment, but a British raid. On August 23, Haviland ordered Robert Rogers and his rangers to take three artillery pieces and move downstream of Île-aux-Noix, where they opened fire on the two French ships. The French had not anticipated such a maneuver, which they believed to be impossible because of swamps. Rogers's bombardment forced the French ships ashore, where they were captured. With the loss of these vessels, Bougainville could not stop the British from bypassing his position and cutting it off from Montreal. Thus he was compelled to evacuate his troops, which he did on the night of August 27–28, marching them to Montreal.

Illinois

Algonquian-speaking tribes living in the upper Mississippi River Valley in present-day Ohio, Illinois, Missouri, Iowa, and Wisconsin. The Illinois tribes comprised the Kaskaskias, the Cahokias, the Peorias, the Tamaroas, and the Michigameas.

During the 17th century, the Illinois suffered heavy losses from the Beaver Wars as the Iroquois drove tribes, including the Potawatomis, the Miamis, the Kickapoos, the Sauks, the Fox, and the Osages, out of the eastern Great Lakes. Their encroachment onto Illinois lands forced the Illinois to relocate in present-day southern Illinois along the Ohio River and its tributaries. The French first established contact with the Illinois in 1667 as Jesuit priest, Claude Allouez, was traveling to Chequamegon Bay on Lake Superior and encountered Illinois fur traders. In 1673, Jesuit Jacquette Marquette and fur trader Louis Joliet established contact with the Illinois while exploring the upper Mississippi River, and in 1675 Marquette returned to establish a mission among the Illinois at Grand Kaskaskia near present-day Utica.

An 18th-century depiction of Illinois Native Americans passing the peace pipe with settlers in the early 1700s. (Library of Congress)

By the beginning of the 18th century, the Illinois had lost most of their traditional lands and were reduced to territory along the Mississippi River and Illinois River. The Illinois joined forces with the French in the Fox Wars, which would see the Illinois settle old scores with their Fox enemies. Illinois warriors from the Peoria band participated in the Detroit massacre of the Fox, which in turn led to a cycle of revenge between the two tribes. Although the Illinois prevailed in battles with the Fox (who were almost wiped out), they lost many of their warriors.

In the aftermath of the Fox Wars, the Illinois became even more dependent on the French and as a consequence would suffer heavy losses while fighting alongside the French in the Chickasaw Wars. As other tribes sought to take advantage of their increased weakness, the Illinois sought protection from the French. The Peoria band, for example, relocated at the French mission at Kaskaskia. Although the Illinois had fewer than 500 warriors left by the outbreak of the French and Indian War in 1754, they remained loyal to the French and participated in attacks against British settlements in Pennsylvania and Virginia. While participating in Major General Louis-Joseph, Marquis de Montcalm's, campaign in northern New York in 1757, Illinois warriors contracted smallpox, which they brought back to their villages, further decimating the tribe.

In May 1763, the Illinois supported Pontiac's Rebellion against the British. When Pontiac made peace with the British, the Illinois regarded this as a betrayal and murdered Pontiac when he visited Caholia in 1769. To avenge Pontiac's murder, the Ottawas, the Ojibwas, the Potawatomis, the Sauks, the Fox, the Kickapoos, the Mascoutens, and the Winnebagos joined forces against the Illinois, nearly wiping out the tribe. Approximately 600 Illinois survived and fled to Kaskaskia, and their enemies divided up their lands. In 1803, the Illinois ceded all claims to their homeland and placed themselves under U.S. protection. In 1818, the Illinois agreed to removal west of the Mississippi, settling first in Missouri in 1818, then in eastern Kansas in 1832. In 1854, the Illinois merged with the Weas and the Piankashaws and relocated with them in 1867 to northeastern Oklahoma where their descendants live today.

Impressment, Army

Impressment is the forcible recruitment of manpower or supplies for military service. It was the forerunner of modern-day conscription. In England, impressment was common by the colonial era and included the seizure of the poorest class of subjects as well as foreigners. After 1800, impressment was primarily restricted to the naval service in Britain, as desertion rates among impressed soldiers were very high. In Prussia, impressment became common in the 18th century. It reached its height under King Frederick II (Frederick the Great, 1740–1786), particularly in the recruitment of replacement troops while the army was on foreign soil. Virtually all of the European powers employed impressment to some extent during the colonial era.

Impressment was often used as a tool to remove undesirables from society. Most property holders and skilled laborers remained exempted by law. They could also bribe impressment officers to avoid service. Impressment was often carried out by press gangs, groups of men paid to find recruits by virtually any means and paid according to the number of recruits produced. Press gangs were an unpopular but accepted form of military recruitment. Nevertheless, local officials often openly opposed them by force of arms. Because pressed men received no bounty for joining military service, many chose to "volunteer" when confronted by a press gang in order to make the best of a bad situation. Impressment was often a last resort to raise manpower, for those forced into service by this means were usually undisciplined.

There were distinct drawbacks to impressment. Indeed, it filled the ranks of European armies with men ready to mutiny or desert at the slightest provocation. And it disrupted voluntary recruitment by lowering troop morale. By the 19th century, it had largely been replaced by conscription, in which each region was assigned a quota of acceptable military recruits to be procured by local leaders, often by offering service bounties.

In the American colonies, impressment was a common means to fill the ranks of militia forces for specific military expeditions. Impressed men were typically given the option to serve or to hire a substitute in their place. In many cases, militia commanders impressed more than the required number of recruits. They would then select from the pool of pressed men those who would actually serve. Sometimes they would allow the pressed men to share the cost of hiring a substitute to serve in their place. In certain instances, particularly during colonial wars with other European powers, British regular officers impressed members of colonial militias to fill the ranks of the British Army. These pressed men were often looked down upon by the regulars, who considered them undisciplined and unfit for military service.

Impressment, Navy

During the American colonial era, the British Navy manned its ships in wartime by both enlisting volunteers and impressing—or forcing—men into its service as sailors. Pay and living conditions were poor and discipline was often brutal, so invariably there were personnel shortages. Impressment dated to the Middle Ages, when select English ports had the duty of providing the Crown with ships and men in naval campaigns in exchange for special trading rights and privileges. The practice spread to the Western Hemisphere in the 17th century, but it never claimed large numbers of colonial seafarers. Rather, British Navy press gangs (usually groups of between 2 and 12 men led by a lieutenant) seized sailors in North America and the West Indies as needed to compensate for losses due to death, disease, and desertion. Impressment, despite its limited use in America, was always controversial. Not surprisingly, it inspired acts of fierce resistance.

Controversy surrounding impressment owed in large part to confusion over its legality in America. In 1707, Parliament passed legislation that banned impressment in America and the West Indies except for deserters. Known as the "Sixth of Anne," the law did not make clear whether it continued past the War of Spanish Succession (Queen Anne's War) in 1713. After sending conflicting signals about the issue, the Royal Navy resumed impressing colonial sailors during Britain's next series of conflicts in the 1740s. In 1746, Parliament omitted North America from a bill that banned impressment permanently in the British Caribbean.

The 1746 law added to tensions over impressment in colonial American seaports. In November 1747, the town of Boston erupted in a three-day riot against the impressment practices of Admiral Charles Knowles. The so-called Knowles Riot constituted the largest disturbance against British imperial authority in North America in the generation before the Stamp Act crisis. During the French and Indian War (1754-1763), British naval officers tried to avoid such confrontations by pressing men from colonial merchant ships off colonial ports. In order to procure sufficient men for Lord Loudoun's expedition to capture Louisbourg, after midnight on May 20, 1757, naval press gangs supported by 3,000 British soldiers roamed the streets of New York, seizing almost 800 men. This and other instances of impressments increased tensions between the British military and the colonists, and on several occasions press gangs encountered violent resistance in colonial ports. During the American Revolution era, press gangs caused additional riots, helping to further politicize

American seaport communities. The impressment of American seamen continued even after the American Revolution and was a leading cause of America's second war with Britain in 1812.

Indian Presents

The term used to describe goods designated as gifts for use in diplomacy between Native American peoples and European colonists throughout the colonial era. Because these goals were used by diplomats as well as traders who interacted with Native Americans, Indian presents are also referred to as Indian goods or trade goods. All European powers used presents in their diplomacy with native peoples.

Wampum (shell or other beads strung in the form of collars, girdles, belts, or strings) is commonly associated with diplomatic meetings. However, toys, fishing equipment, lead shot for firearms, knives, food, scalps, furs, tomahawks, rum, tobacco, clothing, and

other textiles were also used in these rituals of exchange between colonists and natives. Metal objects were particularly sought after by American Indians. These included such items as silver medals, gorgets (half-moon shaped or round plaques, and often worn on a string like a necklace), earrings, and rings. Iron axes and knives, and other small metal goods, such as thimbles, fish hooks, and bells, were likewise exchanged. Glass mirrors and glass beads were highly prized by native recipients, as were cloth goods like wool coats and blankets (often made of imported wool fabrics called stroud, duffle, and ratteen), and decorative accessories such as ribbons and handkerchiefs. Every type of European-style clothing was exchanged except for wigs and breeches. Mind-altering products such as tobacco, rum, and other alcoholic beverages were also used as barter. Also ivory objects and pigments for face painting are often listed in inventories of trade goods and presents.

Although some of the objects presented by traders and diplomats were of utilitarian value, they were also often highly

A contemporary cartoon of William Penn's "circumvention of the native" shows the statesman at work "burying the hatchet" with Native Americans who have offered a wampum belt in treaty. Penn is remembered for his respectful dealings with Native Americans. (Library of Congress)

decorative. They sometimes served the aesthetic needs or desires of the native recipients. Objects used for trade were both manufactured in America (silver and iron) and imported from Europe (textiles and beads). Many colonial forts and military encampments or expeditions counted craftsmen, capable of creating trade goods, among their numbers.

Although Indian presents were goods designated for diplomatic exchange between agents of the colonial governments and native leaders, the same types of goods were also used in purely economic exchanges. Gifts were often presented as part of reciprocal giving for diplomacy or were given to natives as military awards. In contrast, the goods used for trade were exchanged for furs or other items. Documents reveal that the types of goods used for Indian presents were also purchased by Native Americans, and some were even manufactured by native craftsmen for use within their own communities or for trade.

Presents were an essential part of native diplomacy and played a major role in colonial warfare and diplomatic relations with native peoples. Gift giving and reciprocity had been a routine part of native life before European arrivals and were often given to commemorate events like births, death, marriage, and ceremonies. They were also sometimes exchanged during council meetings and treaty parties. Gift exchanges acted as material signs of commitment to agreements made between groups. Often these agreements concerned access to land, trade rights, and other political matters.

Well versed in these gift-giving practices, many natives used presents to negotiate among European political groups and to maintain power in an ever-encroaching imperial world. From the earliest years of settlement, Europeans realized the importance of reciprocity with native peoples and quickly adopted the diplomatic practices of gift giving to achieve their goals for settlement and expansion in the New World.

These reciprocal exchanges of gifts continued throughout the colonial era. However, there was a significant rise in the number of gifts given between the late 1740s and the 1760s. This coincided with an increased level of contact and conflict between natives and colonists as encroachment onto native lands increased and colonial wars, particularly the French and Indian War (1754–1763), took place. In addition, there was a dramatic rise in the creation and use of certain types of goods, like silver objects, after the mid-1700s. After the 1760s, the price of many of these goods began to fall and the availability and variety of goods increased.

A number of Indian presents exist today in museum and private collections. Inventories and accounts in private manuscript collections and governmental records also record the variety of goods used. Indeed, they underscore the importance of Indian gifts for understanding colonial diplomacy, native-white relations, and westward expansion throughout the colonial era.

Infantry

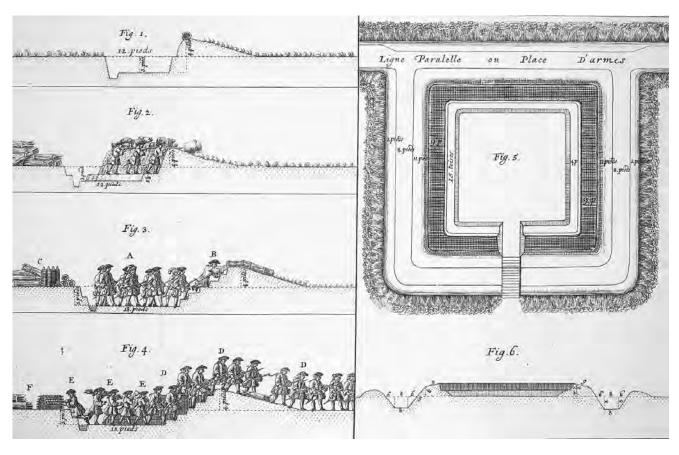

Military units that fight on foot, equipped with small arms. Infantry have existed from the beginning of warfare, but in the early 17th century Spain revolutionized European land warfare with the introduction of an improved matchlock musket and units of professional foot soldiers. These latter were known as "infantry," from the custom of adopting Spanish princes, or *Infantes*, as honorary colonels of various regiments. Originally composed of a combination of musketeers (*fusilieurs* in France) and pikemen who provided protection against cavalry attack, infantry provided both firepower and shock action, and they were employed both offensively and defensively.

In colonial North America, pikes—the long spears employed both to defend against cavalry attack and to disrupt enemy formations—proved largely ineffective, particularly in wooded areas when dealing with Native American adversaries on foot and armed with bows and arrows. In consequence, pikemen soon disappeared from the colonial order of battle. The pike was soon replaced in Europe, in any case, by the socket bayonet, which fit into a sleeve at the end of the musket barrel. In effect, every soldier was now a pikeman if needed.

In addition to musketeers and pikemen, there were also grenadiers, specialized infantry that appeared in the 17th century. The French were the first to introduce grenadiers, in 1667. They appeared in the British Army in 1678. Grenadiers were special assault troops equipped with grenades and often given the task of storming an enemy position.

Infantry came to be classed as line or heavy infantry for close combat and light infantry for irregular warfare. The largest basic tactical infantry unit was the regiment, commanded by a colonel. Regiments could be as small as a single battalion and so these two designations were largely interchangeable for the colonial period. The regiment or battalion was in turn divided into companies of 80 to 100 men commanded by a captain, then into platoons or firings (as contemporaries sometimes described them).

The size of the regiment and the number of companies varied widely from one unit to another, even within the same army.

French engraving illustrating infantry attacking a fortification, ca. 1766. (The Granger Collection)

Authorized strength usually put regiments at roughly 12 companies, the equivalent of between 800 and 1,000 men. Field regiments seldom numbered more than 850 officers and men, however. There were usually 8 to 10 line companies in a regiment, with grenadiers and later light infantry forming additional companies. Grenadier and light infantry companies were often removed from their parent units and combined with other like troops to form specialized formations.

In the fighting in North America new infantry formations appeared, the consequence of special challenges posed by terrain and climate as well as different enemies. These included not only provincial troops and militia but also rangers. The latter evolved as a response to the challenge posed by the Native American method of war (the "skulking way of war"), which differed markedly from that employed in Europe.

Officers and men came from two very different social strata. Officers in the British Army, as in the other European armies of the period, were almost entirely drawn from the nobility and most often purchased their commissions, save for the rank of general. Soldiers, on the other hand, tended to come from the lowest social classes. Often they were forced to enlist in lieu of imprisonment for petty crimes or were swept up by so-called press gangs. Recent studies have shown that at least in the British Army a number of

soldiers came from the artisan class who had fallen prey to economic downturns and were thus forced into military service from financial need.

All armies of the day relied on constant drill to produce automatic action under fire. Ferocious discipline was held necessary to keep the soldiers in line. Officers had absolute authority; any soldier who raised his hand against an officer was condemned to death, whereas officers were free from accountability toward their men. Floggings, beatings, and other punishments were imposed for the smallest offenses.

The common infantry firearm in North America was the flint-lock musket, which replaced the matchlock and harquebus at the outset of the 18th century. Easier to load and more reliable in fire, the musket could also mount a socket bayonet, which was often employed in the final stage of an assault. Officers carried edged weapons. Likewise, soldiers of infantry units in the first half of the 18th century were armed with a short sword known as a hanger, and the men of some grenadier units carried sabers.

Other equipment carried by most infantrymen apart from the rifle and bayonet were a cartridge box, a canteen, and a pack containing extra clothing and rations. The average soldier in the 18th century might be encumbered by as much as 70 pounds or more of extra weight.

In order to meet the demands of the terrain and climate in North America as well as its tactical requirements, troops modified their equipment. Thus the long coats typically worn by the British infantry in Europe were often shortened to jackets for service in North America. Hats, likewise, were cut off closer to the crown. Grenadier sabers were packed away. Even the Highland units sent to campaign in North America found it useful to replace their heavy wool kilts with pants. In New France, especially among the locally recruited militia, dress and tactics both resembled those of the Native Americans to a much larger degree than in other European colonies.

Eighteenth-century European infantry tactics stressed linear, tightly packed formations in order to produce the maximum fire-power on a similarly arranged enemy line. Firing occurred almost at dueling pistol ranges, for the smoothbore flintlock musket with its significant windage was largely inaccurate beyond 100 yards. The stress on volley fire made drill vastly important, as contemporary infantry manuals make clear. Individual action was usually impossible and in any case was strongly discouraged.

All armies of the colonial powers bore a general resemblance to one another, in equipment, in social composition, and in tactics. By the same token, each army adapted in various ways to meet the special demands posed by climate, terrain, and adversaries encountered in its colonial experience.

Infantry Tactics

Infantry tactics are the methods employed by foot soldiers in the prosecution of combat at the level of a skirmish or battle. The manner in which the infantry fought underwent a great deal of change in the period between the end of the 15th and the third quarter of the 18th centuries. To a large extent this transformation, a process so profound that a number of historians have labeled it a "military revolution," resulted from changes in technology.

Infantry tactics in Europe underwent a steady process of development. These combat methods underwent further transformation when Europeans arrived in North America and came into conflict with Native Americans. Terrain as well as the techniques of new foes played a role in these changes. Another factor in these developments lay in the goals of combat in the two regions. In Europe, the aim of a battle was usually to drive the opponent's army from the field. In North America, by contrast, the desired result in battles between Europeans and Native Americans was the extirpation of the opponent. Over time, especially in the French and English colonies, a hybrid form of tactics developed that featured a combination of European and Native American fighting techniques.

From the 15th century on, Europe witnessed increasing numbers of individual firearms on the battlefield. These weapons evolved, from the harquebus to the matchlock and finally to the flintlock musket and socket bayonet combination. Such improvements slightly altered the nature of infantry tactics so that firepower gradually replaced shock as the decisive element on the battlefield. Essentially, technological advances made it possible to kill enemies slightly more effectively with projectiles at a distance than with brute strength in hand-to-hand combat. In the last stage of development in the period, the combination of musket and bayonet enhanced the versatility of the infantry by allowing it to switch rapidly from a defensive to an offensive posture. For instance, infantry could use the fire from their muskets to break an enemy line, or resist a charge from enemy infantry or cavalry. Bayonets were employed at close quarters and were as important in the charge as the musket.

The roots of this tactical evolution began in Spain, where the units were known as *tercios*. Infantry *tercios* were organized with specific tasks in mind. This organizational reform laid the groundwork for future changes. Strides in infantry tactics and organization were made in the Dutch United Provinces under Maurice of Nassau. This prince is credited with the reintroduction of drill into early modern armies. Maurice's focus on having a well-drilled military force was one of the key factors enabling him to hold off the Spaniards in the Dutch Wars. Infantry tactics recognized the inherent inaccuracy of the smoothbore gunpowder weapons then in use by infantry. This forced commanders to employ massed fire at close range. It likewise led to the employment of volley fire on the part of many European armies, beginning with the Dutch.

Maurice's reforms focused precisely on increasing the rate of fire his soldiers were able to deliver. He achieved this by the musketry technique known as the countermarch in which successive ranks of musketeers fired a shot then moved to the rear to reload. The countermarch led to thick groupings of infantry, sometimes as many as six ranks deep or more. As each consecutive rank fired and marched to the rear, the entire unit gave some ground in the process. The countermarch, then, can be seen as more a defensive method of fighting. A continuing problem lay in the fact that mus-

keteers were essentially defenseless while reloading. They thus required large numbers of pikemen to defend them against cavalry attack. Even with these shortcomings, the tactical methods of Maurice of Nassau played a significant role in the winning of Dutch independence from Spain.

In the early 17th century, the Swedish warrior-monarch Gustavus Adolphus adopted the countermarch technique from the Dutch, and he employed pikemen to cover the musketeers in case of cavalry attack. Likewise, he employed the countermarch as an offensive tactic by training his men to advance and shoot as well as shoot and retire. Gustavus introduced many changes, including lighter, standardized artillery. Such innovations, as well as others in army organization, led to the great Swedish successes during the early part of their involvement in the Thirty Years' War.

Technological advances on the battlefield gave rise to tactical reforms as well. Tactics became linear as musketeers lined up on the battlefield to trade mass volleys of gunfire. These musketeers were interspersed with pikemen who defended them from cavalry attack. As the numbers of muskets increased and they became more reliable, the ranks of massed infantry thinned and extended. By the 18th century, three to four ranks were the norm, rather than the earlier six. Likewise, the pike largely disappeared, for the socket bayonet, which fit on the end of the musket, made every musketeer his own pikeman.

But fighting in North America was vastly different from that in Europe, with its cleared, open fields. Most of America was wooded and the terrain was in places difficult. The natives took advantage of their knowledge of the land and used cover and concealment and stealth. Seldom were there large pitched battles in the open.

The Spanish were the first Europeans to have significant contact with the Native Americans. In their first warfare with the Native Americans, the Spanish tended to rely on edged weapons in close combat. Although they possessed firearms, they were in such small numbers that they did not play a decisive role. The psychological effect attached to the discharge of gunpowder weapons, however, was of great value in breaking the morale of native opponents. Wherever possible, the Spanish tended to augment their forces with native allies. The European pike, however, proved all but useless in the woodlands of America and it largely disappeared as a weapon.

Once the French and the English came into contact with Native Americans, it quickly became apparent that although European weapons technology was certainly superior, the tactics of some native groups often more than compensated for this. Fighting in open order, Native Americans did not present a ready target for massed, volley fire. In addition, Native Americans often attacked from ambush and concealment, and they spread their forces.

Terrain was an important factor. Much of North America was covered in dense old-growth forests and underbrush. Paths were few and narrow. Tightly packed European infantry columns made an appealing and easy target for ambushes. The colonists learned to adapt to these native tactics and use them as their own. Ranger units emulated native raiding parties.

The colonists also employed aimed fire to much greater degree. The rifle was an ideal weapon for this sort of warfare, though it did possess some major drawbacks. Its chief shortcoming was the increased time in reloading over the musket. In addition, most rifles were manufactured for hunting and thus lacked a lug for mounting a bayonet.

During reloading, riflemen were virtually defenseless. To compensate, in many instances frontiersmen fought in pairs to allow one man to reload while another fired. To make their fire more effective, many frontiersmen began to employ a combination load known as buck and ball in which they loaded a musket ball with several rounds of buckshot in order to make the most of their first volley.

Thus, colonial fighting tactics were a blend of European and Native American methods. Not only did the means of firing change, but the way in which infantrymen moved into combat changed as well. Again, this transformation was the result of the combination of terrain and native tactics. To adapt to the narrow paths and reduce the possibility of ambush, militias and provincial troops began to mimic the practices of their native opponents and march single file. This practice came to be referred to as "Indian File."

The evolution in military practices that characterized the period known in the West as the military revolution had profound effects on the tactics employed by Europeans in their earliest conflicts with Native Americans. European technology was certainly superior, but for that superiority to tell, it required a fair amount of tactical adaptation. Even as tactics changed in Europe to assimilate the new technology, they changed in America to confront the realities imposed both by terrain and a new opponent.

Ingle, Richard

Born: ca. 1609 Died: 1653

Merchant and ship's captain who took control of the government of the colony of Maryland in 1645. Born in Redriff, Surrey, England, around 1609, probably in a middle-class Protestant family, Richard Ingle became a merchant trader and ship captain. In the 1630s he became active in transporting goods from Maryland to England, especially tobacco.

When the English Civil War began in 1642, Ingle sided with the Parliamentary forces. This put him at odds with the Catholic leaders of Maryland. Acting on charges brought from a rival trader, no doubt financially motivated, that Ingle had insulted King Charles I, in January 1644 the overly zealous and not terribly politically astute Giles Brent, acting governor in the absence of Gov. Leonard Calvert, ordered Ingle arrested on a charge of high treason and his pinnace, the *Reformation*, and all of its goods, seized. Allowed to board his ship in the company of a sheriff, Ingle and several of his men seized control of the vessel and put their guard ashore. They then set sail. At the mouth of the St. Mary's River, Ingle captured several small ships and took their guns and some goods. He told their crews that he would attack and destroy the dwellings of prominent Marylanders, including that of Brent. It was not a hollow boast.

Having prevented any immediate pursuit, Ingle set sail for England. Still angered over what had transpired, in late December 1644 Ingle returned to Maryland in the *Reformation*, bearing with him a letter of marque and reprisal from Parliament that authorized him to cruise the waters of the Chesapeake and seize all ships and vessels and their goods belonging to those hostile to Parliament. Ingle now had authority to wage war against the supporters of King Charles I.

Recruiting local sympathizers, on February 14, 1645, Ingle attacked and seized the Maryland capital of St. Mary's. He also took as prisoner Brent and other Maryland leaders. Calvert managed to avoid capture and to gather sufficient armed supporters to establish a stronghold nearby.

Calvert, however, could not prevent Ingle and his supporters from pillaging and burning the homes of wealthy Catholics and royalist supporters, including a large property on St. Inigoes Creek belonging to Thomas Cornwaleys, the richest man in Maryland. Ingle cloaked his vindictive plundering in the mantle of duty to Parliament, but many Marylanders regarded him as little more than a pirate, calling him "that ungrateful Villaine." This episode is known in Maryland history as the Plundering Time. After 14 weeks, and having done about all the damage he could, in early April 1645 Ingle set sail for England, taking with him the Dutch trading vessel *Speagle*, which he had previously promised to return to its master, much plunder, and two Jesuit priests in chains. Ingle's supporters in Maryland formed a provisional government loyal to Parliament.

Sporadic fighting occurred in Maryland thereafter, until late 1646, when, with aid sent by Gov. William Berkeley of Virginia, Governor Calvert managed to reassert his control over the colony, bringing to an end Ingle's Rebellion. The restored government specifically excluded Ingle from its amnesty proclamation.

Later taken to court in England, Ingle was ordered to pay reparations to some of those whom he had plundered in Maryland, chiefly Cornwaleys. Ingle died in 1653.

Intercolonial Relations

The colonial wars of prerevolutionary North America decisively influenced political and military relations among the 13 English colonies as well as their relationship with the mother country. In seeking cooperation, the colonies had to overcome barriers arising from differing origins, religious values, ethnicity, economic and cultural development, governing structures, and increasingly, competition in the trans-Appalachian area for land, political influence, and trade with Native American tribes. In addition, the colonies had to respond to political pressure from the home government in London. How they reacted to military threats from the other colonial powers and their Native American allies and to British policy often reflected their differences. Facing outside danger, the colonies had only limited success in developing a cooperative framework, but their efforts laid a foundation for the nation that emerged from the American Revolutionary War.

The strongest influence on early relations among the colonies of English America was their differing origins and political, economic, and social development. They were founded separately, often by religious minorities from England and Europe and were influenced by changing political circumstances in Britain. They also developed in vastly different political, economic, social, and geographical conditions.

In this context, individual colonies fought the earliest wars against Native Americans independently of one another. These conflicts sprang from local conditions and could be carried out with local resources. A New England confederation for defense (minus

Rhode Island) was organized in 1643 partly in response to Native American violence during and following the Pequot War (1636–1638), but it collapsed after King Philip's War (1675–1676). Thus the Pequot War and King Philip's War were fought by New England colonial militias financed largely by their own communities. Dutch soldiers and a few mercenaries fought the Dutch-Indian Wars (1641–1664) with only limited support from the Dutch West India Company. Jamestown colonists fought a continuing 30-year struggle with the Powhatan Confederacy beginning in 1610. Although these conflicts placed a continuing strain on the financial and manpower resources of the colonies involved, they were nevertheless able to sustain the costs. England, beset by religious strife and civil war, provided little money and few men.

The emerging threat from French Canada in the late 17th and early 18th centuries along with a corresponding surge in French-instigated American Indian violence on the northern and southern frontiers made the need for more cooperation among the colonies readily apparent. The military failures of the New York and New England colonies in King William's War (1689–1697) revealed the need both for cooperation among the colonies and more involvement by Great Britain. The English colonists bungled two major expeditions against Montreal and Quebec in 1690 and 1691 largely because of political squabbling within and between colonies over control of resources, financial support, and manpower.

As the largest contributor of both men and money, Massachusetts resented the indifferent performance of New York, Connecticut, and Rhode Island. New Yorkers, for their part, having exhausted their financial resources in the failed overland expeditions of 1690 and 1691, unsuccessfully sought loans from Massachusetts and Virginia. And all of the colonies involved resented the London authorities for embroiling them in a war of unprecedented cost and violence without providing them with direct military and naval support. The only attempt at cooperation was an April 1690 meeting in New York City—a meeting convened to organize the offensive against French Canada and respond to Native American attacks on the northern frontier.

Queen Anne's War (1702–1713) raised the same concerns. This conflict involved not only the northern colonies but also the Middle Atlantic and southern colonies. The strongest efforts at intercolonial cooperation came again in the north. In 1706, New England officials persuaded most of the English colonies to provide men or money for an expedition against French Canada. The effort faltered because England failed to furnish troops and ships. Later attempts at cooperation, sustained by small military and naval units from Britain, led to limited successes against Acadia (Nova Scotia). For the most part, however, the colonies mounted their operations independently.

The subsequent colonial wars of the early to middle 18th century followed this same pattern. The colonies attempted cooperation when military necessity dictated it, but these efforts were constantly plagued by political factionalism, self-aggrandizement,

and economic competition. The lack of coherence proved a hindrance to relations between English America and their strongest Native American allies, the Iroquois Confederation.

The threat from French Canada and its Native American allies in the north and the west was a continuing concern for the colonies and for policymakers in London. The strongest effort to strengthen colonial unity and formulate a unified policy toward the Iroquois came in 1754, on the eve of the French and Indian War (1754-1763). A combination of French encroachments and Iroquois discontent with American trade and land policies finally led the home government to act. In July, the colonial governments of New York, New Hampshire, Massachusetts, Rhode Island, Connecticut, Pennsylvania, and Maryland, on orders from London, sent representatives to a conference at Albany to address ways to improve relations with the natives and promote frontier defense. Even with war imminent, however, the colonies had difficulty seeing beyond their own interests. Their selfishness was apparent in matters of frontier defense. When New York delegates sought financial help to build forts along their exposed northern frontier, New England representatives balked at paying for forts that would do nothing for their own security. Thus they failed to agree on a common policy toward the Iroquois because of conflicting interests in the Native American trade and land speculation.

Nevertheless, the Albany Conference went further than any previous effort toward fostering colonial unity. The delegates agreed on strengthening frontier fortifications (although not on how to finance them), the consolidation of native policy under a single superintendent, and Crown control of the acquisition of Native American lands. Most significantly, a committee chaired by Benjamin Franklin proposed the Albany Plan of Union that would have created a grand council elected by the colonial assemblies and a president-general appointed by the Crown. This measure would have centralized control of Native American policy, external affairs, and the common defense in one governing body. The plan foundered in the colonial legislatures, however. Although it set an early precedent for American union, its short-term failure meant that Britain would have to bear the burden for fighting the French and Indian War, the costs of which the mother country would try to pass on to the colonies with momentous consequences.

Iron Act

Event Date: June 24, 1750

Attempt by Great Britain to control the iron industry in British North America. The British Parliament passed the Iron Act in 1750. In effect from June 24, 1750, it was designed to promote the export of American iron to England while restricting the iron manufacturing industry of the American colonies. At the time, the British government practiced an economic policy known as mercantilism. Under it, the British colonies were encouraged—and sometimes forced—to purchase manufactured goods from the mother country. In turn, they were expected to provide the latter with raw materials, agricultural products, and minerals.

By the early 18th century, the British imported most of their iron from Sweden and Russia, which raised concerns about dependence on foreign sources. Under mercantilism, the British hoped to eliminate this dependence by either developing domestic sources or relying on colonial production. To avoid any supply disruptions that might arise from war or other crises, the British government opted to secure iron from its American colonies.

Fortunately, iron ore proved to be abundant in the American colonies. John Winthrop Jr. opened the first working iron furnace in Lynn, Massachusetts, in 1643. The furnace could produce up to eight tons of pig iron a week. American colonists required iron for the production of farm tools, kitchen utensils, and other products, and by the mid-18th century, iron furnaces and forges emerged in nearly every colony to exploit the resource and produce goods that were in constant demand. The southern colonies tended to produce raw iron ore whereas the northern colonies specialized in manufacturing products from the metal.

Parliament attempted to slow the growth of the iron manufacturing industry and spur the production of iron ore with the passage of the Iron Act in 1750. The act permitted the reduced-duty importation of American pig and bar iron needed by British industry. Colonial goods domestically manufactured with iron could be sold only in the colonies in which they were made. This was meant to restrict the intercolonial iron trade and increase imports from England. The construction of new iron mills, furnaces, or forges was forbidden. By 1757, the British eliminated all duties on the importation of American iron. The Iron Act proved difficult to enforce in the American colonies and the British tended to ignore it through an unofficial policy known as salutary neglect.

The American colonists did appreciate the eager British markets for iron as guaranteed under the Iron Act. Nevertheless, they resented the fact that London held a buyer's monopoly and could dictate prices. Nor did the Americans like Parliament's attempt to stifle manufacturing and intercolonial trade with the Iron Act. Despite the Iron Act, however, the iron industry grew quickly in the colonies, and the total number of American furnaces and forges outnumbered those in England and Wales by 1775. American output of bar and pig iron exceeded the production totals of Great Britain at the opening of the American Revolutionary War. Annual American exports of iron to Great Britain totaled 8,000 tons in 1770. Although the British tended to enforce the Iron Act rather loosely, its existence helped to fuel the colonial displeasure that would erupt into the American Revolutionary War a quarter of a century later.

Iroquois

At the time of European contact, the Iroquois Confederation, which consisted of five tribes—the Mohawks, the Oneidas, the Onondagas, the Cayugas, and the Senecas—was located in what is now upstate and western New York. A sixth nation, the Tuscaroras, joined the confederation in the 1720s. By virtue of their numbers, geographic location, and military reputation, the Iroquois served as a potent counterweight to the ambitions of both the English and the French in the North American Northeast for most of the colonial period.

The five Iroquois tribes lived in large villages, usually on easily defensible hilltops. Organized into clans that were headed by a matriarch, the Iroquois believed that in order to sustain spiritual and temporal power, captives had to be obtained to replace the dead. According to the founding myth of the Iroquois Confederation, the five tribes warred against one another until a supernatural being, Deganawida, and his human helper, Hiawatha, traveled among them, preaching a message of peace and unity. However, this message did not preclude the Iroquois from attacking other groups of native people, who were outside the "Longhouse," the traditional Iroquois dwelling that was used to metaphorically describe the confederacy. The founding of the confederation created something of a paradox, however. Although the Iroquois now lived in peace with one another, they increasingly

An 18th-century depiction of an Iroquois warrior. The Iroquois Confederation included six different tribal groups. (Library of Congress)

engaged other native peoples in warfare in an attempt to secure captives and strengthen their power.

Samuel de Champlain encountered the Iroquois on July 30, 1609, when his native allies encouraged him to join them in an expedition against the Mohawks, during which Champlain personally killed three warriors. Some historians have pointed to this small battle as the genesis of the century and a half of enmity between the Iroquois and the French.

For the rest of the 17th century, the Iroquois remained embroiled in conflicts with the French and their native allies, which occasionally were punctuated by brief truces. In order to maintain access to European trade partners to secure metal, cloth, firearms, and other items of European manufacture, the Iroquois fought other native people. The Mohawks forced the Mahicans to leave the vicinity of New Netherland's Fort Orange (now Albany, New York) after a bloody four-year conflict in the 1620s.

Unlike the Hurons, the Iroquois did not have direct access to the western Great Lakes and the regions south of Hudson Bay, where the best furs were to be found. Beginning in the 1630s and escalating in the 1640s, the Iroquois launched attacks on Huron furtrading parties, taking both furs and captives. The rerouting of furs

to the Dutch traders at Fort Orange, and away from the French in Montreal, threatened New France's economic survival.

The French and the Iroquois remained locked in conflict that varied in intensity for much of the 17th century, but this hostility actually helped the other economically. The Iroquois served as a barrier that separated northern Native Americans from the Dutch at Fort Orange and their high-quality and reasonably priced trade goods. Northern natives, who had access to higher quality pelts, were forced to trade with the French in order to obtain European goods. Thus, the Dutch could not obtain better quality furs, save for those the Iroquois pillaged from other native peoples.

In the late 1640s, in need of captives to replace the dead, and wanting to gain the Hurons' "middleman" position in the fur trade, the Iroquois launched a series of attacks that destroyed two major Huron towns and prompted the Hurons to abandon their country, the majority of them becoming refugees throughout the Ohio Country and the western Great Lakes region.

The assaults against the Hurons, however, were only partially successful. Although the Iroquois gained an impressive number of captives—French Jesuits claimed that there were more non-Iroquois adoptees than natives among the Iroquois—they did not gain control of the fur trade. Instead, the focus of the trade shifted farther west, and peoples such as the Ottawas replaced the Hurons as middlemen. With the founding of the English Hudson's Bay Company in the 1660s, both the Iroquois and the French lost access to many of the high quality furs of the north.

The Iroquois did not give up on their attempts to gain control over the fur trade, however. From the 1640s to the end of the 17th century, they routinely attacked other native peoples in the Ohio Country and the Great Lakes. In the early 17th century, the Iroquois could easily obtain firearms from the Dutch, the English, or the Swedes. After the 1660s, other native peoples were at least equally well armed, and the Iroquois suffered horrible losses as a result. But this did not stop the warfare. The dead, according to Iroquois tradition, still had to be replaced.

Beginning in the 1660s, a series of events forced the Iroquois to reevaluate their position. In 1664, the English seized New Netherland without firing a shot. The English promised that they, like the Dutch, would be faithful trade partners and allies. But when a French expedition devastated Seneca villages in the late 1680s, the English provided no help. Iroquois warriors continued to die in large numbers as the Beaver Wars continued.

The Iroquois response to this was what has become known as the Grand Settlement of 1701. In two separate treaties, the Iroquois promised the French that they would remain neutral in any future conflict between France and England. However, in a separate agreement, the Iroquois informed the governor of New York that they would consider lending the English military assistance—provided that the English secure Iroquois hunting grounds in Ontario. The Iroquois, of course, realized that it was impossible for the English to fulfill this condition in 1701. Throughout the first half of the 18th

century, the Iroquois played the English and the French off against one another, threatening to join one side or the other, and receiving gifts to keep them neutral or to encourage them to join in a war (which they never did).

The 1701 treaties, however, did not diminish Iroquois influence, particularly among the English. For years having dealt almost exclusively with the colony of New York, the Iroquois also formed an alliance with the colony of Pennsylvania, evicting the Delawares (Lenni Lenape) on the colony's behalf after the fraudulent "Walking Purchase" of 1737. But the Iroquois did not always enjoy good relations with the English. Indeed, in the 1720s they tried to persuade the Delawares and the Shawnees to join them in a war against the English. Both tribes refused to take part, and the scheme was never put into effect.

The Iroquois became more useful to the English as time went on. The Confederation claimed that they owned the lands comprising the Ohio Country, and the British government, arguing that the Iroquois were their subjects, used this claim to assert that they held legal title to the region. The French, however, also claimed the area. Iroquois diplomats oversaw some of the Delaware and Shawnee towns in the area, and their presence caused some resentment among some of these peoples. Offered a chance to join the French, and the possibility of regaining their lands, many of the peoples of the region went to war against the English.

For the most part, the Iroquois sat on the sidelines and watched as English forces performed poorly in the early phases of the French and Indian War (1754–1763). Despite being given wagonloads of gifts at the 1754 Albany Conference, most Iroquois, with notable exceptions such as the Mohawk sachem (chief) Hendrick, chose to remain neutral.

In the later phases of the war, as the British began to win some significant victories, the Iroquois entered the conflict on the side of the Crown. Realizing that a British victory could mean the eviction of the French from the continent, the diplomatic maneuvering that served the Iroquois so well for half a century would be useless. The next best thing was to be on the winning side, and then to later remind the English of their usefulness as allies.

After the French and Indian War, Iroquois relations with the English remained unsettled. The Senecas sent a war belt to the western tribes in an attempt to raise a rebellion against the English, but none accepted. In the 1768 Treaty of Fort Stanwix, the Iroquois ceded most of present-day Kentucky and Tennessee to the British, which led to conflicts when colonists entered the region and came into conflict with Cherokees, Shawnees, and other peoples who lived there.

With the beginning of the American Revolutionary War in 1775, most of the Iroquois decided, initially, not to become involved in what they regarded as a family dispute. However, British partisans like Joseph Brant (Thayendanega) of the Mohawks, and Sir William Johnson's successor as Britain's agent to the northern tribes, Guy Johnson, were able to make a compelling case that an American victory would not be in the best interests of the confederation. The

Onondagas and the Oneidas however, chose to side with the Americans, rupturing the Iroquois league.

Iroquois Confederation

The Iroquois Confederation was made up of different Native American nations that inhabited present-day upper and western New York state. Originally the league consisted of five closely related linguistic tribes: the Senecas, the Cayugas, the Onondagas, the Oneidas, and the Mohawks. In 1721, the Tuscaroras, who migrated from North Carolina, joined. Only the French called these people the Iroquois; the English referred to them as the Five Nations, then the Six Nations, or simply used the individual nation name. Within the confederation itself, however, the preferred self-descriptor was *Haudenosaunee*, meaning "People of the Longhouse," "the extended house," or "the whole house." Most scholars date the confederation from 1570, although some have it beginning far earlier. Iroquois oral tradition recounts the story of how two prophets, the Peacemaker and Hiawatha, brokered a peace to reduce conflict and bring the *Haudenosaunee* together.

Rarely did the members of the confederation act as a single unit. Rather than present a unified front to the French or the English, the confederation's primary purpose was to maintain peace among its component nations. Within the confederation, the village rather than the nation was the primary political unit.

Throughout the mid-1600s, the Iroquois became entrapped in a series of conflicts, known as the Beaver Wars or the French and Iroquois Wars, that were essentially struggles for control of the fur trade. In the 1640s, the Iroquois attacked Huron towns along the St. Lawrence River and by the end of the decade had displaced the inhabitants. During the latter half of the 17th and throughout the

18th century, however, the confederation suffered many setbacks. The Five Nations lost their Dutch trading partners as a result of the Second Anglo-Dutch War of 1664–1667, and at the same time they faced invading French troops, who burnt a number of Mohawk villages. This was followed by French-Huron attacks against the Senecas in 1687, the Mohawks in 1693, and the Onondagas and the Oneidas in 1696. The confederation sued for peace in 1698 and signed the Grande Paix in Montreal in 1701, bringing to a temporary end a century of nearly continuous conflict. The confederation then allied with the British, although it remained largely neutral throughout the first half of the century. Its component nations did, however, eventually side with Britain against the French during the latter years of the French and Indian War (1754–1763).

The final blow to the confederation came as a consequence of the American Revolutionary War. At first neutral, the Six Nations eventually divided their loyalties between the Patriots and Britain. After the conflict, many Iroquois migrated to Canada; those who remained had to contend with the expansionary land policies of the United States. Those who remained of the Six Nations played only a very limited role in the wars of the Northwest Territory that followed.

Iroquois Treaties of 1700 and 1701Event Dates: September 1700 and August 1701

Agreements between the Iroquois and the French (September 1700) and the Iroquois and New York colony (August 1701). By the

end of the 17th century, the Iroquois Confederation had been significantly weakened. Suffering from the losses sustained during the Beaver Wars (1641–1701) and King William's War (1689–1697), the Iroquois began to search for a way out of their predicament.

For much of the Beaver Wars, the Iroquois dominated their native enemies to the west. The Iroquois combined the economic motives for control of the fur trade with the traditional impetus of the Mourning War, which sought to replace their dead with captives. By the 1690s, however, Iroquois enemies were at least as well equipped in European weaponry as were they. With the disappearance of their heretofore technological advantage, the Iroquois began to sustain heavy losses.

The excessive number of casualties left the Iroquois vulnerable to attacks by their native enemies and the French. Indeed, in 1689 the French successfully invaded Seneca country, the westernmost portion of Iroquoia. There the French destroyed several Seneca towns and immense stores of maize.

The Iroquois also engaged in substantial fighting with the French during the 1690s on behalf of their English allies. However, the reaction (or rather, inaction) of the colony of New York to the French invasion taught the Iroquois a valuable lesson. Although the English may have been desirable as trading partners, as military allies, they were at best unreliable.

The Iroquois hoped to end the conflicts with the French and their native allies, yet their English allies restrained them from doing so. In 1698, English diplomats attempted to negotiate peace with the French on behalf of the Iroquois. However, both the French and the English had claimed the Iroquois as subjects. The French realized that they could not parley with English representatives acting on the behalf of the Iroquois League. To do so would have implied that the Iroquois were subjects of the British Crown.

In September 1700, over English objections, the Iroquois negotiated a treaty with the French. Under the terms of the accord, the Iroquois Confederation promised to remain at peace with New France's native allies and to remain neutral in future conflicts between the French and the English. In this way, the Iroquois actually helped the French, who were in something of a difficult economic and diplomatic position. The fur trade, the economic underpinning of French Canada, was if anything too successful. Warehouses in Montreal were glutted with furs, with the inevitable result that France's native trade partners would now be paid less for their pelts.

The treaty with the Iroquois allowed the French to keep the Five Nations in place as a barrier between the English colonies and other native peoples. This helped preserve France's trade and, more importantly, its alliances with the natives. If other native people had been able to trade with the English at Albany, they would have discovered that they offered cheaper, better quality trade goods. The long-term result of that would have been disastrous for New France.

In August 1701, a year after the treaty with New France, the Iroquois parleyed with English representatives and signed a treaty with the colony of New York. Although the Iroquois did not pledge neutrality, they did deed to the Crown rights to lands in southern Ontario that they claimed were theirs "by right of conquest." However, to secure these lands, the English would have to wrest control of them from the French, something the Iroquois knew was impossible in 1701.

Taken together, the two treaties have come to be known as the "Grand Settlement of 1701" and formed the basis of Iroquois diplomatic policy for half a century. The two treaties allowed the confederation to pursue a policy of "aggressive neutrality" by which it extracted concessions from both the French and the English. The English valued Iroquois trade, whereas the French had to have free access through lands controlled by the Iroquois in order to have communications between their colonies in Louisiana and in Canada. The Iroquois also took advantage of the long period of peace to foster peaceful relations with their native neighbors to the west and the north. They also forged closer ties with the English colony of Pennsylvania, as a counterweight to New York. And they found that they were free to continue their wars against their smaller, weaker enemies to the south, with minimal English interference.

Jamestown

The first permanent English settlement in North America. Jamestown was founded on a peninsula protruding from the north bank of the James River in eastern Virginia. The settlement served as the epicenter of colonial Virginia and played an important role in conflicts between and among Europeans and Native Americans between 1607 and 1699. Interestingly, Jamestown (or James Town, as it was originally known) was a privately financed venture with a decidedly military flavor. It was established on May 14, 1607, by 104 settlers of the Virginia Company of London and derived its name from King James I.

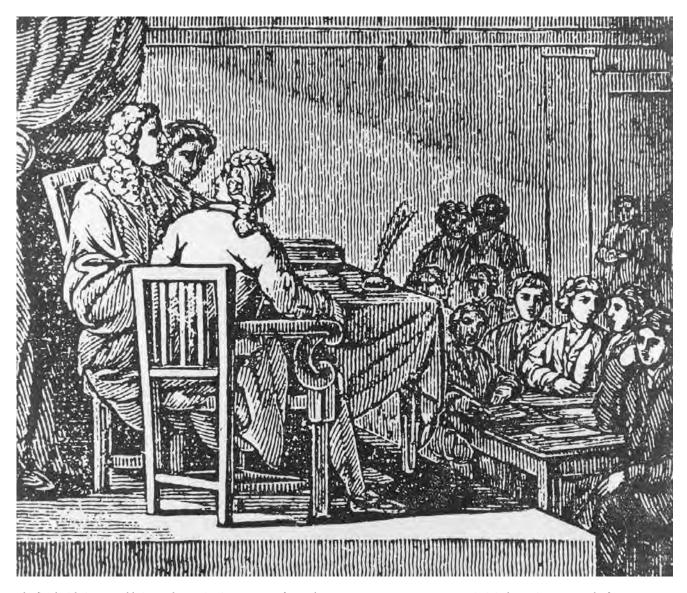

Investors hoped the colonists, carried aboard the ships *Susan Constant*, *Godspeed*, and *Discovery*, would either trade with or quickly conquer local Native American tribes and/or discover precious metals as a means of returning vast riches to England. Yet they feared the colony would provoke an attack by Spain, which claimed all of North America as its own. The investors therefore included a number of former soldiers among the colonists, and ordered Captain Christopher Newport to choose a site for Jamestown that was both hidden and easily defensible. Newport selected a peninsula five miles upstream of what settlers named the James River on terrain connected to the mainland by a very narrow neck of land. This site provided an obstacle to the landward approaches of Native Americans and made the new hamlet accessible to seagoing ships while keeping it far enough from the open ocean to avoid arousing the suspicion of passing Spanish ships.

Unfortunately, Jamestown had few other geographic advantages. The land was low and marshy, infested with disease-carring mosquitoes, and so close to the ocean that the adjacent river was a brackish, swirling stew of salt and fresh water that stagnated close

to shore. Because colonists dumped their waste into and drew their drinking water from the river in the same places, dysentery and other ailments ran rampant. Indeed, only 38 of the original 104 settlers survived the first nine months. And although new immigrants arrived to keep Jamestown going, colonists died so quickly that by 1610 only 60 out of 220 people who had arrived from England were still alive. Moreover, the early settlers were disproportionately gentlemen who hoped to get rich quickly and had no interest in working. They hunted and planted far too little to provide enough food for the winter, so that those who endured the heat, insects, and disease of the summer months often froze or starved to death the following winter.

Predictably, these abysmal conditions led to enormous infighting and desperation, which combined with racism to drive many colonists to mistreat nearby Native Americans whose gifts of food were the only reason some settlers survived. Captain John Smith famously brought order to the colony by imposing military discipline and forcing colonists to work six hours a day in 1608 and 1609. He also attempted to stay on good terms with the local Powhatan Confederacy.

All of this proved a brief respite, however, for his harsh measures provoked a revolt that, along with Smith's injury in an explosion, drove him from Jamestown and allowed the colony to descend into the "Starving Time" of 1609–1610. So many settlers died that Jamestown was briefly abandoned in the spring of 1610. When they encountered a relief expedition in Chesapeake Bay, the colonists returned and submitted to martial law under Gov. Thomas Dale and Gov. Thomas Gates, but long-term success came only after the discovery of tobacco as a profitable export, the establishment of a headright system that allowed private individuals to work their own

The first legislative assembly in North America, in Jamestown from July 30 to August 4, 1619. Jamestown, Virginia, begun in 1607, was the first permanent English settlement in America. (Library of Congress)

farms, and a gradual inland movement of settlers that took them away from the disease-infested coast.

As a military position, Jamestown began without fortifications of any kind, but after a raid by Native Americans in May 1607, the settlers built palisades made of upright logs and a triangular fort with turretlike emplacements for artillery at the corners. This was the first of many English forts in North America, and it served as a base during the first (1610–1614) and second (1622–1632) wars against the Powhatans and as a haven from attacks by other tribes such as the Kecoughtans, the Appomattocks, the Rappahannocks, and the Paspaheghs.

These Native American attacks were occasionally widespread, as evidenced by a colony-wide assault that left 347 settlers dead on March 22, 1622, and another in 1644 that killed more than 400. In each case the English exacted a terrible retribution, as in 1623 when

they lured 250 natives to their deaths with the promise of peace talks. Over time, the relentless influx of English settlers, their steady movement westward, catastrophic loss of habitat for wild game, and deliberate crop destruction by colonial forces destroyed Native American power in the region. The Algonquin tribes, for example, were reduced from an estimated population of 24,000 in 1607 to just 2,000 by 1669, and by the latter half of the 17th century tribes were forced to either accept English dominance or flee elsewhere.

As the center of economic power shifted inland, Jamestown gradually declined in importance. It was completely burned during Bacon's Rebellion in 1676, then destroyed yet again by accidental fire in 1699. At that time, a new capital for Virginia was established at Williamsburg, and Jamestown lay virtually abandoned thereafter.

Jemison, Mary

Born: ca. 1742

Died: September 1833

Pennsylvania frontier woman taken prisoner by Native Americans during the French and Indian War (1754–1763). Born about 1742 on a ship destined for Pennsylvania from Ireland, Mary Jemison worked on her family's farm in western Pennsylvania. On April 5, 1758, the Jemison family came under attack by Shawnee warriors and their French allies. Mary was the only family member to escape death. The Shawnees took her captive and subsequently turned the young

Statue of Mary Jemison near Portage, New York. Taken captive by Native Americans, she adopted native culture and remained with the Senecas the rest of her life, becoming known as "the White Woman of the Genessee." Her story, published in 1824, became immensely popular. (Library of Congress)

woman over to the Senecas. Two sisters cared for her and adopted her in place of their deceased brother. Jemison subsequently twice married Iroquois men and raised several children strictly according to native culture. Jemison fully assimilated into the Seneca culture and became a noted leader among her adopted people.

Although Jemison remained with the Senecas for the rest of her life, becoming known as "the White Woman of the Genessee," she retained fluency in English and later told her experiences to Dr. James E. Seaver, who published them in 1824. The immensely popular story was subsequently reprinted in many editions and remains the most complete single source for Native American captivity narratives from colonial times, although scholars dispute to what degree Seaver edited or changed Jemison's story in order to provide the moral lessons he believed it should impart. Jemison also indicated that she had withheld substantial portions of her life story from Seaver. These unanswered questions have given the text a life well beyond that of a true-life thriller or a morality play. Jemison died in September 1833 at a reservation near Buffalo, New York.

Jesuits

Roman Catholic religious order founded by St. Ignatius Loyola in 1534 in Paris, France, and dedicated to worldwide missionary work. The Society of Jesus, as it was initially called, was granted official approval by Pope Paul III in 1540. The 15th-century term "Jesuit," meaning one who used or appropriated the name of Jesus too frequently, was first applied to the society in the period 1544–1552. It was never employed by its founder, though members and friends of the society in time accepted the name in its positive sense. The Society of Jesus is a mendicant order of priests organized for apostolic work, following a religious rule, and relying on charity for their support. Jesuits played a leading role in converting Native Americans to Christianity.

Although Jesuits played an important role in the Spanish mission system, the order had its greatest impact in New France. As early as 1625, French Jesuits embarked on a vigorous missionary effort to convert the Native Americans of New France. There they were known by the Algonquins as "Black Robes." Jesuit missionaries in New France had spent most of their lives being educated in boarding schools and *collèges* (Catholic secondary schools) in Paris and Anjou, mastering Latin and Greek, logic, rhetoric, philosophy,

Jesuit missionaries encounter a range of reactions as they preach among Native Americans in New England. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

history, and theology. They then secured appointment to New France through liberal mortification of the flesh and persistent lobbying. Most missionaries did not remain at Quebec, Montreal, or the native *reserves* but were obliged by their order to live among the natives as a means of converting them once it became clear that it was the only way this could be accomplished. The Jesuits prepared themselves for this task by living among France's peasantry, mastering their rough dialects, and adjusting to their folkways.

Nothing could have prepared the Jesuits for the privations and ordeals of living among the American *sauvages* (savages). Ill equipped for life in the North American wilderness, the best a new arrival could do was to keep a low profile and observe, learning as best he could until he developed the strength and stamina to paddle a canoe nonstop for several hours, carry it in a portage, sleep on frozen ground in tight quarters, stomach the native cuisine, learn the elaborate customs, and—most important—speak the language such that he could be deemed a "man of sense" and an asset to that particular community. Only the rare missionary could gain the respect of the natives, and most failed—usually early on and due to an inability to master the native languages.

Years of experience allowed successful missionaries to prepare guides for those who would follow. Most notable of these Jesuits was Jean de Brébeuf, who placed a premium on learning the native languages, which was the route to gaining status in the tribe and coming to supplant the shaman as the community's spiritual leader. This in turn made it possible to begin converting the Native Americans

to Christianity. Once a certain esteem had been earned, the natives found much to admire among the priests, including their indifference to wealth, which favorably differentiated them from the greedy traders and merchants, their ability to withstand carnal desires (although this was puzzling to Native Americans), and their courage and ability to calmly endure discomfort that ranged from ridicule from their companions to bodily torture inflicted by their enemies.

Being bound by their order never to carry a weapon or shed blood was always considered a great liability, however, for the natives could never fully come to grips with a people who refused to take up a hatchet to defend oneself. The mastery of protocol meant that priests could become extremely important leaders in native communities, and the rare priest who did climb to such a height found religious conversion relatively easy. Jesuits' seeming imperviousness to the diseases that regularly ravaged Native American communities was taken as a sign of the highest morality and "right living," which further enhanced their status. However, each priest had to win his own victories, which did not add to the overall reputation of the missionaries or the French as a whole. The natives persisted in thinking themselves vastly superior to the Europeans in nearly every respect, and only a very few could be convinced otherwise and become Europeanized. The French Jesuits' efforts were studiously compiled into the formidable *The Jesuit Relations* (1632–1673).

From the Protestant British perspective, the Society of Jesus was a highly dangerous organization devoted to global proselytization as an arm of Spanish—and particularly French—imperial expansion in the 18th century. Outrageous stories about alleged Jesuit conversion techniques were told and retold throughout the Protestant world, and in the British colonies their success with native peoples was highly exaggerated as a goad to colonization of the North American Atlantic seaboard.

Johnson, Sir William

Born: 1715

Died: July 12, 1774

Noted British-born frontier trader, intermediary between North American colonists and Native Americans, and superintendent of Indian Affairs for the region north of the Ohio River (1754–1774). Sir William Johnson was born in 1715 in County Meath, Ireland, and arrived in North America in 1738 to manage his uncle's estates. Not long afterward, he established his own trading house in the Hudson River Valley, near Albany, New York.

Johnson soon developed a close association with the Mohawk tribe, the easternmost of the Six Nations, and learned the Iroquois language, customs, and diplomatic protocol. The Iroquois named him Warraghiyagey, which roughly translates to "he who does great things." Indeed, Johnson's relationship with the Iroquois and his deep knowledge of native diplomacy were the primary reasons the Crown appointed him superintendent of Indian Affairs in 1754, shortly after the beginning of the French and Indian War (1754–1763).

Adhering to the Grand Settlement of 1701, most of the Iroquois Six Nations remained neutral in the 18th-century imperial conflicts between France and England. However, this began to change when Johnson secured some influence with the Mohawks in the 1740s. During King George's War (1744–1748), the Crown appointed Johnson a colonel of the Six Nations. Working with the elderly Mohawk sachem Hendrick, Johnson was able to mount several military expeditions against French Canada.

Johnson further cemented his standing in the Mohawk community when in the 1750s he married into the prominent Brant family of the Mohawks, taking as his wife Molly Brant, one of Hendrick's female relatives (Johnson, however, referred to her as his house-keeper). As a clan matron, Brant wielded a great deal of authority in Mohawk governance. In fact, one of the primary reasons Johnson was appointed superintendent of Indian Affairs was the intense Mohawk lobbying effort on his behalf.

The poor performance of English forces in the early phases of the French and Indian War convinced most of the Iroquois to remain neutral. However, Johnson worked with his friend Hendrick to raise a force of Mohawks and colonial militia that defeated a sizable French force at Lake George in August 1755. The battle had a mixed outcome for Johnson. His old councilor Hendrick was killed during the fighting, but the Crown rewarded Johnson by making him a baronet.

For the reminder of the war, however, most of the Iroquois Confederation, including the Mohawks, chose not to join the English. In fact, much to Johnson's frustration, a good number of the Senecas, the westernmost of the Six Nations, sided with the French. But although he did not lead Iroquois warriors in battle, Johnson exercised his considerable diplomatic skills on the Crown's behalf, convincing many of the Delawares (Lenni Lenape) and the Shawnees to abandon the French and remain neutral. Not until the closing phases of the war, when British victory seemed assured, would the Iroquois join the British in large numbers.

With the end of the conflict in 1763, the new commander in chief of British forces in North America, Major General Jeffery Amherst, decided to stop the practice of gift giving with native peoples of the Great Lakes and Ohio Country, arguing that they should

Portrait of Sir William Johnson, who achieved great success as British superintendent of Indian Affairs for the area north of the Ohio River during 1754–1774. (Library of Congress)

not be bribed for good behavior. Johnson protested, arguing that gifts were a necessary part of native diplomacy. In 1763, partly as a result of Amherst's polices, Pontiac's Rebellion began, and Johnson was frustrated to learn that the Iroquois had little sway over the natives to the west. It was Johnson, however, who met with Pontiac at Oswego in 1766 and convinced him to make peace with the English.

For the last 10 years of his life, Johnson continued to exercise a great deal of influence in Native American affairs. He also closely mentored one of his kinsmen, Mohawk leader Joseph Brant. Johnson died during a conference with representatives of the Six Nations at his home, Johnson Hall, in New York on July 12, 1774.

Johnson, Susannah Willard

Born: ca. 1730

Died: November 27, 1810

English woman held captive by Native Americans and the French during the French and Indian War (1754–1763). Susannah Willard was born around 1730, probably in western Massachusetts. She married James Johnson and they lived just outside the Fort at Number Four at Charlestown, New Hampshire.

In a dawn attack on August 30, 1754, a group of Abenakis raided the Johnson home. The assault was the beginning of a life-changing saga that was similar for many of those captured along the frontier. The entire Johnson family (Susannah, her husband James, and their three children), Susannah's younger sister, and two other local men were taken. During her second day of captivity, Susannah gave birth to a girl. She and her husband named the child Elizabeth Captive Johnson.

Following an arduous trip, the family arrived at St. Francis, a native settlement in Canada. The Abenakis sold James, the two middle Johnson children, and the two local men to the French. Susannah, her daughter Elizabeth, and her son Sylvanus were adopted by the family of Joseph Louis Gill. Several months later, after living among the natives, whom she grew to respect, Susannah and the young Elizabeth were sold to the French. During their years in captivity, the Johnsons sought ransom money so that they could return home. They regularly petitioned various government entities in New France seeking better treatment and freedom. Finally ransomed, Susannah, her sister, and her two youngest children returned to New England in late 1757. James was also released and was reunited with his wife on January 1, 1758. Sylvanus arrived home in November 1758. Johnson's remaining captive child returned home in the late summer of 1760.

In March 1758, James joined the Massachusetts Militia. He died in the Battle of Ticonderoga in July 1758.

Susannah remarried in 1760 and published her account of the events she endured in 1796. Johnson (now Hastings) lived near Charlestown, New Hampshire, where she died on November 27, 1810.

Jumonville's Glen, Action at

Event Date: May 28, 1754

Battle between French and British provincial forces that marked the start of the French and Indian War. Following the 1748 Treaty of Aix-la-Chapelle, Britain and France attempted to negotiate an end to a border dispute between their North American empires. While the diplomats talked, British traders moved across the Allegheny Mountains into western Pennsylvania, and the French government in Canada attempted to protect their influence in the same area. Minor frontier squabbles gained new importance on April 15, 1754, when French forces evicted workmen from a nearly completed blockhouse at the forks of the Ohio River. The French then completed the blockhouse and expanded the fortifications, which they renamed Fort Duquesne, using it as a base to stop English incursions into the Ohio Country.

On suspicion that British provincial forces were operating west of the Alleghenies, the commander of Fort Duquesne, Claude-Pierre Pécaudy de Contrecoeur, sent Ensign Joseph Coulon de Villiers de Jumonville and a scouting party of 35 men to discover the whereabouts of the English. The English forces in question were some 150 Virginia militiamen and a handful of native allies operating under Lieutenant Colonel George Washington, whom Virginia's Lt. Gov. Robert Dinwiddie had ordered to secure the Forks of the Ohio. Dividing his force into smaller scouting parties, Washington and approximately 47 men caught up with Jumonville in the Allegheny foothills on May 28, 1754.

Earlier that morning, Washington had called a council of war that included Tanaghrisson (Half-King), whose scouts had led the British to Jumonville's camp. While the Virginians took up positions around the encampment, Washington's native allies moved to the French rear. The French, meanwhile, prepared their breakfasts, probably unaware of the danger lurking around them.

It is impossible from known records to determine who fired first, or how the skirmish developed. Within 10 or 15 minutes, however, a single Virginian was dead and 2 were wounded. And the French had suffered 12 to 14 casualties. A cease-fire was quickly called, and the Virginians prepared to allow the wounded Jumonville to read his orders.

The ensign had little time to explain his summons—still less to discuss it—before Tanaghrisson attacked him. Half-King said to Jumonville, "You are not yet dead, my father," a reference to the French practice of paternalistic benevolence toward their American Indian allies, before splitting open the latter's head with a hatchet and washing his hands in the dead man's brain, an old Iroquois custom. Washington's other native allies soon followed suit, killing other French soldiers until only a single injured Frenchman remained alive. The 20 other unwounded Canadians remained untouched and soon became Washington's prisoners. Commentators for both sides have argued whether the action at Jumonville's

Glen was a skirmish or a massacre, and whether the ensign's death was an assassination by Washington's order or an unfortunate oversight by a novice officer.

After the incident, Washington consolidated his forces, withdrew about 10 miles, and began to construct the aptly named Fort Necessity. Meanwhile, an expedition of revenge set out from Fort Duquesne under Jumonville's brother, Captain Louis Coulon de Villiers. This force of 600 Canadians and 100 native allies caught up with Washington and his 500 colonial militiamen on July 3, 1754, and forced their surrender. After thus encounter, both sides began mobilizing for a large-scale conflict that became the French and Indian War.

Just War Theory

A term that deals with the justifications for waging war and how just wars are carried out. The justification for war (*jus ad bellum*) and conduct in war (*jus in bello*) are governed by a set of ethical, religious, philosophical, and legal guidelines that were developed from the general theological contributions of St. Augustine (354–430) and St. Thomas Aquinas (1225?–1274).

The first philosopher to delineate the principles that should determine when it is proper to engage in warfare, Augustine argued that the primary justification for war was to preserve a nation from serious harm. In his view, avenging a serious wrong was a legitimate reason for war as well. Securing political or economic gain, however, was not justification for war. Augustine also asserted that in order to be just a war had to be declared by proper governmental authority and its scope should be limited to the minimum necessary to secure order and to reestablish peace. In his 13th-century *Summa Theologica*, Aquinas restated three conditions that justified war: competent authority (a sovereign government), just cause (avenging aggression), and right intention (impartiality over self-interest).

The general rules for just war set by Aquinas were retained by many theorists and jurists, who added their own conditions for a just war, particularly during the period between the 16th and 18th centuries. The model laid out by Francisco de Vitoria (1492–1546) and Francisco Suarez (1548–1617) examined the question of how to wage war either defensively or offensively. To justify a defensive war, a peaceful society had to suffer an aggressive attack. And for an offensive attack to be justified, it had to be a response to a significantly damaging action. Both defensive and offensive warfare, however, had to be fought not only as a last resort but also in a proper manner.

Where Vitoria and Suarez attempted to answer the question on how to wage war while maintaining Christian values, other theorists approached the topic of just war from a secular perspective. Hugo Grotius (1583–1645), for example, noted that war was just if a nation faced immediate danger, if a nation's interests were defended with necessary force, and if the force used was commensurate with the danger. Grotius may have had the biggest impact on warfare and just war theory during the North American colonial period.

K

Karankawas

Name for a number of Native American tribes—probably five or more loosely related bands—that lived on the Texas coast until they became extinct about 1850. The specific area they inhabited was the coastline roughly between western Galveston Bay and just north of Corpus Christi. At their most numerous, the Karankawas probably never exceeded 10,000 in number.

The Texas coast is a flat, low-lying region protected by a string of barrier islands. Numerous rivers flow into its bays of Galveston, Matagorda, Aransas, and Corpus Christi. The natives who settled along these rivers from Galveston to Corpus Christi, comprised the groups of the Karankawas. They were the Charrucos, the Hans, the Deguenes, the Carancaquacas (Karankawas), the Guaycones, the Quitoles, the Camolas, and possibly the so-called Fig People. The Karankawas spoke an unusual language that may have been originally related to Caribi.

The Karankawas were nonsedentary hunter-gathers who also planted small gardens. Living in wigwamlike structures, they moved from place to place in large dugout canoes to search for food. They engaged in ritualistic ceremonies (*mitotes*) during which they drank an intoxicant brewed from the yaupon plant. Their worship was centered on the sun, to which they gave homage when it disappeared at sunset.

The Karankawas were not well organized politically. Leadership was not inherited but earned by merit, often through battle. The Karankawas employed the long bow for both hunting and battle. They acquired a reputation for cannibalism, probably from the ritualistic or magical practice of eating the flesh of a dead enemy.

The first European encounter with the Karankawas came in 1532, when survivors of a Spanish expedition into the panhandle of Florida and originally led by Pánfilo de Narváez were cast ashore.

Álvar Núñez Cabeza de Vaca, a member of the expedition, lived among the Karankawas for six years as a captive. He eventually returned to Spanish territory, and his report became the most extensive information available on the Karankawas.

After the Spaniards, the French were the next Europeans to encounter the Karankawas, specifically René-Robert Cavelier, Sieur de La Salle, who visited in 1685 and established Fort St. Louis along Garcitas Creek on the edge of Matagorda Bay. Relations between the French and the Karankawas quickly turned violent, and the natives killed the French settlers, ending this attempt at a permanent settlement.

In 1722, the Spanish established a presidio, Nuestra Señora de Loreto, and a mission on the ruins of the French fort. However, Spanish efforts to convert and pacify the Karankawas failed. In 1754, the mission of Nuestra Señora del Rosario was established at what soon became known as Goliad. Again, the Karankawas resisted efforts to convert them. Undeterred, the Spanish erected the mission Nuestra Señora del Refugio in 1791 near the mouth of the Mission River. It too experienced little success.

In 1817, the privateer Jean Laffite fought with the Karankawas, inflicting heavy losses on them. Stephen Austin, the Texas colony impresario, led a force against the Karankawas in 1825. By 1850 or so, disease, hostile actions by other tribes, and white encroachment resulted in the extermination of the Karankawas.

Kickapoos

Native American group first encountered by Europeans in the Green Bay (modern-day Wisconsin) and Fox River regions. The tribe belongs to the Algonquian linguistic group. The name means literally "he who moves about, standing now here, now there." This title is borne out by the movements of the Kickapoos, who changed geographic locations several times during the 17th and 18th centuries. Nevertheless, they exhibited a great deal of closely guarded cultural homogeneity. And although they were often forced into contacts with various Europeans, the Kickapoos consistently remained hostile and aloof.

The Kickapoos probably originated in the area of southeastern Michigan and northwestern Ohio. They were forced to relocate in modern-day Wisconsin as a result of their involvement in the Beaver Wars (1641–1701). It was during their residence in Wisconsin that the Kickapoos first appeared in French records. In the first decades of the 18th century, they moved into what is now central Illinois, near present-day Peoria. Between 1729 and 1749, the Kickapoos split into two distinct groups. The tribe separated in an effort to make itself less vulnerable to a single, large-scale enemy attack.

Culturally, the Kickapoos were conservative and repeatedly shunned any efforts to assimilate into European culture. Such was the case even after trade with the French made it almost imperative for their survival. Part of their conservatism stemmed from their small size, as they never exceeded 3,000 in number. The Kickapoos' social organization was clan-centered and patrilineal, with descent traced through the father. Brothers and sisters of the mother did, however, play significant roles in raising the children.

Although the Kickapoos vigorously resisted interactions with Europeans, they often formed alliances with other Native American tribes. In 1685, for example, the Kickapoos formed a confederacy with the Fox and several other tribes. The purpose of the alliance was to resist incursions by the Sioux. Indeed, the Kickapoos remained important allies of the Fox during the Fox War.

Later, the Kickapoos switched allegiances, becoming a French ally and turning against the Fox. They continued in their alliance with the French, eventually fighting against the English in the French and Indian War (1754–1763). Members of the Vermillion Kickapoos took part in the siege of Fort William Henry in 1757. As a result of these activities, they were infected with smallpox, which they brought back to their villages that winter.

Almost immediately following the French defeat in the conflict, the Kickapoos took part in Pontiac's Rebellion in 1763 and remained hostile toward the British longer than many other tribes in the Midwest. When Kickapoo resistance to British domination finally relented, in came not by way of military force, but rather because of the efforts of the frontier diplomat and trader George Croghan, whom the Kickapoos had captured in a raid.

Kieft, Willem

Born: ca. 1600 Died: 1647

Director general of New Netherland (the Dutch West India Company) from 1638 to 1646. Willem Kieft was born around 1600 in the Netherlands. Little is known of his early years, although he had apparently suffered serious financial problems that had bankrupted him before he left Europe for New Amsterdam. The Dutch West India Company had apparently learned little following the

Willem Kieft was a highly unpopular leader of New Netherland, holding the position of director general during 1638–1646. (Library of Congress)

failures of the previous director general, Wouter von Twiller. Kieft arrived in New Amsterdam in March 1638 and was not pleased with the settlement he found there. Indeed, he complained of the crumbling fort and shoddy houses that surrounded it. Kieft subsequently oversaw repairs to the fort, and the construction of the Stadt Huys (City Hall) in 1642, which was a place where visitors could be entertained. He also ordered the construction of a church within the already cramped Fort Amsterdam, against the wishes of the people.

Kieft encouraged English settlers who were being persecuted in New England for religious reasons to settle in New Netherland. English settlers became so numerous in New Amsterdam that an official translator had to be employed. Nevertheless, Kieft was wary of English encroachment on Dutch territory, and watched with consternation as English settlements grew in Connecticut, just to the east. He also tried to dissuade former New Netherland governor Peter Minuit from establishing a settlement in 1638 for the Swedish on the Delaware River (near present-day Wilmington, Delaware).

Although Kieft had officially prohibited the sale of guns or gunpowder to Native Americans, the Dutch settlers could not resist the opportunity to make money by such ventures. They were indeed quite pleased to receive 20 beaver skins for a single firearm. Hoping for more money for his coffers, Kieft hatched a scheme to charge local natives a tax for protection by Dutch soldiers. When the natives balked, Kieft retaliated against the Raritan tribe for an incident involving a hog theft. As tensions ran high, the murder of a Dutchman by a Wickquasgeck warrior precipitated a full-scale war.

In February 1643, Kieft ordered the massacre of two groups of nonhostile Wickquasgeck Native Americans who had camped near New Amsterdam seeking shelter from the Mohawks. The conflict this action initiated became known as Kieft's War, and cost many lives and the destruction of much property. Kieft's growing unpopularity was a direct result of the war and of his stubborn rejection of any compromise. In 1647, Kieft was called on to return to Holland and account for his actions, including his policy toward the Native Americans. His ship sailed from New Amsterdam on August 17, 1647. Off the coast of England, a storm sent the vessel onto a rocky shoal, and most of the passengers, including Kieft, perished. Petrus Stuyvesant replaced Kieft as director general.

Kieft's War

Start Date: 1639

End Date: August 1645

Conflict largely conducted in the vicinity of New Amsterdam and precipitated by a massacre of Native Americans under orders of Dutch governor Willem Kieft. Kieft's War is also known as Governor Kieft's War and Willem Kieft's War. Since the founding of New Amsterdam in 1624, relations with local Native Americans had been mostly peaceful. That changed, however, when Kieft became director general (governor) of New Netherland in 1638. Kieft first provoked the Raritan tribe, allegedly in retaliation for their theft of pigs on Staten Island. In response, the Raritans burned a Dutch farmhouse and killed four Dutch settlers.

In the summer of 1641, a Wickquasgeck tribesman showed up at the door of a wheelwright named Claes Smit, who lived a few miles north of New Amsterdam. The native pretended to be interested in buying cloth, but then killed Smit in revenge for the murder of his uncle in 1625. Kieft demanded that the Wickquasgecks produce the killer at once and hand him over to Dutch officials. They refused to comply.

In August 1641, Kieft assembled the citizens of the town to appoint an advisory council of 12 men to deal with the brewing Native American crisis. The questions facing the committee were fourfold: should the Dutch seek revenge for the murderer of Claes Smit; should the natives' whole village be destroyed in the process; how and when should retaliation be exacted; and who should conduct such an endeavor? Kieft's hope was that the council would simply draft similar plans for war that he himself had already been plotting. To his dismay, however, the council was not so eager to engage in warfare.

The council's response to Kieft's questions was a diplomatic one. It did agree that force should be used if necessary, but its petition recommended a careful course of action. The council also seemed to understand the position Kieft was trying to put them in, and so its members cleverly replied that since he was director general, he must lead the way in any plan of attack. The councilmen did favor continuing to advise Kieft, however. Angry at the council's response, Kieft issued a decree thanking its members for their help, but forbidding the 12 councilmen from meeting again.

On February 25, 1643, Kieft ordered Dutch soldiers to attack two groups of unsuspecting Wickquasgecks at Corlaer's Hook (Manhattan) and Pavonia (New Jersey). The natives had encamped at those spots from points north, seeking refuge from Mohawks, their adversaries. That evening, the former leader of the advisory council, David de Vries, tried in vain to convince Kieft of the folly of his plan, even as the soldiers prepared for attack. The raid went ahead, and more than 100 natives were massacred while they slept. Although Kieft's order specified that women and children be spared, such was not the case.

Illustration showing Dutch envoys treating with Native Americans at Fort Amsterdam in New Netherland. (Library of Congress)

In his journal, De Vries recorded the vicious brutality directed against the natives, reporting that he could hear the screams of victims at Pavonia. He wrote that the Native Americans were "massacred in a manner to move the heart of a stone." The colonists were not happy that Kieft had gone against their wishes. Indeed, they knew that a state of war with the natives would seriously affect the fur trade, as they did not trap animals themselves but relied on Native Americans as their main source for furs.

Safety was also a major concern for the Dutch colonists. Despite orders to the contrary, Dutch settlers had continued to trade and sell guns and gunpowder to various native tribes. As the conflict expanded beyond the Wickquasgeck tribe that Kieft had ordered attacked, the colonists realized that their forces were badly outnumbered by Native American warriors, by about 1,500 to 200. Native warriors killed colonists all over New Netherland, also destroying their homes, crops, and livestock. Safety could only be found within and around the walls of the crumbling Fort Amsterdam, whereas the farms in outlying areas to the north were constant targets of nighttime strikes by natives. An appeal for help to the English settlement at New Haven was rebuffed.

Natives murdered the recently arrived Anne Hutchinson (a refugee from Massachusetts) and six of her children on isolated

land in the Bronx that Kieft had given her. The settlement at Mespat (in present-day Queens) was wiped out during Kieft's War, and the village's founder, Rev. Francis Doughty, fled to New Amsterdam. A settlement across the North (Hudson) River in present-day New Jersey was decimated. Gravesend in present-day Brooklyn was attacked but not destroyed.

The fighting continued into 1644. As the war became more expensive and destructive, it nearly bankrupted the colony. Kieft proposed levying taxes on beaver skins and beer, to the outrage of citizens.

The tide turned in 1644, when the Dutch hired English mercenaries led by Captain John Underhill. Combining his forces with newly arrived Dutch forces, he raided a Native American settlement in Connecticut at night, killing hundreds. Hundreds more were killed soon after in another raid north of Manhattan Island. Beginning in April 1644, Underhill led skirmishes on Long Island, and his men killed more than 100 natives at Massapequa.

Finally, by the summer of 1645, both sides were ready to end the bloodshed, and a peace treaty was negotiated in August 1645. Kieft and the representatives of several native tribes held a ceremony in front of Fort Amsterdam to mark the end of hostilities. The terms of the peace treaty stated that the Dutch would stay away from

Native American settlements and that armed natives were not allowed to approach Dutch settlements.

The fallout from the war was significant. Most of the farms in Manhattan had been damaged or destroyed during the war, leaving only a scant few unharmed. In the colonists' minds, the war erased any good that Kieft may have done while governor. Indeed, a petition of grievances against Kieft was smuggled to Holland in the fall of 1644, which ultimately resulted in his ouster in 1647.

King George's War, Land Campaigns

Start Date: January 25, 1744 End Date: October 1748

One in the series of imperial wars of the 18th century involving Great Britain and France that spilled over from Europe to North America. In December 1740, taking advantage of the accession of young Austrian archduchess Maria Theresa to the Austrian throne, King Frederick II of Prussia initiated the First Silesian War, sending Prussian troops into Silesia and seizing that rich Austrian province. The major European powers took sides and the conflict grew into what was later known as the War of the Austrian Succession (1740-1748). In the war, France sided with Prussia whereas Britain supported Austria. This situation was complicated by the Anglo-Spanish War, popularly known as the War of Jenkins' Ear, between Britain and Spain. This war, which had begun in 1739, led to some clashes along the North Carolina, Georgia, and Florida coasts involving Spanish and British forces. In consequence of the signing of the Second Family compact between France and Spain (October 23, 1743), France declared war on Britain on March 4, 1744, and King George II issued a counterdeclaration of war on March 29.

News of the declarations of war reached North America by the end of April. Perhaps wishing to steal a march on the English, the French began hostilities in North America, although neither side prosecuted the fighting there with great vigor. In May, the French launched an attack from their great Cape Breton Island fortress of

Louisbourg against Canso (Canseau), a small English fishing settlement in extreme northeastern Nova Scotia. The French took Canso without difficulty on May 13. The attack turned out to be a mistake in the sense that it fully alarmed New England.

A few weeks after the French took Canso, a French-allied Native American force also appeared before Annapolis Royal (formerly Port Royal), Nova Scotia. The natives showed little inclination to attack a fortified position, even one defended by only about a hundred men, and they soon withdrew on the arrival of 70 Massachusetts reinforcements. In August, native warriors returned, this time with some French troops, but Massachusetts reinforcements again caused the attackers to depart.

Meanwhile, Gov. William Shirley of Massachusetts was preparing an expedition against Louisbourg. Public sentiment in Massachusetts strongly supported the plan. Massachusetts citizens were anxious to eliminate this key French base, hopefully thereby ending French support for Native American attacks along the northern frontier. Also, Louisbourg was in times of peace the chief base for French fishing vessels, which were in direct competition with those of New England for the rich fishing grounds of the Grand Banks. In war, the harbor at Louisbourg served as the principal base for French privateers preying on New England merchant vessels plying the most traveled sea route to and from New England as well as attacks on the English colonists' fishing boats. The attack on Canso also fueled New England fears that the French desired to take back Nova Scotia, formerly Acadia, where several thousand Frenchspeaking inhabitants still lived. The religious fervor of the Great Awakening was still prevalent, and strong anti-Catholic sentiment in New England also played a role in the desire for offensive action.

In late 1744, a number of exchanged British prisoners arrived back in Boston from Louisbourg. Among them was Lieutenant John Bradstreet, taken prisoner at Canso. He and the other prisoners had taken advantage of their stay in the French fortress to familiarize themselves with its defenses. Bradstreet was convinced that Louisbourg was then vulnerable to attack. He pointed out that its defenses were incomplete and that its garrison was disaffected. Meanwhile, another of the former captives, merchant ship captain William Vaughan, who had a strong financial interest in the outcome, did what he could to whip up enthusiasm in Boston for a descent on Louisbourg. Prominent business, shipping, and fishing interests all backed the idea. With Governor Shirley strongly in favor, on January 25 the Massachusetts General Court voted, by the narrowest of margins, to undertake operations against Louisbourg, if the rest of New England would render assistance.

Shirley now notified London, where such a plan had already been discussed, and hastened to secure support from the other colonies, including all of New England, New York, New Jersey, and Pennsylvania. Most New Englanders supported the idea, although Rhode Island at first declined to send any troops. Beyond New England, however, the response was less than satisfactory. Also discouraging was the reply from Commodore Peter Warren, senior British naval officer in the Caribbean, whose ships would be the

ones to provide any Royal Navy support. Although he was personally sympathetic to the plan, Warren informed Shirley that his participation would require orders from London.

Despite these obstacles, Shirley proceeded. To command the expeditionary force, Shirley selected William Pepperell Jr., a merchant living in Kittery and commander of the Maine Militia (Maine was then part of Massachusetts). During February and March 1745, colonial volunteers assembled at the New England ports, especially Boston. Supplies were also collected to be transported to Louisbourg in a polyglot colonial fleet.

Finally, on March 24 the colonial fleet of 51 transports lifting 2,800 Massachusetts troops departed Nastasket Road escorted by the colonial warship *Shirley*. New Hampshire sent 450 men and Connecticut volunteered 500, raising the troop strength to somewhere around 3,500 men. Only after this force sailed did Shirley receive word from Commodore Warren that he had received authorization to participate and was headed north with a squadron of warships.

The Massachusetts contingent arrived at the rendezvous point off Canso on April 4 and there linked up with the New Hampshire volunteers, already present. On April 22, a British warship arrived with the welcome news of Warren's participation, and the remaining British warships hove into sight the next morning. A few days later the Connecticut contingent at last arrived.

The expedition, now numbering about 100 vessels of all types, departed Canso for Louisbourg on April 29. The next day the motley fleet arrived off Gabarus Bay, some four miles southwest of Louisbourg. French commander and acting governor of Louisbourg Louis du Chambon had not expected the attack to come from that direction. The New England troops soon went ashore and landed their supplies and the few artillery pieces they had brought with them while Warren's ships kept up a blockade of the French fortress from the sea side.

The keys to the defense of Louisbourg were the Island Battery and Grand Battery. Bradstreet, now serving in Pepperell's forces, insisted that the Grand Battery was in poor repair and could be taken immediately. The French defenders reached the same conclusion and obliged the attackers by abandoning it. On only their third day ashore, colonial troops occupied the Grand Battery and secured its 30 cannon, which the French had failed to remove. Although the French had spiked the guns, they had not done a thorough job and boring out the touch holes again so they could be fired was not an insurmountable problem. By noon on May 3, the colonials had turned one of the guns against the French fortress, and other guns were soon returned to service and joined in. Thanks entirely to the French, Pepperell had secured the cannon he needed.

Warren, meanwhile, envisioned a joint assault on the fortress by colonial troops on land and the Royal Navy ships forcing their way into the harbor. Before that could go forward, however, the French Island Battery had to be taken. Its garrison repulsed one amphibious assault with heavy losses for the attackers on the night of May 23. Finally by June 10, the colonials succeeded in placing cannon on Lighthouse Point at the north end of the harbor entrance, and from

this point were able to shell the Island Battery, rendering it untenable. At the same time the colonials continued to fire into Louisbourg itself, forcing its inhabitants to take refuge in the fortified casemates.

During the second week in June, additional Royal Navy ships arrived, bringing Warren's squadron up to 11 vessels. Louisbourg was now completely cut off. On June 17, with Louisbourg having been buffeted by some 9,000 cannonballs and 600 explosive shells, his supply of powder running low, no prospects of relief, and morale low among the garrison and civilian population, Chambon surrendered. Warren then took possession of the town. Although the Royal Navy had made possible the capture of Louisbourg through its effective blockade, Pepperell and the colonials justly received the credit for the victory, heralded as a remarkable achievement for a militia force.

The colonial success at Louisbourg provided an unmistakable psychological boost to the New Englanders. It was certainly the greatest accomplishment of colonial arms before the American Revolutionary War. Many colonials falsely took it to mean that militia forces were superior to regular forces. A colonial force remained in garrison at Louisbourg, but dysentery, smallpox, and yellow fever claimed a high toll of the occupiers.

Governor Shirley, meanwhile, urged an immediate assault on Quebec in order to seize all of Canada. London approved the plan and even ordered the other colonial governors to cooperate. The British government also promised to pay for the troops raised, and pledged to contribute a fleet and eight battalions of regulars to meet the colonial force in Louisbourg. All the New England colonies, plus New York, Maryland, and Virginia, supplied troops. Mohawk warriors agreed to join as well. The colonial militia was in place by July 1746.

Unfortunately for the English colonists, the result was a repeat of 1709 as the English troops and ships were never sent. European considerations led to their diversion there. The assault on Canada was called off and the colonial troops dispersed.

Fortunately for the English colonists, the French were not able to take advantage of London's quiescence. Recognizing the importance of Louisbourg to New France, the French mounted a considerable effort under Admiral Jean-Baptiste-Louis-Frédéric de la Rouchfoucauld de Roye, Duc d'Anville. The assembled force included 76 ships lifting 3,000 men with the goal of retaking Louisbourg and Annapolis Royal. The ships had a difficult three-month passage to America, during which they were buffeted by hurricanes, and the men in the crowded ships fell prey to an outbreak of smallpox. On the fleet's arrival in American waters, d'Anville died of apoplexy. His successor attempted suicide and was in turn succeeded by the Marquis de la Jonquière, governor designate of New France. Before the fleet limped back to France, the infected troops inadvertently spread smallpox ashore among the Native Americans. The disease would exact a higher human toll on France's allies than the latter sustained in fighting during the entire war.

New Englanders had dared to believe that the capture of Louisbourg would bring an end to native attacks along the northern frontier, but this did not prove to be the case. Indeed, after the fall of Louisbourg, native attacks in Maine, New Hampshire, and Massachusetts actually increased. Early in 1744, the Massachusetts General Court ordered construction of four new posts along the Connecticut River. These became Fort Shirley, Fort Pelham, Fort Massachusetts, and Fort at Number Four. Massachusetts also sent 440 militiamen to guard the northwestern frontier. These efforts came none too soon, for in July 1745, natives attacked the Great Meadow Fort in modern-day Putney, Vermont, and St. George's Fort in today's Thomaston, Maine.

In this activity the Six Nations of the Iroquois Confederation occupied an important position because of their geographical location and influence. Ever since King William's War (1689–1697), the Iroquois had generally pursued a policy of neutrality. Throughout the war, the Iroquois position shifted based on self-interest. Clearly they did not trust the English. Fearful they would be left in the lurch, during the war the Iroquois tilted somewhat toward the French.

A number of the raids against the English originated from the French-built Fort St. Frédéric at Crown Point near the south end of Lake Champlain. Established in 1731, it served as a major post for attacks against English settlements in upper New York and New England. In November 1745, Lieutenant Paul Marin led a sizable raid of French forces from Fort St. Frédéric. His force consisted of some 520 Frenchmen, Iroquois, Nipissings, Hurons, and Abenakis, and even a priest.

Marin's objective was the English agricultural community of Saratoga, New York. Located on the west bank of the Hudson River some 30 miles above Albany, Saratoga boasted a fort but it was both poorly maintained and lacked a regular garrison. The raiders struck at night and achieved total surprise, setting fire to the fort, homes, farms, and mills. The raiders then withdrew, taking with them 109 prisoners as well as significant stocks of supplies. They arrived back at Crown Point on November 22. The Saratoga raid had a devastating effect on morale in the English settlements of the upper Hudson River Valley. Most settlers simply abandoned their homes and fled south. There were even fears that Albany might be attacked next.

During the spring of 1746, English settlements between the Kennebec River and Penobscot River in Maine came under native attack. In April 1746, natives struck at the Fort at Number Four on the Connecticut River located at present-day Charlestown, New Hampshire, but were driven back. The natives struck there again, twice in May and again in June. Attacks occurred all along the New York frontier. In August, a strong 700-man French and native raid occurred against Fort Massachusetts on the upper Hoosick River only 25 miles east of Albany. There were only 29 people at the post, of whom 21 were men, but they held out until their ammunition supply ran low. The attackers took them all prisoner then burned the fort. The colonial governments found it impossible to protect the thinly spread frontier population against such attacks. Those settlers who chose to remain did so at a high degree of risk. They might be killed in the fields or taken prisoner, their possessions seized or destroyed.

The situation for the English in Nova Scotia seemed particularly precarious. French forces were located nearby at Beaubassin on Chignecto Bay, and the Acadian population of Nova Scotia sought to maintain a neutral stance. At the Acadian village of Grand Pré, English colonel Arthur Noble commanded a 500-man garrison.

In early January 1747, Antoine Coulon de Villiers led a force of 200 Canadians from Beaubassin. The ground was covered with snow and the attackers had to resort to snowshoes and sledges. Gathering native and Acadian recruits as they proceeded, this French-native force arrived at Grand Pré at the end of the month. With a snowstorm arriving, Noble's men were caught unawares. Noble and several other officers were killed in the initial assault. After a fight lasting several hours and with 80 English dead and an equal number wounded, both sides agreed to terms by which the British soldiers were allowed to withdraw to Annapolis Royal. The French did not control northern Nova Scotia for long. Soon they too departed, and Grand Pré was reoccupied by a strong Massachusetts force.

In April 1747, Ensign Boucher de Niverville led a French force of perhaps 700 men against English forts along the Connecticut River. They attacked the Fort at Number Four, but after a three-day siege they gave up and departed. At London's request, English colonial leaders gathered a large force of more than 3,000 colonial militiamen and Iroquois at Albany in the spring of 1747. But with pay late in arriving from England and with unrest growing between various colonial factions, the troops were dismissed in July 1747.

The French attacked Saratoga again in late June 1747 with a mixed force of 500–600 men. In the attack the English suffered 15 casualties. Forty-nine men were also captured, before English reinforcements arrived from Albany. However, the New Yorkers decided that the fort at Saratoga was too costly to maintain and too vulnerable to attack. They burned the fort and abandoned the site.

Fighting along the frontier continued into 1748, with attacks by the English near Crown Point and near the Fort at Number Four. The French struck twice near Fort Dummer and another time near Schenectady, New York. British efforts to mollify their Native American allies continued as colonial leaders held a third Iroquois congress at Albany in July 1748. There the Iroquois declared themselves ready to fight but they also expressed disappointment with the failure to attack Quebec in 1747. In the meantime, other Native American tribes' relations with the English colonists grew even more strained.

Both sides engaged in considerable privateering activity during the war. Mostly this consisted of seizures of merchant vessels, but occasionally there were hit-and-run attacks on coastal settlements. A Rhode Island privateer attacked and sacked a Spanish town in north Cuba, and the Spanish raided coastal settlements in South Carolina and Georgia. In 1747, the Spanish even raided Beaufort, near Cape Lookout in North Carolina. The next year the Spanish attacked and held for a time the town of Brunswick, on the lower Cape Fear River. In 1747, French and Spanish privateers were active farther north, even penetrating some 60 miles up the Delaware River.

At the same time, however, the Royal Navy was actively reducing the French and Spanish fleets in European waters. The growing strength of the Royal Navy vis-à-vis its opponents boded ill for the French and Spanish in America, for it meant that reinforcements of men and supplies could not get through and that the British colonies'

far larger population advantage would come into play. Indeed, shortages of goods forced the French into illicit trade with the enemy English colonists. This impacted relations with the Native Americans as well; they now often turned to the better-supplied English colonists to procure needed goods. Certainly the scarcity of trade goods contributed to the revolt of the Miami tribe in the Ohio Country in 1747 and helped strengthen the pro-British faction among the Choctaws.

The long war ended with the October 1748 Treaty of Aix-la-Chapelle. As far as America was concerned, the key provision was the restoration of colonial conquests. In December news reached New England, where it was regarded as a great betrayal and a revelation of the disadvantage of being part of a worldwide empire. The colonists were incensed that Britain had returned Louisbourg whereas the French had handed back Madras in India, which they had captured from the English. The colonists held as insufficient Parliament's reimbursement to New England of £235,000, most of which correctly went to Massachusetts, and a knighthood for Pepperell. The war claimed some 500 English colonists dead in the actual fighting. More than 1,100 others died from disease and exposure. About 350 Frenchmen died in the fighting, with at least 2,500 dead from disease. Native American casualties were unknown.

The war left both the French and English empires in North America intact. Some dared to hope the peace would last, but wiser heads predicted a return to fighting and final showdown over which side would dominate North America. Indeed, the war resumed in 1754—this time the fighting broke out first in America—and ended in 1763 in a resounding French defeat. Louisbourg itself was retaken in 1758.

King George's War, Naval Campaigns

Start Date: March 1744 End Date: October 1748

King George's War (1744–1748) was the third in a series of major Anglo-French conflicts in North America. It grew out of the wider European War of the Austrian Succession (1740–1748), which began when King Frederick II sent the Prussian Army into Silesia

in an effort to seize that rich province from Austrian archduchess Maria Theresa. The war expanded and Prussia eventually secured the support of France, Spain, Bavaria, and Saxony. Maria Theresa was able to count on Britain, largely in the form of financial subsidies. The British government sought to prevent the expansion of Bourbon French and Spanish power in Europe.

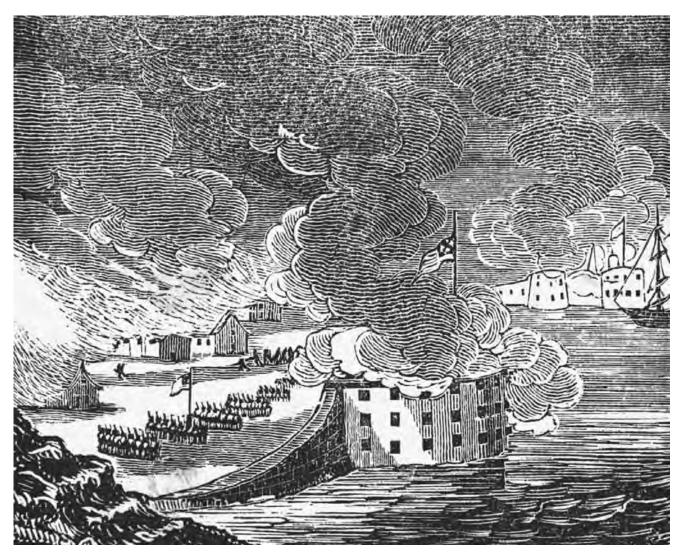

The War of the Austrian Succession overlapped with a conflict on the seas that had begun in 1739 between England and Spain (the Anglo-Spanish War or War of Jenkins' Ear, 1739–1743), a series of indecisive naval encounters. Fighting on the seas intensified considerably when, in March 1744, France declared war against Great Britain. The war at sea was fought in three chief theaters: North America and the Caribbean, India, and Europe.

The major operation in the North American theater occurred in June 1745 when a largely colonial force supported by the British Navy landed on Cape Breton Island with the plan to capture the French fortress of Louisbourg. The attackers settled into a siege and Louisbourg capitulated on June 27, 1745. London and the British New England colonies saw this operation as the springboard for the invasion and conquest of Canada, but that never occurred as British troops were required elsewhere.

The French did not want to let the matter rest there, for Louisbourg guarded the entrance to the St. Lawrence River, the lifeline to New France. With the plan of retaking the fortress, the French assembled a considerable force of 11 ships of the line and 50-gun ships, 3 frigates, 3 fireships, and 2 bomb vessels, along with a large number of transports and supply ships, all lifting 3,500 men. Admiral Jean-Baptiste-Louis-Frédéric de la Rouchfoucauld de Roye, Duc d'Anville, had command. The ships sailed from Brest on June 22. They had a long and difficult voyage to America, during which they encountered strong storms and the crews and troops aboard were decimated by an outbreak of smallpox. The French ships arrived off Nova Scotia on September 10. D'Anville died of apoplexy, and his successor committed suicide. Some supply ships were sent on to Quebec, but no effort was made to attack Louisbourg, and the remainder of the ships soon sailed back to France. On the return voyage, English ships took several of the French vessels.

In the Caribbean, there was much sparring, with the British attempting to take the Spanish treasure fleet. On October 1, 1748, at the very end of the war, the Royal Navy bested the Spanish in an encounter off Havana, Cuba.

The same sort of scenario unfolded in Indian waters. Here the object was the English port of Madras. On June 25, 1746, an indecisive skirmish occurred off Negapatam between a British squadron under Commodore Edward Peyton and the French under Admiral Bernard Mahé de La Bourdannais. Although no ships were lost on either side, La Bourdonnais succeeded in bluffing his opponent as to his strength and was able to reinforce Pondicherry and then invest Madras without British interference. In November 1747 the British sent six ships of the line against Madras but failed to recapture it. Most of the war here and in other theaters was in fact against the trade of the other, a *guerre de course* (war against commerce).

Surrender of the Royal Battery at Louisbourg on Cape Breton Island, 1745. A 19th century wood engraving. (The Granger Collection)

In Indian waters, the British succeeded in capturing or destroying much of the French East India Company's merchant fleet.

In the European theater of war, the British maintained a strong fleet in the English Channel in order to prevent any French invasion. The British also instituted blockades of major French ports, especially Toulon on the Mediterranean, which the Spanish used as a major supply base to support land operations in Italy. During February 11–13, 1744, a combined Spanish and French fleet tried without success to break the blockade there.

By 1745, the war had largely devolved into one against trade. On May 3, 1747, in the First Battle of Cape Finisterre, a British squadron of 17 ships under Admiral George Anson attacked and defeated a French force of 14 smaller warships and 24 merchantmen. The English captured 18 of the French ships. A similar result occurred on October 14, 1747, in the Second Battle of Cape Finisterre, when Admiral Sir Edward Hawke led 14 ships against 8 French warships under Admiral Desherbiers de Letanduère protecting a convoy. The

French fought doggedly to allow the convoy time to escape, but the engagement ended with the British capturing 6 of the French ships.

In terms of the war against trade, the British captured 1,249 Spanish ships and 2,185 French, for a total of 3,434 ships. The French took 1,878 British ships and the Spaniards another 1,360, for a total of 3,238 ships. This gave the British a slight edge in ships taken, of 196, but the advantage was probably more glaring for two reasons: the Spanish prizes were generally very valuable and the British merchant marine was much larger than its rivals and hence better able to withstand the losses. The chief advantage to the British in the war, however, was the sharp reduction in the size of the French Navy that occurred, so that it as no longer a real threat to British naval supremacy. Nonetheless, the Treaty of Aix-la-Chapelle in October 1748 that ended King George's War (1744–1748) saw a status quo ante bellum as far as France and England were concerned. The French took back Louisbourg in exchange for Madras in India.

King Philip's War

Start Date: June 20, 1675 End Date: October 1676

Last and deadliest general war between Native Americans and English colonists in southern New England, named for Wampanoag sachem Metacom, known to the colonists as King Philip. Tensions between natives and English colonists in southern New England had been building for years, driven by such incendiary subjects as land rights and the subjugation of natives to colonial law. While the colonies continued to grow in numbers and seize more and more land, the natives, decimated by European diseases, diminished in number with each passing year. By 1660, the colonists of Massachusetts Bay, Connecticut, Plymouth, and Rhode Island greatly outnumbered the native tribes remaining in the area.

In the midst of this native decline, Metacom, the son of influential Chief Massasoit, took control of the Wampanoag people on his brother Alexander's death in 1662. Metacom was not nearly as patient with the colonists as his father had been. Taken into court several times for breaking colonial law, he had no great love for colonial authorities.

For several years, it had been rumored that Metacom was secretly plotting with nearby tribes to attack the colonists. In January 1675, Metacom's former translator, later turned informant to the colonial authorities in Plymouth, John Sassamon, was found murdered shortly after warning Plymouth officials of Metacom's plan. In early June, the Plymouth authorities accused, tried, and executed three Wampanoag warriors for the crime. In revenge, on June 20, 1675, Wampanoags attacked the town of Swansea in southwest Plymouth Colony. The conflict spread rapidly thereafter, becoming known to history as King Philip's War.

A number of tribes joined Metacom and the Wampanoags, specifically the Pocasset, Sakonnet, and Nipmuck peoples. But others, such as the powerful Narragansetts, remained neutral while still other tribes, especially many Christian groups, sided with the colonists. Traditional enmities between tribes trumped the natives' common complaints against the English.

In June 1675, militia forces of the United Colonies tried to blockade Metacom and his followers on Rhode Island's Mount Hope peninsula, hoping for a quick end to the fighting. However, Metacom and his followers escaped via boats and into nearby swamps. The colonial forces pursued him throughout July. They were compelled to pull back when their ill-equipped and undertrained militiamen lost a number of skirmishes in the swamps. Although the natives were used to making their way across the swampy land-scape of southern Rhode Island, the thick brush and marshy ground slowed the English and frustrated their efforts to bring the enemy into open battle. Instead, the colonists found themselves the victims of frequent ambushes and traps. By late July, Metacom and his main force headed north to Nipmuck country, where on July 14 the Nipmucks had attacked Mendon, the first, but not nearly the last, Massachusetts Bay town struck.

In the fall of 1675, the fighting shifted to the Connecticut River Valley. By then, Metacom's forces were attacking colonial towns the length and width of the valley. The United Colonies sent troops west to protect the towns, deciding on a strategy that called for defending all the towns. Major John Pynchon, the founder and majority landholder of Springfield, had charge of the western theater of operations.

The natives besieged Brookfield in August and quickly devastated Northfield and Deerfield. The militia companies did little better in the woods of western Massachusetts than they had in the swamps of Rhode Island. Natives ambushed Captain Richard Beers's 40-man company in September 1675. In one of the most infamous incidents of the war, Captain Thomas Lathrop and his company of 70 men from Essex County were ambushed while securing a wagon train of food from abandoned Deerfield. On September 19, Lathrop's men, many of whom had placed their muskets in carts to eat wild grapes along their route, were surprised by hundreds of warriors and ambushed alongside the banks of the Muddy Brook, now known as Bloody Brook. At least 60 colonists, including Lathrop, were slain.

The worst blow to the colonial cause came in October, when native forces attacked and destroyed much of the town of Springfield, the main settlement and military command center for the entire valley. Major Pynchon subsequently resigned his post as western commander to help in the rebuilding of Springfield, and Captain (later Major) Samuel Appleton took over. Appleton and his men soon shifted their attention away from the western theater.

In November 1675, the commissioners of the United Colonies, having evidence that the neutral Narragansett tribe was in fact aiding Metacom, decided on a preemptive strike against the Narragansett homeland. Massachusetts Bay, Plymouth, and Connecticut put an army of more than 1,000 men in the field against the Narra-

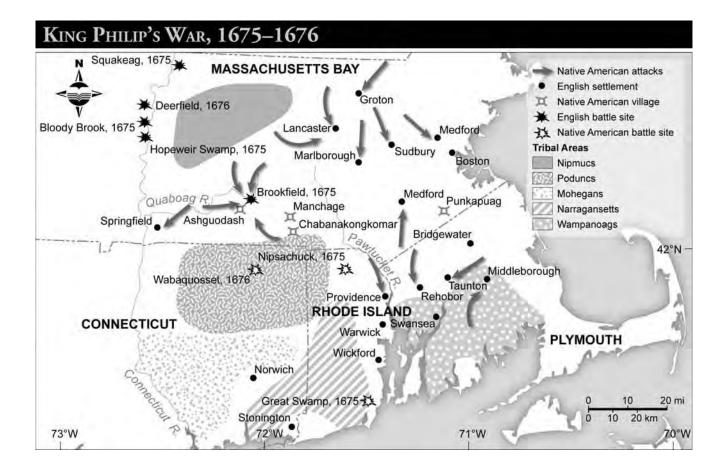

Depiction of fighting between American colonists and Wampanoag Native Americans in 1675 during King Philip's War. The war resulted primarily from continued colonial encroachments onto Native American lands. (Library of Congress)

gansetts, with Gov. Josiah Winslow of Plymouth in overall command. Charged with making the Narragansetts live up to their treaty obligations, the army soon abandoned this goal and decided simply to stage a preemptive attack on the strong Rhode Island tribe. The wintry conditions, although harsh, allowed the English to march over the now-frozen swamps, and the now-thin brush allowed them to see farther in the thick forests. In place by mid-December 1675, the army based itself at Wickford, Rhode Island, and fought a number of small skirmishes before attacking the Narragansetts' main fortified village in the middle of the Great Swamp.

With the help of a native traitor, the colonial army found and attacked the Narragansett fort on December 19, 1675. The fighting was at first indeterminate. Winslow's order to burn the village, however, with hundreds of people still inside shelters, turned the tide of the battle. Initial casualties were about 20 dead and 200 wounded on the colonial side. Estimates of native dead, largely from the fires, range from 600 to more than 1,000. Having destroyed the fort, the colonial force then limped back to its base in Wickford in the midst of a horrible winter storm in which many of the wounded died. The remainder of the colonial force, along with some fresh troops, tried to pursue the remainder of the escaping Narragansetts in the infamous Hungry March during January–February 1676. Although many considered the Great Swamp Fight

a great English victory, it did bring to Metacom a large number of committed Narragansett warriors bent on revenge.

Metacom had hoped to spend the winter months to the west, readying his men for the spring campaign. In order to do this, he needed the cooperation of the mighty Mohawk tribe. However, instead of welcoming their fellow natives, the Mohawks took the opportunity to lash out at a weakened rival. In February, 300 Mohawk warriors attacked a winter camp of 500 of Metacom's men east of Albany and routed them. Other such attacks occurred. Metacom was now fighting a two-front war, a development that had more to do with his ultimate demise than any other. In the spring, Metacom once again took to attacking colonial towns in the western Connecticut River Valley. The natives raided towns up and down the valley. Some, such as Sudbury in April 1676, were amazingly close to Boston (within 20 miles). Civilian inhabitants abandoned more than 12 towns as the frontier moved eastward. Yet the two-front fighting in which Metacom was now engaged, along with English superiority in numbers, changes in tactics and militia preparedness, and the increased use of native allies as scouts and guides all began to take their toll. The Fall's Fight of May 1676, when a large group of warriors was ambushed and many perished plunging to their deaths over a high waterfall, demonstrated this fact. In her famous captivity narrative, Mary Rowlandson of Lancaster

noted that her captors were tiring of the fight and their food and supplies were dwindling by the late spring of 1676.

By the summer of 1676, with almost no food (most of the native fields and food caches had been destroyed by colonial troops) many Native Americans gave up the fight and surrendered. In July 1676, forces under Captain Benjamin Church captured Metacom's wife and son, who, along with hundreds (if not thousands) of captured natives were sold into slavery in the West Indies. Metacom slipped back to the vicinity of his Mount Hope, Rhode Island, home with his most faithful followers.

On August 12, 1676, a native warrior under the command of Captain Church shot and killed Metacom. His head was taken to Plymouth town, where it was placed on a pike and displayed for a number of years, a grim warning to other natives who might think of resisting English authority. By October 1676, the other native leaders and their men had been captured and the war came to an end, except in Maine where intermittent violence continued for a number of years.

King Philip's War was the deadliest war in American history in terms of numbers of casualties for people involved. Colonial losses were between 800 and 1,000, with at least 12 towns totally destroyed, hundreds of houses and barns burned, and thousands of cattle killed. Native American losses were even more severe. Perhaps 3,000 warriors were killed in battle, with hundreds more men, women, and children killed or sold into slavery after the war. Nor did the native converts to Christianity escape unscathed. Fearing that they might

aid Metacom, colonial officials rounded up the native inhabitants of the "praying towns," and confined them on an island in Boston harbor, where may died of disease and exposure. The tribes of southern New England never recovered from King Philip's War. Indeed, their ability to resist the colonial onslaught had ended.

King William's War, Land Campaigns

Start Date: 1689 End Date: 1697

King William's War was the North American extension of what began in Europe as the War of the League of Augsburg. The European conflict grew out of Catholic-Protestant tensions, French king Louis XIV's expansionary policies in the Low Countries and the Rhineland, and the accession of the Protestant William of Orange (King William III) and his wife Mary to the English throne. This occurred after the overthrow of Catholic king James II in the 1688 Glorious Revolution. Nevertheless, James II still enjoyed powerful support among Catholics in England and Ireland as well as from the French king. Louis XIV's expansionist ambitions on the continent and his desire to restore a Catholic to the English throne fueled Anglo-French rivalry.

Full-scale war in Europe commenced in September 1688 when France invaded Flanders and the Palatinate. England and the Netherlands then united to support the League of Augsburg—an alliance of Protestant-German principalities—along with Austria, Spain, and Sweden against France.

Political and religious tensions in the New World mirrored those in the old. Catholic New France and the Protestant English colonies in New England and New York had been moving steadily toward confrontation. Rivalries surrounding fishing rights, the fur trade, and Native American violence on the northern frontier inflamed feelings on both sides. The resulting war produced a string of failures by the colonial forces of English America. That, combined with a series of horrific native raids on the northern frontier, triggered a panic in Massachusetts that influenced the Salem Witch Trials of 1692 and caused a general crisis of confidence between the English colonists and the government in London.

The ensuing war stimulated domestic industry (particularly shipbuilding) in the colonies and led them to find their own methods of financing military operations. Particularly significant was the Massachusetts Bay Colony's decision to print paper money to defray the cost of the 1691 naval expedition against Quebec.

Because of English military failures, relations with their closest Native American allies of the Iroquois Confederation suffered greatly. For the home country, King William's War revealed the dangers involved in relying on separate colonies to cooperate with each other. Nevertheless, the frustrating stalemate led many colonists to question London's commitment to their interests. In neither Europe nor North America did this nine-year conflict resolve any of the issues between England and France. Indeed, the 1697 Treaty of

Ryswick proved only a temporary truce before the onset of Queen Anne's War in 1701.

In North America, news of the 1688 English Revolution gave impetus to long-nourished desires in the colonies, particularly in New England and New York, to strike against French Canada. New England Puritans had chafed under James II's prohibition of attacks on the French and raged against encroachments by the latter on the fur trade and offshore fisheries and incitement of Native American violence.

For their part, the French regarded the English colonies as threats to New France. They harbored their own ambitions in the Mississippi River Valley and Ohio River Valley and northern Maine to the Kennebec River. French agents cultivated local tribes along the northern New England and New York frontiers, especially the Abenakis. In fact, the French had established a fort along the Penobscot River in Maine (then part of Massachusetts) to funnel arms to potential native allies. The governor of New France, Count Louis de Buade de Frontenac, an abrasive but skilled career soldier, actively strengthened ties with the pro-French tribes and encouraged them to attack the Iroquois and frontier settlements in northern Maine.

Indeed, war between the French and the Iroquois had already broken out in August 1689. That month, a large Iroquois war party fell on the French village of Lachine near Montreal, slaying or capturing most of the population. News from Europe ignited this tinderbox into full-scale war.

In the ensuing conflict, the English colonists set goals that were vastly different from those of their home country. In Europe, King William III's objectives were limited to protecting his throne and preventing French expansion into the Low Countries and to the banks of the Rhine. Protestant New England and New York, however, sought nothing less than the destruction of New France and the expulsion of the French from North America.

In neither the ground nor the naval dimensions of King William's War did events develop as English America had hoped. The English colonies began the war with three major advantages. First, they possessed a lopsided advantage in manpower. The population of English North America's colonies in 1689 was nearly 250,000 people—more than 20 times that of New France. This large population provided governing authorities a formidable base from which to recruit troops. Second, the colonists believed they could count on military and naval support from the mother country. And third, the English colonies were allied with the largest and most powerful Native American tribal group in the Northeast, the Iroquois Confederation.

None of these strengths proved decisive, however. Although much smaller numerically, the French could draw on a large number of males, many of whom had military experience. England, though fielding a large army, had to post most of its troops to Flanders and Ireland to parry French threats and internal unrest among the ousted James II's Catholic supporters. The ground and naval forces sent by the English government to the Western Hemisphere

Depiction of the French and Native American raid on the frontier settlement of Schenectady, New York, February 8–9, 1690. Wood engraving, ca. 1850. (The Granger Collection)

were deployed mostly to the West Indies to protect its possessions there. Also English America was divided among a number of colonies each with sovereignty over finances and military manpower while New France was unified under the authority of one governor. Finally, the Iroquois tribes, although eager for plunder in Canada, were beset with internal divisions and relentless guerilla attacks from their pro-French rivals.

While colonial authorities in New York and New England struggled to organize their forces, Frontenac sent mixed French and native war parties into northern New York and New England to raid remote and vulnerable English towns. On February 8, 1690, one such force raided the village of Schenectady, New York, killing 60 people and carrying off 27, and burning the settlement. The French and their American Indian compatriots struck again about a month later, hitting Salmon Falls, New Hampshire, not far from Portsmouth. The attackers killed 34 and took 54 hostages. In yet

another attack in May 1690, 500 French and natives laid siege to Fort Loyal (Portland), Maine, forcing the small garrison into submission. When the English colonists surrendered, the French commanders stood by while their allies killed some 100 men, women, and children before burning the fort.

News of these attacks triggered a wave of terror among the English colonists and moved authorities in New York, Massachusetts, and Connecticut to raise militias. The northern English colonies then tried to launch a two-pronged invasion of French Canada via Lake Champlain and through the St. Lawrence Valley against Montreal and Quebec, respectively. Their efforts foundered on internal divisions growing from the upheavals of the Glorious Revolution.

In April 1690, the first intercolonial conference assembled in New York City with representatives from Massachusetts Bay, Plymouth, Connecticut, and New York attending (Maryland and Rhode Island promised financial support). There they agreed to furnish troops for an overland expedition against Canada. In addition, the Iroquois promised to send 800 warriors.

Efforts to raise and organize militias and launch the expedition suffered amidst political bickering, supply shortages, and an outbreak of smallpox. New York's lieutenant governor, Jacob Leisler, hoped to command the force himself. But he had so many political enemies that he dared not leave the state. When he tried to appoint his friend and son-in-law, Jacob Milborne, the already mobilized men and the province of Connecticut objected. Their preference was Major Fitz John Winthrop, a former English army officer. Milborne had to settle for the post of commissary. In that capacity, he bungled the procurement and delivery of supplies for the expedition. In addition to command infighting and supply shortages, a smallpox outbreak devastated both the Iroquois and the colonists.

The joint overland expedition against Canada ended in an embarrassing failure. The Massachusetts Bay and Plymouth colonies, preoccupied with raising their own forces to send against Acadia and Quebec, never sent any troops. New York raised 150 men, but leaderless and unpaid, they were on the verge of mutiny. Despite the lack of supplies, Winthrop moved his force northward at the end of July 1690. The men camped at Wood Creek near its juncture with Lake Champlain and waited for supplies and the Iroquois to make more. However, it was the wrong time of year for stripping birch trees for bark, and no supplies materialized.

Despite these setbacks, Winthrop gave permission to one of his young officers, Captain John Schuyler, to proceed down the lake with 29 soldiers and 120 native warriors on a raiding expedition. They left on August 13. On August 23, having paddled the length of Lake Champlain and entered the Richelieu River, they attacked the French settlement of La Prairie across the St. Lawrence from Montreal. The English attackers killed 6 men, took 19 prisoners, shot a number of cattle, and burned several houses, barns, and haystacks. Fearing a reaction from the large Montreal garrison and with no sign of the rest of the expedition, Schuyler withdrew. Meanwhile, Winthrop had decided to return to Albany.

The collapse of the overland expedition fanned discontent with Leisler's inept and autocratic leadership. The arrival of Major Richard Ingoldsby and two companies of English regulars in New York harbor in late January 1691, followed shortly by William III's new royal governor, Henry Sloughter, led to the downfall, arrest, trial, and subsequent hanging of both Leisler and Milborne for treason. The failure of the Lake Champlain expedition also damaged intercolonial cooperation and undermined the confidence of the Iroquois in their English-American allies.

In the summer of 1691, Sloughter sought to rectify the political fallout from the previous year's fiasco by sending another expedition against Montreal. After shoring up support among the Iroquois at a May conference in Albany, he ordered a mixed band of colonists and natives organized by Albany mayor Peter Schuyler on another raid against Montreal. Schuyler departed Albany on June 22. The force reached Montreal a month later, again via Lake Champlain in canoes. On August 1, it struck the village of La Prairie for a second

time, overrunning it. Schuyler and his men repulsed one counterattack but were obliged to withdraw on the appearance of reinforcements from Montreal. Fighting through a French ambush, Schuyler's detachment returned to Albany.

Although more successful than the 1690 raid, Schuyler's raid did not significantly alter the political and strategic balance between French and English America. The French did not mount any major raids in 1691 or 1692. And, hampered by the unexpected death of Sloughter in July and with only limited funds for raising troops, New York authorities were content to maintain a small garrison of 150 men at Albany and encourage the Iroquois to raid into Canada and blockade the fur trade on the St. Lawrence.

The arrival of a new governor, Benjamin Fletcher, in August 1692, did not alter New York's quiescence. Unable to raise money from the already overtaxed colonists, Fletcher had to be content with encouraging the Iroquois and asking the other colonies for help. The precariousness of New York's position became clear in July 1696 when a large French-native force, commanded by Frontenac himself, invaded central New York. The attackers terrorized the Onondaga tribe and burned several English settlements. By the time Fletcher was able to borrow money from the other colonies, the attackers had departed. The raid made clear to the Iroquois that New York authorities could not protect them.

Over the ensuing six years, the pattern established in New York persisted. The ground fighting followed a cycle of fierce raids interspersed with periods of inactivity. The French, driven by Frontenac's ambitions, continued to encourage native raids, particularly by the Abenakis, against both the Iroquois and the Anglo-Americans.

The English colonists, in turn, sought to raise sufficient manpower to protect their outlying settlements and deter French attacks. Like their counterparts in New York had done in the Lake Champlain Valley, leaders in Plymouth and Massachusetts Bay made independent efforts to take the offensive in northern New England. For this they commissioned Major Benjamin Church, a veteran of King Philip's War (1675–1676), to organize troops and take the offensive in Maine. With a force of 300 men, Church sailed to Casco Bay in September 1691 and raided Abenaki villages near present-day Brunswick and Lewiston.

Although Church did not achieve decisive success, his expedition hurt the Abenakis sufficiently that they agreed to a peace treaty at Kennebec in November. This agreement lasted only until the following winter and early spring when, under French prodding, the Abenakis struck the Maine villages of York and Wells. In retaliation, the new governor of the crown colony of Massachusetts, Sir William Phips, accompanied Church on another expedition against the Abenakis. They established a new post, Fort William Henry, on the Maine coast near Saco Bay and raided into Abenaki territory. An attempt by the French to take the fort by sea failed when the commander of the naval expedition, Pierre Le Moyne d'Iberville, decided that his forces were insufficient and withdrew without firing a shot.

424 King William's War, Naval Campaigns

The New England frontier remained stable for approximately three years. Massachusetts, by now in the throes of the Salem witch hysteria, could provide only limited forces. French authorities, smarting from their failure at Fort William Henry, were struggling to keep their native allies from negotiating with the English. A militia force of 300 under Captain James Converse kept the peace and deterred any serious American Indian raids. In August 1693, Converse negotiated a peace with 13 Abenaki chiefs. This broke down later when, aroused by the new French commandant at Penobscot, Sieur de Villieu, 250 Abenakis overran Oyster Bay, New Hampshire, in July 1694. This force ravaged the New England frontier as far west as New York. Subsequent attempts to reestablish peace fizzled, and sporadic raiding continued throughout 1694–1695.

The last major clash on the New England frontier occurred in July 1696 when a mixed detachment of two French regular companies and 250 Native Americans supported by two French warships appeared off Fort William Henry and induced the commander, Captain Pasco Chubb, to surrender without resistance. The French restrained their allies from killing Chubb or any of his men but spent three days plundering the fort before withdrawing back to their fort at Penobscot.

In response, Massachusetts raised 500 men and once again called on Major Church to command an expedition into Canada. Supported by three British vessels, Church landed at Penobscot, but he found that most of the French and natives had departed. He then moved his men up the coast to the Bay of Fundy, killing a few natives and burning the settlements in his path. There was no organized resistance.

Maine remained relatively secure until the war ended in 1697. News of the Treaty of Ryswick, which concluded the War of the League of Augsburg in 1697, effectively ended the fighting between the English colonists and New France. But it did not end warfare between the Iroquois and the pro-French tribes.

King William's War, Naval Campaigns

Start Date: May 1689 End Date: 1697

As was the case in the ground war, both the British and the French colonists had to rely on their own resources to fight King William's War on water. Indeed, the war in Europe and the security of their Caribbean holdings claimed first priority on the two main belligerents' naval forces. Facing threats from a large French fleet in home waters and concerned for the safety of their colonies in the Caribbean, England could not provide the ships its colonists expected. Likewise, French king Louis XIV kept most of his fleet in European waters to threaten England, protect the French coasts, and support the exiled James II's Catholic allies in Ireland.

The Anglo-Dutch navies and the French fought major naval engagements in European waters at Bantry Bay (May 1689), Beachy Head (July 1690), and La Houge (May 1692). The cumulative result of these actions was a stalemate at sea with little effect on the overall strategic balance of power in either Europe or North America. In North America both protagonists carried out their naval operations with smaller, less well-armed, and often decrepit vessels.

These limitations and their consequences became painfully apparent during the combined naval and land offensive mounted against Quebec in the fall of 1690. This operation formed the second prong of the planned attack on French Canada. The first had been the overland thrust against Montreal, but by the time the seaborne expedition had reached Quebec, the effort against Montreal had already failed. The Quebec expedition was organized and financed almost entirely by the Massachusetts Bay Colony, which had raised nearly 2,000 men and outfitted 34 ships for it. Massachusetts governor Sir William Phips had command. Earlier that year, he had seized Port Royal on the Acadian coast.

The Quebec expedition departed Boston on August 21, 1690, with four months of supplies. However, Phips had overlooked the need for a pilot who knew the St. Lawrence River. Due partly to their ignorance of the river and partly to bad weather, the New England force did not reach Quebec until three weeks into October. By then, supplies were running low and the weather was already cold.

The French were waiting for them. The failure of English efforts to threaten Canada by overland attacks from New York left the French free to reinforce the Quebec fortress. By the time Phips arrived, there were nearly 3,000 French Army regulars and militia concentrated in the area. Unaware of the number facing him, Phips

French Canadian Pierre Le Moyne d'Iberville, identified by many as the first Canadian military hero, shown here directing the defeat of English ships in Hudson Bay in 1697. Pen-and-ink drawing by Charles William Jefferys. (The Granger Collection)

demanded that the city surrender. Gov. Louis de Buade de Frontenac himself answered with defiant resistance. If the New Englanders wanted the fortress, they would have to break down the walls with their ships' cannon or storm it with infantry.

Phips and Major John Walley, commander of the ground troops, responded by attempting to take Quebec from the rear. They landed more than 1,200 men on the north shore of the St. Lawrence, where the St. Charles emptied just east of the city. There they found 600 Frenchmen posted in the woods, and a violent battle began. Phips sent six field cannon to aid Walley, but they sank into the marshy ground. The New Englanders persisted and finally dislodged the French. In doing so, however, they used up most of their food and ammunition and could not pursue their retreating adversaries. Requests to the ships for resupply yielded only half a barrel of gunpowder.

At this point, communication breakdowns further hampered attempts to take the city. Unaware of Walley's predicament, Phips pulled away from the shore and commenced shelling Quebec from the river without any coordinated advance by the soldiers. The shelling did little damage, as the ships' guns had only limited range and lacked the power to breach the walls of the fortress. Phips persisted for nearly two days until French counterbattery fire from the shore seriously damaged two of his ships, whereupon Phips withdrew his vessels and reestablished contact with Walley's infantry. With only limited amounts of food and ammunition, the New Eng-

land troops attempted one more unsupported attack, which the French once again repelled. At this point, with no more gunpowder available, food running low, and smallpox breaking out, Phips and Walley withdrew. Ironically, the expedition had come close to achieving its goal. Had the fleet remained another week, Quebec might have fallen because of a shortage of food for its refugee-inflated population.

In the course of the return to Boston, Phips had to scuttle two vessels that had been damaged by fire from the French batteries at the Quebec fortress. One other burned in an accident. Two hundred men perished in the accident and from disease. Phips himself reached Boston harbor in late November. The rest of his ships arrived later, giving him the opportunity to establish his version of events and exonerate himself. Fortunately for Phips, the Massachusetts Calvinists blamed God rather than Phips's incompetence for the setback.

The Quebec expedition was the largest seaborne operation of the war in North America. Drained financially by its failure and unable to garner support from the other colonies, Massachusetts officials had to content themselves with limited defensive measures. Subsequently, both English and French naval forces mounted small operations, usually in support of coastal landings by infantry. Typical of these were the sortie by Phips and Church to build Fort William Henry near Pemaquid, Maine (then part of Massachusetts), a failed counterstroke by the French in 1692, and a successful operation by the French to force the surrender of the fort in July 1696.

The naval exploits of Pierre Le Moyne d'Iberville in that same summer of 1696 and the following year proved heartening for the French and unsettling for English colonists along the Maine and Newfoundland coasts and in Hudson Bay. After capturing Fort William Henry, d'Iberville moved his operations to the east coast of Newfoundland where he raided English fishing settlements, killing or capturing most of the inhabitants. Early the following year, d'Iberville sailed into Hudson Bay, where he defeated a force of three British warships and seized the post at Fort Nelson.

Overall, the French had prevailed in the naval engagements in North American waters, but they were unable to exploit their successes. Louis XIV dispatched a squadron of 15 ships to Newfoundland with the goal of raiding Boston. They reached Newfoundland in the summer of 1697 but could not proceed farther because of supply shortages. News of peace in Europe resulted in cancellation of the operation. As on land, the naval balance of power in North America remained unchanged.

Kittanning, Battle of

Event Date: September 8, 1756

Battle that took place on September 8, 1756, at the Delaware settlement of Kittanning on the Allegheny River in western Pennsylvania (current-day Armstrong County). The battle led to the destruction of Kittanning, which had served as a staging area for attacks by Delaware (Lenni Lenape) and Shawnee warriors against British colonists in Pennsylvania during the French and Indian War (1754–1763).

Beginning around October 1755, raids on Pennsylvania settlements by Delaware and Shawnee war parties, backed by the French, increased in number. After the destruction of Fort Granville (near current-day Lewistown) on July 30, 1756, Gov. Robert Hunter Morris ordered the Pennsylvania Militia to destroy Kittanning. The soldiers were also supposed to recapture a reported 100 British prisoners reportedly being held there. Kittanning was also the home of two notorious leaders of the native raids, Captain Jacobs and Shingas, and the governors of both Pennsylvania and Virginia offered a reward for these men's scalps.

In August 1756, Lieutenant Colonel John Armstrong, commander of the 2nd Battalion of the Pennsylvania Regiment, led a party of approximately 300 men on the Kittanning Expedition. The men arrived by various routes at the appointed gathering spot of Fort Shirley to collect provisions. The main body of the provincial force departed Fort Shirley on August 30, 1756. It reached Kittanning on the evening of September 7.

The fighting commenced the next day, September 8. It pitted the 300 Pennsylvanians against some 100 natives who held perhaps 50 prisoners. The fighting was concentrated in two areas, the settlement of Kittanning and an area of higher ground above the town, later referred to as "Blanket Hill" because of the loss of supplies in that area.

During the fight, many of the natives and their prisoners escaped; however, Captain Jacobs and his family were among those who remained to defend their homes and town. In response, the militia set fire to the town, leading to the explosion of stored gunpowder and the ensuing death of Captain Jacobs and other inhabitants.

After roughly six hours of fighting, the village lay in ruins and the disorganized Pennsylvania forces had dispersed. Many of the natives and their prisoners withdrew and resettled in nearby French forts and towns on the Big Beaver River. Approximately 17 of the Pennsylvania troops died in the fighting; another 13 were wounded, and 19 others were reported as missing. An unknown number of natives were casualties, although most historians now agree that the Delawares and the Shawnees sustained fewer casualties than their attackers. Only 11 white prisoners returned to English hands.

Despite these numbers, John Armstrong claimed victory in his report of the expedition sent to Gov. William Denny, who replaced Morris on August 20, 1756. After the battle, two tributes to Armstrong and his men were published in the *Pennsylvania Gazette*. Colonial officials commissioned medals for the officers, and gifts of money and silver were made to soldiers and their families. Additionally, the colonial Assembly granted Armstrong land rights, including the old Kittanning town. He renamed the area "Victory."

The Battle of Kittanning did kill some of the natives, including Captain Jacobs, and others, including Shingas, were dispersed. Although the campaign did not remove the necessity of consolidating the western defenses of the colony, the colonial government found it a useful propaganda tool.

La Belle Famille, Battle of

Event Date: July 24, 1759

French attempt to lift the British siege of Fort Niagara (New York) during the French and Indian War (1754–1763). La Belle Famille is located roughly one mile south of Fort Niagara. British troops arrived at the site on July 6, 1759, and began the siege of Fort Niagara on July 10. Sir William Johnson, the British liaison with the Iroquois, had raised some 400 Native Americans, half of them Iroquois, and commanded operations.

The siege progressed quickly, and the only hope for the French was the timely arrival of a relief force from Fort Machault (Pennsylvania). That force consisted of some 800 regulars and militiamen commanded by Captain François Le Marchand de Lignery. The relief force arrived in the vicinity of Fort Niagara on July 23.

At the beginning of the siege, the Senecas, at the time allied with the French, had decided to take a neutral stance. This decision was in part prompted by the Iroquois support of the British campaign against Fort Niagara. In the battle over Fort Niagara, Native American allies on both sides sat it out; that is, until the end.

The Iroquois warned the British of the approach of the French relief force. The British thus had sufficient time to dispatch a force of their own from those involved in the siege to intercept the French. Led by Lieutenant Colonel Eyre Massy of the 46th Regiment of Foot, it numbered some 350 British regulars and 100 New York colonials.

The British intercepting force arrived first and proceeded to construct breastworks and an abatis across the road that the French would take to reach the fort. Massy positioned his main force in the center with light infantry and grenadiers on the flanks. Meanwhile, Johnson, having learned of the approach of the French relief col-

umn, sent Iroquois emissaries to the natives accompanying it. The messengers persuaded the native auxiliaries not to take part in the coming fight. Because the British Native American allies also chose to sit out the fight, this left only the regular soldiers on both sides to wage the battle.

As the French approached the clearing at La Belle Famille, Massy ordered the main body of the 46th Foot to fix bayonets and assume a prone position to await the French arrival. At about 8:00 a.m. the French troops moved out of the woods south of La Belle Famille and formed into line, then advanced on the British position, firing their muskets as they moved forward. The British held their fire until the French were only about 30 yards from their own position, then stood up and fired several volleys. The British grenadiers on the right flank were able to fire into the flank of the advancing French. This concentrated fire disrupted, then broke the French advance. The British then charged the disorganized French, who fled from the field of battle. At that point the British Iroquois allies decided to join the fight, chasing the fleeing French troops and killing and capturing many of them. The French reported 344 men killed or captured, mostly by the Iroquois. Among the critically wounded was the French commander, Lignery.

The failure of the French to lift the siege of Fort Niagara ensured its fall to the British. The fort surrendered on July 25.

Lachine, Battle of Event Date: August 5, 1689

Iroquois raid on the French Canadian village of Lachine, located near Lake St. Louis in New France, during King William's War (1689–1697). When the Iroquois, longstanding enemies of the French, received word in 1689 that their English allies were at war with France, they saw an opportunity to please their friends, discomfit their foes, and benefit themselves all at once. Accordingly, an Iroquois war party, estimated to have been 1,500 strong, prepared to attack the French.

On the evening of August 4, there was a hailstorm on Lake St. Louis, an extension of the St. Lawrence River abutting Montreal Island. Under cover of the storm, the Iroquois warriors crossed the waters to the French settlement of Lachine. Though the village boasted three stockade forts, the Iroquois eluded detection by the garrison and dispersed throughout the village.

The Iroquois struck at dawn on August 5. The colonists, surprised and unprepared, offered little resistance as the Iroquois burned houses and killed, captured, or drove off the inhabitants. Having plundered the town of its brandy, many of the Iroquois became drunk. Had the Canadians attacked then, as they were preparing to do, the Iroquois might have suffered a serious defeat. But no attack came. Some refugees from Lachine had reached Montreal and, terrified by their ordeal, had given New France's Gov. Jacques-René de Brisay, Marquis de Denonville, fragmentary and exaggerated reports of the Iroquois' strength. Uncertain of how many foes the city faced and where they were, Denonville commanded his soldiers not to engage the enemy but rather to assume a defensive posture and await further developments.

Denonville's decision, which seemed prudent at the time, cost the French the opportunity to retaliate. By evening the Iroquois had recovered from their revelry and retreated back to the mainland. To attack them then would have been reckless, and Denonville demurred from doing so.

Although the Iroquois killed 24 people at Lachine and captured fewer than 90 others, initial reports gave far higher figures. By the

The Iroquois massacre of French settlers at Lachine, near Montreal on the St. Lawrence River, August 5, 1689. From a painting by C. W. Jefferys. (The Granger Collection)

time Louis de Buade, Comte de Frontenac, already selected to replace Denonville as governor, arrived in the colony, those reports had spread terror of the Iroquois throughout New France.

Frontenac used the Lachine "massacre" to galvanize the colony's resolve to fight. His efforts in that regard contributed to the attack's place in Canadian national mythology: as recently as the late twentieth century some historians have cited the Battle of Lachine as evidence, however spurious, that New France's Native American enemies were fundamentally barbaric.

La Corne, Luc de

Born: ca. 1711

Died: October 1, 1784

North American-born French military officer and fur trader. Luc de La Corne (his birth name) was born at Contrecoeur, Quebec, probably in the autumn of 1711, into one of New France's most prominent families. Throughout his career, Luc de la Corne combined his service as an officer in the troupes de la marine (French marines/colonial regulars) with a lucrative involvement in the fur trade. In addition to making him one of the wealthiest men in New France, his long service in the Great Lakes region enabled him to forge close ties with the western Native American peoples. He became fluent in a number of Native American languages and often served as an interpreter for the French authorities. He carried out this role in 1755 for Gov. Pierre Rigaud de Vaudreuil de Cavaignal during a series of conferences intended to keep the Senecas from fighting alongside the British in the French and Indian War (1754-1763). Indeed, La Corne's close ties to Native Americans made him a logical candidate to serve as New France's main recruiter of Native American allies. He also led them in battle on several occasions.

Made an ensign in the troupes de la marine in 1742, La Corne was placed in command of a detachment of Canadians and Native Americans during King George's War (1744–1748). In 1746, he helped defend Fort St. Frédéric (New York) by harassing the English around Lake George. In June 1747, La Corne's irregulars captured part of the garrison of Fort Clinton (Fort Saratoga). La Corne was promoted to lieutenant in 1748 and to captain in March 1755.

Two years later during the French and Indian War (1754–1763), La Corne earned the undying hatred of Anglo-Americans as commander of the Native Americans who, on August 10, 1757, killed many members of the surrendered British garrison of Fort William Henry. La Corne had been chosen by the French commander, Major General Louis-Joseph, Marquis de Montcalm, to escort the British soldiers and their dependents to nearby Fort Edward, but La Corne was unable to control his Native American warriors. The Fort William Henry debacle did not besmirch La Corne's reputation in Canadian eyes, however. In July 1758, following Montcalm's victory at Ticonderoga, a detachment of 400 Canadians and Native Americans under his command intercepted and destroyed a British supply convoy en route to Fort Edward. La Corne's men captured 64 of the enemy and took 80 scalps. He was rewarded for this exploit with the Cross of Saint Louis in November 1758, and in January 1759 he was made a knight of Saint Louis. La Corne's last act in the French and Indian War was to command the Native American contingent in the vanguard of the victorious French army at the Battle of Sainte Foy in April 1760, during which he was wounded.

La Corne joined those French Canadians who opted to return to France following defeat by the English in 1761. He was never to reach France, however, as the vessel on which he and his family had sailed went down off Cape Breton Island in November 1761. La Corne was one of only seven survivors. He then embarked on a 100-day trek across the wilderness through Nova Scotia and New Brunswick and up the St. John's River to Quebec. The journey took him until February 1762. The journal he kept during his journey was published in Montreal in 1778.

La Corne tried to make a new start for himself in Canada. Convinced that the British occupation would not last, he intrigued with the Native Americans to take up arms. However, when the failure of Pontiac's Rebellion in 1763 indicated that the British were in Canada to stay, La Corne managed to ingratiate himself with the rulers of the colony.

During the American Revolutionary War, American troops captured La Corne in the course of their invasion of Canada in 1776. Following brief imprisonment in New York and Pennsylvania, he returned to Canada to command the Native American contingent in British major general John Burgoyne's army invading New York from Canada. Following the British defeat at Saratoga in October 1777, Burgoyne blamed La Corne for the disaster in a speech to Parliament. He charged that the Canadian had failed to prevent the Native Americans from deserting his army. One of La Corne's last public acts was to publish in English newspapers a refutation of Burgoyne's charges. La Corne held that it was the general's own indifference to the natives that had caused them to decamp. La Corne died in Montreal on October 1, 1784.

Lake Champlain

Strategic waterway that serves as the northern boundary between modern-day New York and Vermont and that extends some 5 miles into the Canadian province of Quebec. Lake Champlain is approximately 102 miles long and links the St. Lawrence watershed and the Hudson River. In the colonial period, the lake provided a water route for both trade and warfare for the British, the French, and each side's Native American allies.

On several occasions, English armies advanced from Albany, New York, up the Hudson Valley to the "Great Carrying Place" (later Fort Edward). They then made a roughly 12-mile portage to Wood Creek, at Lake Champlain's southern end. From there, the lake extends about 100 miles to the northward-flowing Richelieu River and ultimately to the St. Lawrence River above Montreal. Alternatively, some forces marched from the Great Carrying Place to nearby Lake George, a 30-mile-long finger lake that parallels Wood Creek and joins Lake Champlain near Ticonderoga, New York. For French and native raiders, the Champlain Valley offered easy access from Canada to the New England and New York frontiers.

French explorer Samuel de Champlain, the lake's first European visitor and namesake, traveled the lake along with some 60 Hurons and Montagnais in 1609. During a battle with a Mohawk war party on July 30, 1609, Champlain routed the Mohawks, reportedly killing two and mortally wounding a third with a single discharge of his musket. Though he won the battle, Champlain helped create enmity between New France and the Iroquois Confederation.

During the Anglo-French wars of the late 17th and 18th centuries, Lake Champlain played a central role. With King William's War (1689–1697), the English created the strategic blueprint for the next 70 years of warfare in the region. It involved a seaborne attack against Quebec, while a diversionary force advanced on Montreal through the Champlain Valley. During the summer of 1690, Connecticut colonel Fitz-John Winthrop bivouacked a provincial army at Wood Creek. Facing severe logistical problems, smallpox, and a lack of Iroquois support, the expedition crumbled.

In 1709, during Queen Anne's War (1702–1713), Colonel Francis Nicholson advanced from Albany in conjunction with a British offensive against Quebec. However, the supporting forces never arrived. Again, in 1711, Nicholson advanced only to learn that Admiral Sir Hovenden Walker had abandoned the Quebec campaign. While at Wood Creek, Nicholson constructed a small fort in 1709 and rebuilt it as Fort Anne in 1711. An earthwork post, Fort Mud, occupied the site in the 1750s.

To repel future invasions, in the 1730s the French constructed Fort St. Frédéric at Crown Point on the lake's western shore, 10 miles north of Ticonderoga. During King George's War (1744–1748), the stone citadel served as a staging area for numerous French and native raids on the British colonial frontier.

On the outbreak of the French and Indian War (1754–1763), Colonel William Johnson's provincial army reached Lake George's southern tip, en route to Fort St. Frédéric. French commander Jean Armand, Baron de Dieskau, struck Johnson's camp at the Battle of Lake George, halting the English advance. Johnson constructed Fort William Henry on Lake George's southern shore, while the French began building Fort Carillon at Ticonderoga, to the north. French forces from Fort Carillon besieged and destroyed Fort William Henry in 1757.

The following year, French-led forces repulsed the English outside Fort Carillon. In 1759, Major General Jeffery Amherst's British forces systematically advanced down Lake George. After a brief siege of Carillon in July, the French rear guard detonated the magazine and withdrew. They later destroyed Fort St. Frédéric as well. Amherst rebuilt Fort Carillon as Fort Ticonderoga and erected a larger Fort Crown Point to support the 1760 offensive against Montreal. When fire destroyed Crown Point in 1773, a token British presence remained at Ticonderoga until Patriot forces seized it in May 1775. Lake Champlain continued to play a pivotal role in the American Revolutionary War.

Lake George

Strategic waterway in the Hudson River–Lake Champlain Valley situated roughly 50 miles north of Albany, New York. Located in eastern New York State, this 30-mile-long finger lake parallels the southern part of Lake Champlain. It connects with Lake Champlain

An 18th-century illustration of Lake George and Fort Ticonderoga. The fort, originally built by the French as Fort Carillon in 1755, played a prominent role in both the French and Indian War and the American Revolutionary War. (Library of Congress)

via the 4-mile-long La Chute River near Ticonderoga, New York. A series of waterfalls required a 2-mile portage to the larger lake. From Ticonderoga, Lake Champlain extends northward approximately 75 miles, emptying into the Richelieu River and ultimately into the St. Lawrence River above Montreal. Southern Lake George lies about 12 miles from the Hudson River Valley. Both the English and the French used the Hudson Valley and the Champlain Valley for trade as well as intermittent warfare through the 17th and 18th centuries.

In 1609, native guides brought French explorer Samuel de Champlain to Lake George, which he named Lac du St. Sacrement (Lake of the Holy Sacrament). The Champlain Valley marked a contested area between the French-allied Algonquins and their traditional opponents, the Dutch and later English-backed Iroquois Confederation. French and Native American raiding parties traveled across the lakes' winter ice to attack the New York frontier in 1690.

Before 1755, Anglo-American armies trying to capture Montreal had marched from the Hudson to Lake Champlain directly. However, in 1755, more than 3,000 men under Colonel William Johnson advanced to Lake George with a goal of capturing Fort St. Frédéric at Crown Point on Lake Champlain. Rather than wait for Johnson's attack, the French fort's commander, Jean Armand, Baron de Dieskau, launched a spoiling attack against Johnson's entrenched camp on September 8, 1755.

Although defeated and captured during the Battle of Lake George, Dieskau halted Johnson's advance. Johnson's men constructed Fort William Henry near Lake George's southern end, and the French constructed Fort Carillon at Ticonderoga to the north. Johnson renamed the lake "Lake George" after King George II.

On March 19, 1756, a force of some 1,500 French and natives attacked Fort William Henry, laying siege for four days and destroying boats and outbuildings before withdrawing. The following year, a French army of more than 8,000 men captured the fort on August 9 after a brief siege. The men burned Fort William Henry before withdrawing back to Fort Carillon.

Undeterred, Major General James Abercromby led nearly 14,000 men against Fort Carillon in 1758. After constructing Fort George, a supply base with more than 300 buildings, near the ruins of Fort William Henry, Abercromby's forces advanced unopposed down Lake George aboard more than 800 bateaux and whaleboats. Despite outnumbering the French by nearly four to one, Abercromby launched a series of disastrous frontal assaults against entrenched French positions on July 8, 1758. After his force sustained heavy casualties, a demoralized Abercromby withdrew to Fort George.

On July 21, 1759, Abercromby's successor as British commander in chief, Major General Jeffery Amherst, departed Fort George with 11,000 troops. Within five days they had captured Fort Carillon. The small French garrison destroyed that post as well as Fort St. Frédéric, before retreating to Lake Champlain's northern end. Lake George remained a vital supply artery for the 1760 campaign against Montreal.

Lake George, Battle of

Event Date: September 8, 1755

Battle between French, Canadian, and American Indian forces commanded by Maréchal de Camp Jean Armand, Baron de Dieskau, and British colonial forces under Major General Sir William Johnson, on September 8, 1755. When Major General Edward Braddock arrived in Virginia in the spring of 1755, he found sufficient manpower under his command in North America for four separate expeditions

to Fort Duquesne, Niagara, Crown Point, and Fort Beauséjour. Throughout King George's War (1744–1748), and as recently as 1754, Crown Point had served as the staging ground for Canadian and American Indian raids against British colonial settlements in New York and New England. It was therefore among the most important symbolic targets, at least, of British operations in 1755.

Commanding the expedition to Crown Point was William Johnson, colonel of the New York Militia who enjoyed good relations with the Mohawks. He had been given a commission as a major general for this particular campaign. Like the expedition to Niagara under Major General William Shirley, Johnson was to set out from Albany on a European-style campaign, building a road and bringing artillery in anticipation of a conventional siege. Shirley and Johnson squabbled over supplies and men, and the expedition to Crown Point was left short-handed in both respects. Johnson had able subordinates, such as Colonel Phineas Lyman and Captain William Eyre, but otherwise had to adapt to an unfamiliar mission, force composition, and command structure.

From July through early September, Johnson and his subordinates conducted several expeditions up the Hudson River toward the southernmost extremities of Lake Champlain—Wood Creek to the east and Lac du St. Sacrement (which Johnson renamed Lake George) to the west. At the nearest portage, about 12 miles southwest of the old site of Fort Anne on Wood Creek and about 14 miles southeast of Lake George, Johnson's force built Fort Edward. This

Plan of the Battle of Lake George, New York, on September 8, 1755, at which Sir William Johnson defeated a force of French and allied Native Americans. (Bettmann/Corbis)

was to serve both as a defensive outpost and as the base for further operations toward Lake George, where Johnson anticipated launching a naval expedition against Crown Point.

To move supplies from the Hudson to Lake George, Johnson's force constructed a road capped by a second fortified camp, the nucleus of Fort William Henry. By early September the road was almost complete, just in time for the arrival of a large force of French, Canadians, and American Indians coming down Wood Creek under Baron Dieskau.

Anticipating a raid on Fort Edward, Dieskau brought 220 French regulars, 600 Canadians, and 700 American Indian allies. Finding a nearly complete fort to his front and saddled with allies who were averse to a siege, on September 7 he doubled back toward Johnson's camp on Lake George. En route, the force encountered several American deserters and learned that a 1,000-man column would be headed down the road the following morning. The ensuing combat on September 8 was really two battles in one, with Dieskau first routing the supply column, and then coming up against Johnson's camp itself.

The "Bloody Morning Scout" (as the 1,000-man column's experiences that day came to be called) consisted mostly of colonial militia but also contained some of Johnson's Iroquois allies, including the Mohawk leader Theyanoguin, better known as Chief Hendrick. Dieskau organized an ambush along the road, which surprised and routed the British column. Despite objections among his American Indian allies and Canadian auxiliaries, Dieskau pushed on to Johnson's camp, seeking to exploit the victory.

What Dieskau found was a partially fortified camp in a clearing, with four cannon pointing down the road. While the French commander tried to persuade his Canadians and American Indians to join the attack, Johnson strengthened his rudimentary defenses. For four hours, Dieskau tried to break Johnson's lines but ultimately failed. Johnson was wounded in what was politely called his thigh, but he continued to fight; Dieskau was among some 20 wounded Frenchmen left after the battle who could not make the retreat.

A third phase of the battle occurred along the Fort Edward Road. Some 220 New Hampshire and New York militiamen en route to reinforce Johnson came upon the site of the ambush earlier in the day and found a larger group of Canadians and American Indians looting what remained. After a sharp fight, the French force was dispersed, and the militia column continued to Johnson's camp. Though the column arrived too late to defend the camp, this force helped to secure the strategic road.

In the aftermath of the battle, the remnants of Dieskau's party regrouped and withdrew, but left Johnson and his force in shock. Johnson abandoned all thought of launching an offensive against Crown Point and redoubled his efforts to fortify the camp on Lake George. Ignoring Shirley's appeals to follow up his victory, Johnson called for reinforcements and spent the winter building defenses for Fort William Henry. The French, meanwhile, built a fort of their own, north of Lake George, at Ticonderoga.

Lake Ontario

Smallest and easternmost of the Great Lakes. Lake Ontario encompasses 7,340 square miles, approximately 193 miles long and 53 miles wide at its greatest width. During the colonial period, Lake Ontario was a strategically significant hub of exploration and expansion because it connected the Hudson River system to the Ottawa River route while providing access to both the St. Lawrence River and the western Great Lakes. Preceding European settlement, the lake had served to demarcate Huron and Algonquin territory in the north from Iroquois possessions to the south, and would come to play the same role for the French and the British in the colonial period.

As early as 1611, Samuel de Champlain had explored Lake Ontario and its surrounding regions, and his associate Étienne Brule's trip across the western end of the lake in 1615 was the first documented visit by a European. By the end of the 17th century, French explorers such as Louis Jolliet and René-Robert Cavelier, Sieur de La Salle, were using Lake Ontario for access to the Ohio Valley and the Mississippi River system. Lake Ontario therefore played an important role in consolidating French holdings in North America, which, by the conclusion of King William's War in 1697, stretched from Hudson Bay to the Gulf Coast.

Because of Lake Ontario's military significance, the French were quick to begin building fortifications on its shores, including Fort Frontenac in 1673, Fort Niagara in 1720, and the Magazin Royale (later Fort Rouillé, on the site of present-day Toronto) in 1726. All of this activity gave France early naval supremacy on the lake. Indeed, as late as 1757, following British defeats at Fort William Henry and Fort Oswego in the previous year, Lake Ontario was still entirely in French hands.

To be sure, dominance of Lake Ontario was more important to the French than it was to the British. Furthermore, disruptions in France's native alliances meant that the lake served to expose the western flank of Canada to incursions by Anglo-America during King George's War (1744–1748) and again during the French and Indian War (1754–1763). Both of these events proved that native alliances, rather than fortifications and military resources, ultimately determined whether Lake Ontario would be an asset or a liability for the European powers in the colonial period.

Lancaster, Conference at and Treaty of

Start Date: June 22, 1744 End Date: July 4, 1744

Agreement between the Iroquois and the colonies of Pennsylvania, Maryland, and Virginia. From June 22 to July 4, 1744, representatives of the Six Nations of the Iroquois met with commissioners from the colonies of Pennsylvania, Maryland, and Virginia at Lancaster, Pennsylvania, to resolve disputes over land claims and other issues. Canasatego of the Onondagas led the native delegation and Conrad Weiser acted as interpreter. In addition to settling the conflict over land, the Iroquois sought the colonies' support in expanding their power over other native nations. The colonists' goal was to secure title to western lands.

The resulting treaty appeared to satisfy both sides. For a payment of £800 in Pennsylvania currency, £300 in gold coin, and some trade goods, the Iroquois ceded all their land claims in Maryland and Virginia to those colonies. The three colonies also recognized Iroquois dominance over several smaller native nations and agreed to permit Iroquois war parties to cross their territory to fight the Cherokees and the Catawbas.

Canasatego believed that he had made an excellent bargain, since the Iroquois' land claims in Virginia and Maryland were dubious at best. However, the native diplomat failed to realize that under its charter, Virginia claimed the entire Ohio Valley region. Virginia's commissioners knew that the Iroquois were unaware of the extent of their claims and that Canasatego had no real right to dispose of land occupied by other native nations. The primary concern of the commissioners was to obtain title to the territory so that the land speculators of the Ohio Company could claim ownership and open the area to settlement.

When Virginia officials tried in the 1750s to enforce their claim to the Ohio Valley under the terms of the Treaty of Lancaster, they provoked a conflict with the French and natives who also claimed the region. The resulting clashes sparked the French and Indian War (1754–1763).

Lance

Long polearm cavalry weapon. Before the advent of firearms, lances were, next to swords, the primary weapon for horsemen. Ranging from 9 to 14 feet in length, lances were made of hardwood, usually ash, and were 1.5 to 2 inches in diameter. The tip was metal, pointed so as to penetrate armor. Although known in ancient times, lances became much more important with the advent of the stirrup, which allowed the rider to brace himself in the saddle. During the charge,

Illustration of a Wampanoag warrior in full regalia and holding a lance, early 1700s. (North Wind Picture Archives)

the rider held the lance stationary, under the arm with the tip forward, using the momentum of the horse for shock power.

Even with the advent of firearms, cavalrymen relied on the lance in part because it was difficult to reload carbines and pistols while moving on horseback. Lances were very much a fixture of European warfare and continued in use even into World War II. They were, however, little employed in colonial North America because there was little open land for cavalry warfare. There were also few cavalry units, even late in the colonial period. Lances were adopted by the Native Americans of the Great Plains after the arrival of the horse.

La Prairie, Battle of

Event Date: August 23, 1690

English raid against a French Canadian village, initially planned as an attack on Montreal, during King William's War (1689–1697). La Prairie (also called La Prairie-de-la-Magdeleine) was located in Quebec Province, on the south bank of the St. Lawrence River, opposite the island of Montreal. A French fort was situated there.

Early in 1690, French and native forces from Canada launched a series of raids against New York and New England settlements, including Schenectady, New York; Salmon Falls, New Hampshire; and Fort Loyal at Casco Bay, Maine (then part of Massachusetts). In April 1690, the colonies of New York, Massachusetts Bay, Plymouth, and Connecticut, convened in Albany without the knowledge of the English government. At the meeting, they devised a plan for launching a shattering blow against New France. The government of Maryland, not represented at the Albany meeting, nonetheless promised to provide troops.

The plan called for a seaborne attack on Quebec, to be carried out by Massachusetts and led by William Phips. At the same time, a force of 855 colonial militiamen plus 1,800 Iroquois would proceed by way of Lake Champlain to attack Montreal. As a condition of Connecticut's participation, Major General Fitz-John Winthrop of the Connecticut Militia was to lead the Montreal attack.

Massachusetts Bay, Plymouth, and Maryland failed to send their contingents. Connecticut provided its 135 men and New York raised 150 of the 400 it had promised. The Iroquois sent about 70 warriors. At the time, both Albany and the western Iroquois villages were suffering from smallpox. About 50 Mohegans accompanied

the Connecticut Militia. This force headed north on July 30 but then stopped at the southern end of Lake Champlain to await provisions that never arrived.

On August 13, Winthrop sent Captain John Schuyler—the 22-year-old brother of the Albany mayor—ahead by canoe with a volunteer force consisting of 29 whites and the 120 natives, to harass the outskirts of Montreal and hopefully divert some French forces from Quebec. Deficient in men, provisions, and canoes and plagued by disease, the rest of Winthrop's party then returned to Albany.

On his way north, Schuyler encountered a band of 28 whites and 5 natives led by a survivor of the Schenectady raid. He persuaded the natives and 13 of the whites to join his expedition. They then continued north on Lake Champlain and debarked on the bank of the Richelieu River near Fort Chambly. From there they proceeded overland and surprised La Prairie on August 23.

Attacking as people returned from the fields, Schuyler's men killed 6 (including 4 women), took 19 prisoners, pierced or shot nearly 150 oxen and cows, and burned houses, barns, and hay. The natives objected to a direct attack on the fort. It transpired that the French governor and 800 men had been in La Prairie but departed the day before. The cannon at the fort began firing signal shots, to which Montreal responded. The raiding party therefore turned southward again, with the natives killing 2 wounded prisoners who were unable to travel. They arrived in Albany on August 30.

Clearly, the expedition did not take Montreal, nor did it divert French troops from Quebec. In any event, Phips did not arrive there until October. Jacob Leisler, New York's rebel governor, blamed Winthrop for the failure and had him jailed, but Connecticut secured his release.

La Prairie, Battle of

Event Date: August 1, 1691

English and Iroquois offensive against the French and their native allies in Quebec, part of King William's War (1689–1697). After the May 16, 1691, execution of Jacob Leisler, New York's rebel governor, the Iroquois complained of the colony's political distractions and of its failure to prosecute King William's War effectively. The Iroquois had been conducting raids along the St. Lawrence River

and Ottawa River. They believed that these assaults had exposed them to retaliation. The Iroquois therefore demanded that New York provide military supplies and take the offensive. New Yorkers, in turn, feared that they would be exposed to attack should the Iroquois indeed drop out of the war.

On May 27, 1691, Gov. Henry Sloughter met with the Iroquois sachems (chiefs) at Albany. After the failure of the 1690 La Prairie campaign, no grandiose schemes were put forward. Albany mayor Peter Schuyler enjoyed a close relationship with the Iroquois, and he offered to lead a raid to spread alarm among the French and thus disrupt their war effort.

Toward that end, Schuyler assembled a force of 120 Albany militiamen, 80 Mohawks, and 66 Mahicans. No other colonies were asked to participate. The target would be La Prairie, Quebec, which Schuyler's brother John had attacked the previous summer.

Schuyler's forces set out on Lake Champlain by canoe and disembarked on the Richelieu River, some 10 miles from Fort Chambly. Schuyler left 27 men to guard the canoes. The remainder then proceeded toward La Prairie on foot through a sizable forest.

Unlike the previous year, the French learned of the party's approach. Indeed, Montreal's Gov. Louis-Hector de Callières had already crossed the St. Lawrence with 700–800 men. Two battalions of regulars encamped to the right of the fort at La Prairie, while Canadians and allied native warriors encamped to the left of it. They waited there for about a week. In the early morning hours of August 1, however, a storm came up forcing them to seek shelter.

That same morning, just before dawn, Schuyler attacked, chasing those in the Canadian camp into the fort. The New Yorkers then encountered a body of French regulars that Schuyler estimated at 420 men and forced them back. The French, however, attacked again and pressed the New Yorkers back 150 yards toward a ravine. There the New Yorkers made a stand and eventually drove the French back in disorder to their fort. The New Yorkers then withdrew slowly toward the river, destroying cornfields as they went.

The La Prairie garrison, their commander ill and his deputy dead, did not pursue the English and Iroquois attackers. At Fort Chambly, however, Captain Philippe Clément du Vuault de Valrennes had heard the shooting. Thus, Valrennes and 160 colonial regulars, militiamen, Hurons, Iroquois Christians, and Algonquins waited in ambush along a ridge that crossed the English route to the river. When they revealed themselves, Schuyler ordered an attack, but was surprised by the strength of the French force and fell back with significant losses. Fearing that he and his men would be caught between the two enemy forces, he ordered another advance. In what has been described as the war's most savage engagement, most of Schuyler's forces succeeded in breaking through the French lines and escaping to the river.

Again, the French did not pursue, and the New Yorkers had the luxury of waiting several hours on the river bank for stragglers to arrive before setting out for home. In their reports, both sides exaggerated the losses they had inflicted on their enemies. The 1691 Battle of La Prairie proved to be New York's last offensive for the

remainder of the war, though it had little impact on the eventual outcome.

La Salle, René-Robert Cavelier, Sieur de

Born: 1643

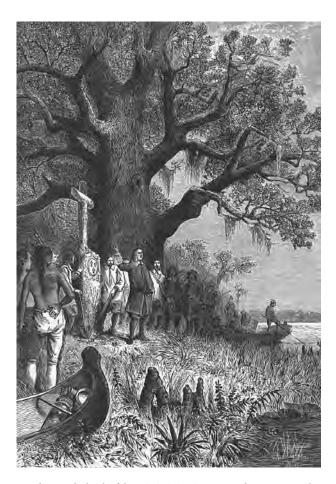

Died: March 1687

French military officer, explorer of North America, and diplomat. Baptized on November 22, 1643, in Rouen, Normandy, René-Robert Cavelier, Sieur de La Salle, was educated by the Jesuits. In 1662 he arrived in Montreal, New France, where he received a grant of land along the St. Lawrence River.

La Salle's great passion was exploration. In 1669 and 1680, he explored areas south of Lake Ontario and Lake Erie. In 1674, he returned to France as the representative of the governor of New France, Louis de Buade, Comte de Frontenac, to explain why Frontenac had taken the initiative in constructing Fort Frontenac at the site of present-day Kingston, Ontario, and to petition for command of the fort, in which he was successful. La Salle returned to France again in 1677 to seek permission to explore and expand the fur trade to the west, and King Louis XIV awarded him a monopoly on trade in the Mississippi Valley.

In 1679, members of La Salle's expedition sailed in the *Griffin*, the first commercial vessel on Lake Erie, to present-day Green Bay, Wisconsin, where the ship was loaded with furs that La Salle hoped would help settle his sizable debts in Montreal, but the *Griffin* was lost on the lake and never heard from again. Unaware of this, La Salle continued down the western shore of Lake Michigan, building first Fort Miami on the St. Joseph River and then Fort Crèvecoeur near Lake Peoria in present-day Illinois in order to protect his men from the elements and hostile Native Americans. La Salle then returned with some of his party to Fort Frontenac to secure supplies for the trip down the Mississippi. He returned to discover that in March 1680, Fort Crèvecoeur had been abandoned.

Undeterred, La Salle again traveled to Fort Frontenac. Meanwhile, a number of his men, who had been captured by Native Americans, found their way to Green Bay. The expedition resumed with additional men and supplies, and, descending the Mississippi, La Salle finally reached the mouth of the river and the Gulf of Mex-

ico on April 9, 1682. He claimed the Mississippi River and all territory watered by it and its tributaries for France, naming it "Louisiana" after King Louis XIV.

La Salle returned to the north to establish Fort St. Louis on the Illinois River in December 1682. He hoped to free himself from the control of French authorities in Canada and establish himself as governor of an independent French colony. La Salle's merchant rivals carried on a campaign against him, obliging him to return to France, where his appeals met with royal favor. The French government saw control of the mouth of the Mississippi as important against Spain, with which France was then at war, and La Salle received the governorship of all Louisiana.

Ordered to establish a settlement near the mouth of the Mississippi, La Salle sailed for Louisiana in 1684 in four ships with about 400 men. The French naval commander, however, refused to follow La Salle's orders, resulting in the Spanish capture of the expedition's principal supply ship. In the West Indies, La Salle fell ill with a fever, with the result that the expedition fell into total disorder. Recovering his health, he continued on with only about 180 men in the remaining three ships, but sailed too far west in the Gulf of Mexico

to land near present-day Matagorda Bay, Texas. La Salle assumed this was the westernmost outlet of the Mississippi, but explorations on land soon convinced him of his mistake. Meanwhile, two of his remaining three ships had been wrecked and the third returned to France.

Down to only 45 men, the expedition's situation was desperate and La Salle set out in January 1687 with a small party to try to reach Canada and secure aid. Along the way, his men mutinied and La Salle was murdered in March 1687 near the Trinity River. Some of his party did reach Fort St. Louis on the Illinois River, but Native Americans killed most of the colonists who remained. While La Salle failed to realize his personal ambitions, his labors gave France a vast new colonial empire and altered the history of North America.

Laudonnière, René Goulaine de

Born: Unknown Died: ca. 1570

French explorer, navigator, and colonizer in Florida. A nobleman from Poitou, nothing is known of René Goulaine de Laudonnière's birth or early years. Laudonnière was second-in-command under Jean Ribault in the French Huguenots' 1562 attempt to colonize the southeastern coast of North America. That attempt, which established a settlement named Charlesfort located on Parris Island, South Carolina, was abandoned after Ribault was imprisoned in England. In 1564, Laudonnière led a new expedition to reestablish a French colony in the area, arriving off the coast in late June 1564.

The settlement, named Fort Caroline and established near present-day Jacksonville, Florida, enjoyed initial success. It boasted 304 colonists, including women, children, farmers, and artisans. Local Native Americans offered food and support. The prosperity was very short-lived, however, as soldiers mutinied and relations with the natives soured. The situation became so desperate that Laudonnière prepared to abandon the colony by late summer.

Meanwhile, Ribault had been released from prison and set out to resupply the colony and relieve Laudonnière of his position. He arrived in mid-August 1565 and brought orders for Laudonnière to return to France and answer charges regarding his management of the expedition. Before Laudonnière could set sail, however, the Spanish arrived in the territory to protect their interests.

Led by Pedro Menéndez de Avilés, the Spanish established a fort and the town of St. Augustine south of the French colony. Ribault moved his men by sea against the Spanish while Laudonnière remained to protect the French settlement at Fort Caroline. Ribault's ships, however, were scattered by a hurricane, allowing the Spanish to march overland and attack the relatively defenseless Fort Caroline. They captured it on September 20, 1565, killing most of the inhabitants. Laudonnière and about 50 others managed to escape to the coast and sailed for Europe. They arrived in France in January 1566. In his retirement, Laudonnière wrote a history of the colony, *Histoire notable de la Floride* (Florida's Notable History), published in 1586. Laudonnière died in France about 1570.

Leisler, Jacob

Born: 1640

Died: May 16, 1691

Colonial New York Militia officer best known for his role in the insurrection known as Leisler's Rebellion. Jacob Leisler was baptized on March 31, 1640, in Frankfurt, Germany, a member of a prominent German Calvinist family. He spent most of his youth in Frankfurt, where his father preached to a congregation of Huguenot refugees. As a teenager Leisler attended a military academy run by the House of Orange-Nassau, perhaps in Nürnberg. His military service eventually led him to the Dutch colony of New Amsterdam in 1660, where he married a wealthy widow. After the English conquered the colony in 1664 during the Second Anglo-Dutch War, Leisler became one of New York's richest and most influential people. A successful merchant, he became second-in-command of the colonial militia with the rank of captain.

The overthrow in 1688 of Roman Catholic English King James II and the accession of William III and Mary II to the English throne had ramifications in the colonies, where many local officials were accused of being Catholics. In 1689 Leisler's orthodox Calvinist beliefs propelled him into the political spotlight. As with many Protestants, he believed that New York's leaders were partners in a

Depiction of Jacob Leisler seizing control of New York in May 1689 on receipt of news of the Glorious Revolution in England and the accession of William and Mary. Colored engraving, 19th century. (The Granger Collection)

Roman Catholic plot, and he joined a rebellion to "preserve" the colony for the British Protestant monarchs William and Mary. Leisler became the leader of an uprising in New York City on May 31, 1689, in which the militia rose up against royal authorities who they believed to be in league with the French. Lt. Gov. Francis Nicholson fled, and Leisler took over his office, claiming that authority from letters from King William to Nicholson. The council at Albany confirmed his authority, although many, especially among the wealthy, opposed him.

Leisler ruled with an iron fist, imprisoning anyone who questioned his power. After the French assaulted Schenectady in February 1690 during King William's War (1689–1697), Leisler became a leader in the intercolonial effort against New France, planning an expedition to capture Montreal with New England forces to attack Quebec. The invasion ended in failure, however.

Leisler's bold style alienated many New Yorkers, and in 1691 he lost his hold on power. Early that year King William's new governor, Colonel Henry Sloughter, arrived with troops under Major Richard Ingoldesby. Sloughter sided with those opposed to Leisler and ordered him to surrender Fort James in New York City. Leisler refused, and several people died in the resulting standoff. Sloughter subsequently charged Leisler and his son-in-law Jacob Milborne with treason. Both men were tried, found guilty, and executed in New York City on May 16, 1691. Leisler was posthumously exonerated by Parliament in 1695.

Leisler's Rebellion

Start Date: May 1689 End Date: March 1691

A revolt in New York triggered by political unrest, economic discontent, class inequities, ethnic and religious tensions, and the Glorious Revolution (1688–1689). The rebellion was named after its chief instigator, Jacob Leisler. It was partially derived from King James II's increasing tendencies to promote Catholicism and centralization. Also at play in the revolt, however, was the preponderant political and economic power enjoyed by English New York City merchants.

In May 1689, a month after the removal of Edmond Andros as governor of the Dominion of New England, the New York Militia ousted Francis Nicholson, lieutenant governor of New York and New Jersey. Nicholson's hesitation in acknowledging the change in government in England had caused his downfall. Lacking instructions, he refused to announce the accession of William and Mary to the English throne. Instead, he moved to protect New York from a possible invasion from New England. He also offered local leaders a safe haven in case of rebellion. In addressing the latter concern, Nicholson understood that New York City and the colony had splintered into numerous factions, each with its own reasons for opposing colonial authorities.

New Englanders now living on Long Island, who had transferred their hatred of the Dutch toward English officials, sought to follow the example of Massachusetts. In April 1689, Boston residents had overthrown the Dominion and imprisoned Andros. Hudson River Valley farmers had been complaining constantly about monopolies granted to city merchants. They also argued that the few families that dominated city and provincial politics used their power to protect their own interests. Such sentiments simply needed a leader—or an event—to spark a rebellion.

Rumors of a plot that would give Catholic France control of New York had been circulating for some time. Nicholson's failure formally to acknowledge William and Mary caused many colonists, especially Dutch supporters of William of Orange, to assume that the rumor of a plot was fact. Leisler, a member of a council established to defend the city against foreign invasion and rebellion, soon seized power.

Leisler, from Germany, had entered New Amsterdam in 1660 as a soldier in the Dutch West India Company. Since then, he had become a prosperous merchant and one of the largest property holders in New York. His marriage to the widow of a wealthy Dutch merchant gave him substantial social standing in the province. Leisler had held numerous political appointments, including juror and court-appointed arbitrator in the English legal system and commissioner to the Admiralty Court. He was also a militia captain. There is no indication that Leisler began the rebellion in New York, but he was well informed of the events in England that led to the removal of King James II.

After a New York Militia revolt drove Nicholson from power in May 1689, Leisler seized control of Fort James. Leisler governed New York efficiently but with a strong hand for about a year, drawing support from all parts of the population, especially Dutch settlers. Leisler strengthened New York's fortifications, ordered local elections, and directed the first codification of New York's laws. In December 1689, he assumed the title of lieutenant governor. Leisler claimed the authority to rule based on letters from King William to Nicholson. The council at Albany confirmed Leisler's authority, although many, especially among the wealthy, opposed him.

Leisler purged his political opposition. He also issued commissions to new officers, collected taxes, and called for a provincial assembly dominated by his own supporters. His legislature redressed

grievances (abolishing trade monopolies of city merchants, for example) and collected taxes to fund King William's War (1689–1697). Leisler also addressed the worst fears in Protestant New York, namely, the "Catholic menace." He oversaw relief efforts to victims of a French and native massacre at Schenectady (February 1690), imprisoned suspected "papists," and organized a convention that saw delegates from Massachusetts, Plymouth, Connecticut, and New York adopt plans to invade Quebec.

Leisler eventually suffered numerous setbacks that led to his removal from power. His letters seeking support from William and Mary were captured by the French, and Leisler's apparent lack of support from the new monarchs allowed Nicholson to criticize Leisler's actions. Consequently, in December 1689 William and Mary appointed Henry Sloughter, an opponent of Leisler, as the new governor of New York. This encouraged Leisler's opponents to challenge the legitimacy of his administration. English colonists complained that Dutch artisans had replaced wealthy English merchants on the Board of Aldermen. The English also opposed Leisler's efforts to promote town meetings that gave Dutch settlers greater political power, and they found fault with Leisler's sympathies toward the lower class. And the failure of the 1690 Quebec campaign provided additional ammunition for Leisler's critics.

In March 1691, following a two-month standoff at Fort James between Leisler and English troops supporting Governor Sloughter that nearly caused civil war, Leisler surrendered. Sloughter ordered Leisler's arrest and indictment for treason. A court dominated by Leisler's enemies promptly found him guilty. On May 19, 1691, Leisler was hanged and beheaded. The English merchants quickly regained control of New York. They reclaimed their positions on the Board of Aldermen and adopted laws that significantly reduced the political and economic power of Dutch settlers.

The harshness of Leisler's punishment soon fueled a campaign to clear his name. In 1695, Parliament reversed the New York court's sentence and legitimatized Leisler's administration, and in 1702 the New York Assembly voted an indemnity of £2,700 to his heirs.

Leisler's Rebellion toppled an authoritarian regime and produced a measure of self-government in New York, albeit briefly. Over the next generation, friction between Leislerians, who favored greater representative government, and anti-Leislerians, who defended the power of the merchant oligarchy centered in New York City, dominated the battle for supremacy in New York politics.

Le Loutre, Jean-Louis

Born: September 27, 1709 Died: September 30, 1772

French missionary who served simultaneously as the religious-political-military representative of the French Crown among the Micmacs and the Acadians. Jean-Louis Le Loutre was born in Morlaix, France, on September 27, 1709. In 1730, he entered the Séminaire du Saint-Espirit (Holy Spirit Seminary). He transferred to the Séminaire des Missions Étrangères (Foreign Missions Seminary) in 1737 before being ordained a Catholic priest and sent to Acadia.

Le Loutre has been accused by contemporaries and historians alike of causing the 1755 Acadian Deportation and inciting Micmac attacks on the British. As a representative of French and Catholic interests, however, he acted as a diplomat among the Micmacs, distributing supplies in the name of King Louis XV. Le Loutre did not, however, exercise dominion over the Micmacs.

His relationship with the Acadians was also problematic. As a French Catholic priest and vicar-general since 1754, Le Loutre viewed Protestant British control of the Acadians as a threat to their immor-

tal souls. Thus he attempted through persuasion and threats to encourage the Acadians to relocate to French territory. It was these activities that earned Le Loutre the undying hatred of the English in Annapolis Royal and in Halifax. In 1755, during the French and Indian War (1754–1763), Le Loutre used heavy-handed tactics to force the Acadians—who had up to this point been neutral—into allying themselves with the French cause. He accomplished this by playing on Acadian fears of English domination, denying the sacraments, and threatening to have his Micmac allies attack Acadian settlements.

Le Loutre avoided capture by dressing as a woman and slipping away with a group of Acadians freed by the British after their capture at Fort Beaséjour in 1755. He made his way first to Quebec and then to Louisbourg by 1759. Le Loutre was taken prisoner at sea by the Royal Navy when the vessel in which he was a passenger was captured while sailing to France. Placed in irons, he was sent to England, where he remained a prisoner until the end of the war in 1763. On his release, Le Loutre returned to France, where he worked among deported Acadians. While endeavoring to establish a new home for expatriated Acadians, Le Loutre died in Nantes on September 30, 1772.

Le Moyne de Bienville, Jean-Baptiste

Born: 1680

Died: March 7, 1767

French colonizer, governor of Louisiana, and founding father of New Orleans. Jean-Baptiste Le Moyne de Bienville was born in Montreal and baptized as an infant on February 23, 1680. He was 1 of 14 children, but his parents died when he was young and he was raised in the household of his eldest brother, Charles Le Moyne de Longueuil. On the death of another brother, François, in 1691, Jean-Baptiste inherited the landed title of Sieur de Bienville, by which name he came to be known.

In 1692, Bienville entered the French Navy as a midshipman, serving under his elder brother Pierre Le Moyne d'Iberville in King William's War (War of the League of Augsburg, 1689–1697) and taking part in expeditions commanded by d'Iberville against the English in Hudson Bay, Newfoundland, and off New England. Bienville was severely wounded in 1697. At the end of the war, both brothers sailed for France.

Jean-Baptiste Le Moyne de Bienville, governor of Louisiana and founder of the city of New Orleans. (Library of Congress)

Having distinguished himself in the war, d'Iberville took command of an expedition to search for the mouth of the Mississippi River, and Bienville accompanied him. The expedition departed Brest, France, in October 1698, and on March 2, 1699, located the mouth of the Mississippi. Members of the expedition were the first Europeans to enter the river from the Gulf of Mexico.

D'Iberville established Fort Maurepas at Biloxi (now within Ocean Springs, Mississippi). In May 1699, he returned to France, leaving 70 men with Lieutenant Jean de Sauvole in command. Sauvole died in August 1701 and, at age 21, Bienville took charge, in effect, of all Louisiana. In 1702, d'Iberville returned for four months, confirming his brother in that position. D'Iberville then departed. He died in 1706 while leading a French expedition to the West Indies during Queen Anne's War (1702–1713).

In 1702, meanwhile, Bienville transferred his headquarters to Fort Louis on the Mobile River. In 1711, severe flooding forced him to relocate about 25 miles downriver to present-day Mobile, Alabama. Following the decade of war, the French settlement in Louisiana was in desperate straits. Because of his knowledge of the Native Americans, Bienville was a principal factor in the colony's survival; nonetheless, many settlers blamed him for their plight.

Concerned about Bienville's youth, in 1707 the Crown passed him over and appointed Nicolas Daneau de Muy as governor. Fellow Frenchmen also intrigued against Bienville, charging him with authoritarianism, religious favoritism, cruelty against Native Americans, and an affair with an unmarried woman. Subsequently investigated by a crown agent, these charges were never proven. Nonetheless, Bienville went for years without a salary.

Muy died en route to Louisiana, and the Crown then appointed Antoine de La Mothe, Sieur de Cadillac, as governor of the Louisiana colony. Named to the post in May 1710, he traveled to Louisiana by way of Canada and did not arrive until June 1712. Cadillac pursued the investigation of Bienville, again without result but alienating Bienville, who served as the king's lieutenant or second-incommand of the colony, in the process.

In 1714, the Ministry of the Marine gave Bienville military command of the Mississippi River from the Ohio to the Gulf of Mexico. Cadillac proved hopelessly inept in dealing with the Native Americans and was obliged to recall Bienville to repair relations with them. Bienville's success only further alienated Cadillac, who then ordered Bienville and 34 men to deal with the Natchez's 800 warriors, several of whom had murdered 4 Frenchmen. Recruiting additional manpower, Bienville moved into Natchez territory and succeeded by ruse and hostages to get the Natchez chiefs to execute the 6 murderers. Bienville then secured the assistance of the Natchez in the construction of Fort Rosalie (present-day Natchez, Mississippi).

Convinced that Cadillac was incompetent, the home government at length recalled him but again passed over Bienville in naming as governor Jean-Michel de Lespinay. During October 1716–March 1717, until his arrival, Bienville was acting governor. In September 1717, King Louis XV named him a knight of the order of Saint Louis.

In 1717, the Crown entrusted Louisiana to Scottish financier John Law's Compagnie d'Occident, soon known as the Compagnie des Indes. This ended the position of governor, and Bienville became commandant general. The Crown added the Illinois Country to Louisiana, and it thus came under Bienville's military jurisdiction.

In 1718, Bienville was charged with establishing a company post at a site of his choosing between the Mississippi River and Lake Pontchartrain, to be known as Nouvelle Orléans (New Orleans). Bienville wanted it to be a seaport and selected a portage between the river and Lake Pontchartrain. Toward that end he oversaw construction of levees, dredging silt, and digging a canal between the river and Lake Pontchartrain.

Bienville pursued a correct attitude toward the Spanish authorities in the region, but he also fortified Natchitoches, thereby establishing the eastern line of Texas. In 1719 when war broke out between Spain and France, Bienville learned of it before the Spanish and seized Pensacola. Following its subsequent loss to the Spanish, he retook it.

The collapse of Law's Mississippi scheme led to a reorganization of the Compagnie des Indes, which retained Bienville as its commandant general. In 1725, however, the directors, believing him not to be of sufficient nobility, recalled Bienville to France for "consultation" and replaced him with Étienne de Périer. It appeared as if Bienville would not return to Louisiana, but in November 1729 the commandant at Fort Rosalie provoked the Natzhez into revolt. The Native Americans killed or captured hundreds of French colonists.

The Natchez finally capitulated in January 1731, but this episode led the company to ask the king to resume the government of Louisiana. In the summer of 1732 King Louis XV named Bienville governor. He returned there in March 1733 and remained a decade.

During the period of his governorship, Bienville dealt principally with trade (both legal and contraband), encouraging export crops, the importation of African slaves, land grants for former soldiers, and pressing budgetary matters. He established excellent relations with Native Americans in the region and pleased them by learning their languages. Throughout his governorship, Bienville supported the Choctaws against their adversaries the Chickasaws, who had the support of the English. Bienville's elaborate efforts to defeat the Chickasaws in a series of military campaigns from 1736 to 1739 finally met with success. Following the dispatch of men and artillery from France, the Chickasaws agreed to negotiations and pledged to the French their cooperation.

In 1741 Bienville asked to be relieved from his post for health reasons. He departed for France in August 1743, following the arrival of his successor, Pierre de Rigaud de Vaudreuil. Bienville died in Paris on March 7, 1767.

Le Moyne d'Iberville et d'Ardillières, Pierre

Born: July 16, 1661 Died: July 9, 1706

French colonial military and naval leader, identified by some historians as the first true Canadian military hero. Pierre Le Moyne d'Iberville was born at Ville-Marie (Montreal) on July 16, 1661, the third son of Charles Le Moyne de Longueuil et de Chateauguay, one of New France's most influential seigneurs and merchants. Several of d'Iberville's brothers, notably Jean-Baptiste Le Moyne de Bienville, enjoyed distinguished military careers.

D'Iberville first distinguished himself in 1686 by playing a central role in Pierre de Troyes's successful expedition against the English fur traders at James Bay (near Hudson Bay). During King William's War (1689–1897), d'Iberville personally commanded expeditions to the bay in 1688–1689, 1690–1691, 1694, and 1697,

French colonial military and naval leader Pierre Le Moyne d'Iberville helped preserve New France in its wars with England in the late 17th and early 18th centuries and was perhaps Canada's first military hero. (North Wind Picture Archives)

raiding English posts and seizing furs. Concurrently, he took part in the attack on Schenectady, New York, in February 1690, worked as a privateer off the New England coast, and escorted convoys between France and North America.

In 1696, d'Iberville orchestrated a campaign against the English settlements and fisheries in the northwestern Atlantic. After capturing and destroying Fort William Henry (Maine) in August of that year, he led a brutal but successful winter land campaign in Newfoundland. By the end of March 1697, only Bonavista and Carbonear remained in English hands.

On the conclusion of the Peace of Ryswick in 1697, the French minister of marine chose d'Iberville to lead an expedition to the mouth of the Mississippi River. The objective was to build a fort that would block other European nations from access to the river. D'Iberville's 1698–1699 voyage accordingly resulted in the foundation of the first permanent European settlement in Louisiana, Fort Maurepas (near modern-day Ocean Springs, Mississippi). On his return to France, he was awarded the Cross of Saint Louis, becoming the first native Canadian to receive this coveted military distinction. During two subsequent expeditions to Louisiana, in 1699–1700 and 1701–1702, d'Iberville negotiated alliances with the local indigenous peoples and oversaw the construction of Fort Mississippi and Fort St. Louis. All the while, he continued trading in furs.

During Queen Anne's War (1702–1713) and despite his declining health, in 1705 d'Iberville was entrusted with the organization of a privateering expedition to the West Indies. Leaving France in the

early spring of 1706 at the head of a squadron of 12 ships, he proceeded to sack the English island of Nevis in April. This last campaign was his most controversial. Following his sudden death (likely due to yellow fever) on July 9, 1706, and his burial in Havana, d'Iberville was found guilty of various charges, including clandestine trading with the enemy and evading royal taxes on spoils of war. As a result, French authorities seized most of his estate as reparations.

Lenni Lenape

See Delawares (Lenni Lenape)

Lévis, François Gaston de, Duc de Lévis

Born: August 23, 1720 Died: November 26, 1787

General in the French Army. François Gaston de Lévis was born into an old aristocratic family in Languedoc, France, on August 23, 1720. His father, Jean de Lévis, encouraged him to join the army in 1735, and the younger Lévis enjoyed a successful military career in his youth. Lévis fought in the War of the Austrian Succession (1740–1748).

As a brigadier general during the French and Indian War (1754–1763), Lévis was ordered to Canada in 1756 as second-incommand to Major General Louis-Joseph, Marquis de Montcalm. Lévis arrived in Quebec in May 1756. The next month he was sent to Montreal. Lévis went on to lead French troops at the Battle of Fort Carillon (Ticonderoga) on July 7–8, 1756. He also fought at the Battle of Montmorency on July 31, 1759, where British forces were repelled and Quebec, the lynchpin of New France, continued under French control. However, the British, led by Brigadier General James Wolfe, launched a successful attack on Quebec later in 1759.

Lévis was in Montreal during the siege of Quebec (June 27–September 11, 1759). After Montcalm died in battle on the Plains of Abraham defending Quebec, Lévis assumed command of French troops in North America. Lévis was a careful planner and a bold and innovative commander. In an attempt to retake Quebec, on April 26, 1760, Lévis led a surprise attack by 7,000 French troops against

444 Light Infantry

Lieutenant Colonel James Murray's British forces at Sainte Foy outside the city. Fought in deep snow and bitter cold, the battle resulted in more than 1,000 deaths on each side. Although the British forces were defeated in this battle, they were able to withdraw into Quebec. When a British fleet arrived in May 1760, Lévis abandoned his siege of Quebec, assuring the British of victory in the French and Indian War.

Lévis returned to France after the French surrendered Montreal to the British on September 8, 1760. Continuing his military career, he was promoted to lieutenant general in 1761. After service in the Seven Years' War in Europe, he left active military service. He was appointed governor of Artois in 1763 and made a marquis. He was named marshal of France in June 1783. During the remaining years of his life, Lévis openly expressed the view that apathy, arrogance, and extravagance on the part of the French nobility would lead to revolution. Lévis died in Arras on November 26, 1787, less than two years before the beginning of the French Revolution of 1789.

Light Infantry

Light infantry were highly mobile infantry units, usually formed of the best trained and most reliable men for special, demanding duties. The development of light infantry companies and battalions occurred first in southeastern Europe. They were introduced into the armies of Western Europe at the end of the 17th century. By the mid-18th century, all the major European armies had units of light infantry, patterned after the *jägers* of the German state of Hesse. During 1741–1742, elite companies of light infantry became a regular element in the British Army.

The British discovered the great utility of light infantry in the wilds of North America during the French and Indian War (1754–1763). The defeat of British major general Edward Braddock's column near the Monongahela River in 1755 awoke British officers to the need to have forces available to counter the French and their Native American allies. The 60th Regiment of Foot (Royal Americans) was one of the first units created to counter the French edge in woodland fighting. This regiment had several battalions trained as marksmen, and soldiers had to qualify to serve in these units. In 1757, Colonel Thomas Gage suggested the formation of the first independent light infantry regiment. By 1758, British line regiments had at least one light infantry company paired with the regiments

imental grenadier company. Both companies would be known as "flank companies," and they would be stationed on the left and right of the regimental or battalion line of battle. These light companies could be pulled together to form battalion-level light infantry formation for various specialized operations. In 1763, one such formation was created with light infantry companies from several regiments to counter Pontiac's Rebellion.

The British light infantry or "light bobs" wore a uniform modified for forest service. It consisted of short jackets with or without sleeves. Headgear was either a skullcap with crest or slouch hat for field service. Field kit was reduced to allow rapid movement in the woods. Many regular officers looked down on these "light bobs" for their appearance and their use of open order formations in combat. The colonial American counterparts to light infantry units in the British Army were the ranger units raised to operate against hostile Native Americans. The British use of light infantry waned after the French and Indian War, but the American Revolutionary War brought about the creation of light infantry companies and the hiring of German jäger companies.

Litchfield Forts (Connecticut)

Series of five forts built between 1720 and 1725 in and around Litchfield, in northwestern Connecticut, in reaction to ongoing hostilities between Abenaki Native Americans in Maine and Massachusetts settlers. Dummer's War (1722–1727) resulted in open warfare between Massachusetts colonists and the Abenakis, which included frequent Abenaki raids on English settlements. Areas under the greatest pressure were Massachusetts (including Maine) and New Hampshire.

Colonists in Connecticut worried that the war might include them as well. They also worried that local natives would join the fray and attack Connecticut towns. Litchfield, incorporated in 1718, was a frontier town at the time and defending it was crucial. Local officials built the first of the Litchfield forts in 1720, on the site of the present courthouse. In August 1723, native attacks did occur in the area and a Litchfield settler was killed. The town's leaders then decided to build four additional forts, all constructed that same year. Fort Kilbourn (or North Fort) was located on present-day Fern Road north of the settlement. Fort Bird (or South Fort) was likely located in the town of Morris, just south of Litchfield. Fort Griswold (also known as West Fort) was probably located on Harris Plains, west of Litchfield. Fort Culver (East Fort) was erected on Chestnut Hill.

Little Fort Niagara (New York)

Fort constructed by the French in 1750 as a trading post and frontier barracks along the Niagara River, directly above the falls where the Cayuga Creek flows into the Niagara. Little Fort Niagara, or Fort du Portage, was built by Daniel Marie Chabert de Joncaire de Clausonne, who served as an interpreter and representative to the Senecas for the New France government.

In 1745, Chabert erected a small blockhouse at a location known as "Frenchman's Landing." There he was able to make the portage profitable for himself, the French government, and Native Americans. The original blockhouse served as an important trading post, one convenient for carrying canoes and goods above Niagara Falls.

In 1750, the upper end of the portage was moved a few hundred yards to the south as part of the fort's construction. The fort was a stockade with a two-story barracks, along with storehouses, stables, and blockhouses. The barracks had a large, 60-ton stone chimney with a fireplace for each floor. The first floor of the barracks had a mess room and kitchen. Sleeping quarters for troops were on the upper floor. A palisade stood between the blockhouses and the river.

In late 1754, the British sought to remove the French from Acadia, Niagara, Crown Point, and the Ohio River Valley. The ensuing conflict with the French and their native allies witnessed some early defeats for the British. In 1758, London reorganized its forces and sent substantial reinforcements to North America. Major General Jeffery Amherst assumed command, and in the summer of 1759 he ordered an attack on Niagara to cut off French access to western New York.

During the first week of July 1759, British forces approached Little Fort Niagara from the west, along the south shore of Lake Ontario. On July 8, Chabert and his men, fearing capture by the British, set fire to the fort, the barracks, and sawmill by the rapids. They then fled to Fort Niagara (Old Fort Niagara) and, ultimately, to Canada on the fall of the larger fort later that month. The only part of Little Fort Niagara left standing was its large stone chimney.

In 1760, the British rebuilt the fort and named it Fort Schlosser. It was reconstructed just east of the original site, and the surviving barracks chimney from the French fort was incorporated into the new fort's mess hall. The British erected a two-story house with a one and one half-story addition to the chimney. The rebuilt fort was a square earthwork with four bastions. At the conclusion of the French and Indian War, the British took control of the land from the Senecas on both sides of the Niagara River.

Although territorial rights in the northwest and Great Lakes were often sources of friction between the new American nation and Great Britain, the United States took control of the fort in 1796. The Americans used it primarily as a depot. During the War of 1812, the British completely burned the fort. All that remains today is the "Old Stone Chimney."

Logan, John (Tachnedorus)

Born: ca. 1725 Died: 1780

Mingo leader. Born around 1725 and also known as Chief Logan, the Mingo Chief, and Tachnedorus, John Logan resided in the West Virginia and Kentucky region during the Revolutionary period. He was named after the secretary of the colony of Pennsylvania. Logan befriended many of the local white settlers in his role as tribal leader. He had a reputation as a bridge builder between Native Americans and English colonists.

In 1774, the continuing sporadic violence between natives and settlers on the frontier led a group of settlers under Colonel Michael Cresap and Dan Grealborne to murder two of Logan's family members. This action helped trigger Lord Dunmore's War. Logan responded by leading attacks against English settlements in the Monongahela River Valley, killing hundreds of settlers there. Colonial officials reacted by opening a campaign against the attacking natives. Logan then decided to seal an alliance with Shawnee tribal leader Cornstalk.

At the Battle of Point Pleasant on October 10, 1774, the more numerous colonials defeated Cornstalk and Logan and their warriors. As a result, Cornstalk was forced to surrender all of his tribal land claims in Kentucky. Logan, however, refused to surrender. Over the next few months, he raided settlements in both British and

Native American territories. During the fighting, he gave a speech in which he declared that the authorities would never catch him. Continuing his attacks on local settlements, Logan died at an unknown location in 1780.

Logistics

Logistics embrace the procurement, transportation, and maintenance of military supplies and personnel. Essential supplies required for warfare in the colonial period included clothing, weapons, food, cooking utensils, tents and bedding, equipment and supplies, wagons, boats, and specie to pay for the troops, services, and shelter. Without proper logistics support, fighting forces could not take the field nor remain in it for any extended period. Effective logistical support was not only necessary in the conduct of a war but an important factor in maintaining high morale among the fighting men.

From the initial Spanish landing in the Americas to the American Revolutionary War, the European colonists experienced con-

flicts both with Native Americans and with the colonists of other imperial nations. Although the natives were accustomed to the land and its resources and were able to make their own primitive weapons and live off the land, the Europeans found it much more difficult to wage war in the new environment. Logistics support became extremely important to them.

At first, the colonists' chief concern was defense of their coastal communities from native attacks. This limited the need for logistics support because the colonists were stationary and their supply stores were readily accessible. Beginning in the late 17th century, however, logistics became more complicated as the colonists sought to expand their holdings and they and regular military forces took the offensive against the Native Americans and against the colonies of other European powers.

To attack the native villages at some distance from their own settlements, the colonists needed to develop sustained logistics support. At first, with campaigns only a few days' duration and distances relatively short, militiamen called up for service were expected to provide their own food, weapons, and ammunition.

In larger, more sustained operations, the colonial governments got involved, although there were no regular quartermaster services. Salt beef, pork, and fish might be stored in barrels. Drink, including rum, wine, brandy, and water if necessary might be transported in barrels, although generally the men could rely on water from local wells and springs.

Adequate clothing was essential, especially in winter campaigns. The basics included leather shoes, woolen stockings, leather or wool pants, shirts, jackets, and hats. During the winter, the men also wore overcoats, mittens or gloves, and scarves. Save in the largest campaigns, the army did not provide tents. The men were expected to do the best they could with whatever the area provided. Soldiers might construct lean-to shelters of brush and leaves while sleeping on the ground with their knapsacks as a pillow. Regular troops generally required tents, which they erected each night.

Weapons carried included swords and hatchets, knives, flint-lock muskets, and pistols. Other important accessories included bandoleer or cartridge belts, bullet pouches, and powder horns and bullets, as well as lead and casting molds to produce bullets. Since firearms in the colonial period varied widely in caliber, each militiaman cast his own bullets. In larger, prolonged campaigns, the colonial government might provide cannon or mortars and the shot and powder for them. Larger, sustained operations would also necessitate the government making arrangements for the transport of additional lead to make bullets and powder.

Other supplies necessary for a campaign might include building and medical supplies. Militia and regular forces might bring with them axes, shovels, and other tools necessary to clear paths through the woods or to construct bridges to cross streams and swamps necessary for the transport of artillery. They also might require tools and supplies such as nails to construct fortifications and buildings. Cooking equipment, medical supplies, and surgical tools were also a standard part of larger operations. Such tools and building supplies might

be transported overland in carts or wagons drawn by oxen or horses or transported over water in canoes, boats, or bateaux.

As forces became larger and better organized at the end of the colonial period, specialized officers known as commissaries or quartermasters supervised the gathering of supplies and their transport during a campaign. Armies also relied on civilian contractors, although this was usually attended by some degree of price gouging and graft.

Logstown, Treaty of Event Date: June 13, 1752

Agreement among representatives of several Native American tribes, the Ohio Company, and officials from Pennsylvania and Virginia chiefly regarding land rights in the trans-Allegheny region, signed on June 13, 1752. The treaty was signed after negotiations had taken place at Logstown, a Native American settlement some 18 miles south of modern-day Pittsburgh, Pennsylvania. Ultimately, the Treaty of Logstown would aggravate the conflicting interests of the Iroquois Confederation, New France, Virginia, and English land speculators in the Ohio River Valley. This helped contribute to the outbreak of the French and Indian War (1754–1763).

Immediately following the Iroquois cession of all land claims in western Maryland and Virginia in the Treaty of Lancaster (1744), the Virginia House of Burgesses moved to assert its claim over the entire Ohio Country. In 1745, it granted nearly a third of a million acres of land to the Ohio Company of Virginia. The Company sought to sell lands around the Fork of the Ohio River (present-day Pittsburgh) to promote trans-Allegheny settlement and trade. King George's War (1744–1748) delayed these plans. However, by the early 1750s the Ohio Company had established a fortified storehouse at the confluence of Wills Creek and the northern branch of the Potomac River (present-day Cumberland, Maryland). It also planned to survey the Ohio Valley and sell land and manufactured goods to settlers there.

In June 1752, Christopher Gist, the leader of the survey, and George Croghan, a Pennsylvania trader who had established a large

trading post at Pickawillany, convened a treaty conference at Logstown. Their goal was to convince the Iroquois, the Shawnees, and the Delawares to support the Ohio Company's goals. Also in attendance were commissioners from Virginia and Pennsylvania, whose interests generally intersected with those of the Ohio Company's. Gist and Croghan sought Native American consent to the construction of a company-owned fortified storehouse at the confluence of the Allegheny River and the Monongahela River. They promised that the storehouse would offer Native Americans favorable trade rules. Actually, however, it would give the company control over a strategic point in the Ohio Valley that would promote trans-Allegheny settlement and trade. Influenced by a mountain of gifts, assurances of goodwill, and concern over recent French efforts to reassert former claims in the Ohio Valley (Céleron de Blainville's expedition), Tanaghrisson, the spokesman for the Iroquois Confederation, accepted Gist and Croghan's proposal. In doing so, he acknowledged Virginia's claim to all territory in the valley south of the Ohio River.

On learning of the treaty, the French destroyed the English trading post at Pickawillany on June 21, 1752, killing a number of people. They also fortified their trading posts in the Ohio Valley and erected forts at Presque Isle, Le Boeuf, and Venango in northwestern Pennsylvania. Virginia's efforts to repel French encroachments in the region, including Lieutenant Colonel George Washington's 1754 campaign and Major General Edward Braddock's ill-fated 1755 campaign, marked the opening volleys of the French and Indian War.

Long Island

Island located in the southeastern corner of New York, just east of Manhattan, encompassing 1,401 square miles. Long Island is 118 miles long and about 20 miles in width at its widest point. The island is separated from Manhattan by the East River, from Connecticut by the Long Island Sound, and bordered on the south by the Atlantic Ocean. Present-day Queens and Brooklyn comprise the

Woodcut of the Brooklyn Ferry across the East River from New York to Long Island, ca. early 1700s. (North Wind Picture Archives)

westernmost part of the island, part of New York City since 1898. Nassau and Suffolk Counties make up the rest of present-day Long Island

Long Island has a rich history of Native American settlement dating back thousands of years, and European settlement going back to the early 17th century. In 1614, Adrien Block sailed the Long Island Sound and described the shape of the island. With the settlement of New Amsterdam in the 1620s, competition between the Dutch and the English for control of Long Island became more intense.

In 1635, the Earl of Stirling had a grant from Britain's King Charles I for all of Long Island. His agent, James Farrett, issued patents for various tracts of land including Oyster Bay. Present-day Suffolk County (on eastern Long Island) was mainly comprised of English settlements. By 1638, the English held Shelter Island, off the eastern end of the north fork of Long Island. Lion Gardiner settled Gardiner's Island in 1639, and Southold and Southampton were settled by the English in 1640.

The western end of the island was predominantly Dutch. Numerous Dutch villages were settled in present-day Brooklyn and Queens, including Mespat (Maspeth) in 1642, Boswijck (Bushwick) in 1638, New Utrecht in 1657, Rustdorp (Jamaica) in 1650, Midwout (later Flatbush) in 1634, and Vlissingen (Flushing) in 1643. Lady Deborah Moody arrived in New Amsterdam by way of Massachusetts in 1643, accompanied by 40 colonists. Gov. Willem Kieft

granted her land in present-day Brooklyn, where she founded a settlement known as Gravesend.

The Dutch and the English did coexist in several villages, including Jamaica and Hempstead, and tension between the Dutch and the English on Long Island did not escalate to military action. In 1650, the Dutch and the English signed the Treaty of Hartford, which ceded western Long Island to the Dutch and eastern Long Island to the English.

During Kieft's War, Native Americans wiped out Maspeth. Other settlements, however, survived the war. Indeed, the center of Lady Moody's Gravesend was protected against natives attacks by a log stockade. Kieft's War not withstanding, most Long Island Native Americans were peaceful. Nonetheless, caution ruled even after Kieft was recalled to Holland. The Dutch had purchased Flatbush from the Canarsie tribe, but in 1654 the Rockaway tribe claimed that the land was not theirs to sell. They promptly demanded payment. The Dutch West India Company agreed to the reimbursement to avoid attack. During the mid-1650s, the Dutch built a stockade around the newly constructed church in Flatbush. When the British sailed into New Amsterdam in 1664, Gov. Petrus Stuyvesant surrendered rather than fight. New Netherland, including all of Long Island, was ceded to the English.

By the turn of the 18th century, other European threats in the immediate area had been vanquished. The French and Indian War

(1754–1763) did not directly affect Long Island. By that time, native threats were minimal, and settlements across the island prospered.

Lord Dunmore's War

Start Date: April 1774 End Date: October 19, 1774

Conflict that erupted in April 1774 when bands of frontiersmen attacked Native American settlements in the Ohio River Valley. Subsequent retaliatory raids by the natives prompted John Murray, Fourth Earl of Dunmore and Virginia's governor since 1771, to send 2,000 men into the district he named West Augusta. By month's end Lord Dunmore announced that Fort Pitt (Pennsylvania) was in imminent danger. Pennsylvanians and Virginians, particularly land speculators associated with the Loyal Company, proceeded to manipulate the evolving frontier dispute as a means of subverting the hated Proclamation Line of 1763. The proclamation had been the Crown's attempt to maintain peaceful relations with potentially rebellious western natives by prohibiting settlement west of the Appalachians.

Tensions between the Shawnees and the English colonists first surfaced when Sir William Johnson, British superintendent of Indian Affairs for the northern colonies, and Iroquois emissaries fixed the northern boundary line, originally expressed in the Proclamation of 1763, with the Treaty of Fort Stanwix in 1768. Native American communities in the upper Ohio Valley—particularly the Miamis, the Shawnees, the Wyandots, the Delawares, and the Mingos—rejected the right of the Iroquois to cede all of their hunting grounds south of the Ohio as far as the mouth of the Tennessee River. The tributary nations argued that their dependency was based on a compact of mutual responsibilities that did not involve the unilateral surrender of their land rights.

When Daniel Boone and other American colonists claimed the ceded territory in Kentucky, angry Shawnees and Wyandots sought to turn back the encroachers. By 1771, Delaware, Mingo, Miami, Ottawa, and Illinois leaders helped fashion an allied confederacy to repulse the English invaders. As a result, Lord Dunmore's War

began with a series of atrocities committed against unsuspecting Native American settlements. Yet as throngs of pioneers prepared to cross the Appalachians, one Shawnee leader, Cornstalk, advocated peaceful restraint.

In 1774, on learning that hostile Shawnees were ravaging the frontier settlements, Dunmore rallied Virginia's militia. A short time later Dunmore sent 2,000 militiamen into Shawnee territory. Instead of chastising the rebellious tribes, the violent raids, especially the murderous exploits of Captain Michael Cresap, only created greater hostility. Enraged Shawnee warriors, accompanied by some Mingos, swarmed the exposed western settlements in revenge.

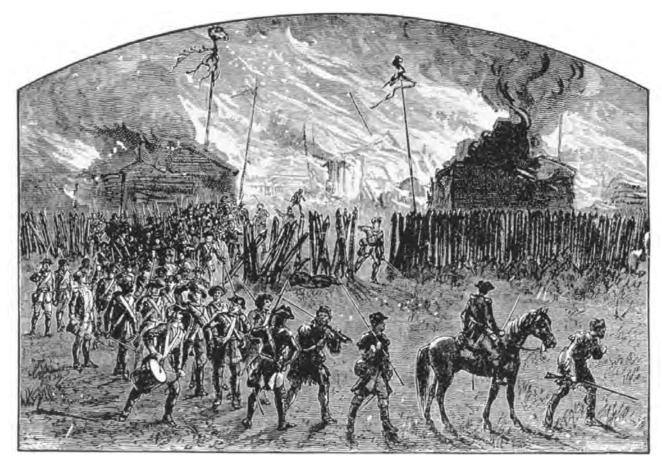

When frontier clashes first erupted in the spring of 1774 John Logan, a Mingo chief, admitted that the Ohio tribes had just grounds for complaint. Unlike other native leaders who favored a more militant course of action, Logan reminded Mingo warriors of their own transgressions during council deliberations. After the tribal council ended, however, messengers arrived in early May 1774 with tales of more atrocities, including the ambush and murder on April 30 of 11 Mingos, including 2 of the chief's relatives. Mingo and Shawnee warriors responded to the reports by increasing their raids against English settlements along the west bank of the Monongahela River.

Eager to subdue the hostiles, Dunmore promptly dispatched two militia columns into the Ohio Valley. He also ordered the men to build a stronghold at Wheeling (Fort Wincastle) and to destroy neighboring Shawnee villages. Angus McDonald's subsequent expedition destroyed five Shawnee villages. Although successful, the Wapatomica campaign inspired Shawnee and Mingo warriors to seek revenge against the isolated frontier communities.

On July 12, 1774, Dunmore instructed Colonel Andrew Lewis, commander of the southwestern militia, to proceed from Camp Union (modern Lewisburg, West Virginia) directly to the mouth of the Kanawha River where Dunmore's army would join him from Fort Pitt. Lewis and his 1,100 militiamen arrived on October 6, 1774, and camped at Point Pleasant, a triangle of land at the confluence of the Kanawha River and the Ohio River. Messengers later informed Lewis that Dunmore had altered his plans. Instead of joining Lewis at Point Pleasant, Dunmore now wanted Lewis to join him in attacks against Shawnee villages along the Scioto River. Shawnee scouts, however, spotted the invaders before they had time to depart and rushed home to prepare for an assault. Although the warriors wanted to strike the first blow, Shawnee leader Cornstalk counseled peace. After rejecting Cornstalk's pleas for negotiation, the tribal council voted to strike Lewis's force at dawn.

Cornstalk demonstrated his acceptance of the council's decision by leading some 1,000 Shawnee, Mingo, Delaware, Wyandot, and Ottawa warriors against the unsuspecting Point Pleasant encampment. The Battle of Point Pleasant began on October 10, 1774. The natives fought hard, but the attackers were eventually scattered after a day of bloody combat.

After their defeat at the Battle of Point Pleasant, the natives fled through the forest to their towns on Pickaway Plains. After warriors had reassembled in council, Cornstalk upbraided the other chiefs

Virginia militiamen shown burning a Native American village during Lord Dunmore's War in 1774. The conflict was sparked by settler dissatisfaction with the Proclamation Line of 1763. (North Wind Picture Archives)

for their refusal to let him negotiate a settlement. No one moved to answer Cornstalk's questions about how to stop the advancing enemy. Thus, a furious Cornstalk rose and struck his tomahawk in a post in the council house and offered to make peace. The humbled warriors concurred and Cornstalk assembled a Shawnee delegation to accompany him.

After venting his frustrations, Cornstalk set out for Camp Charlotte, Dunmore's headquarters. Dunmore received Cornstalk's peace overture and agreed to hold a conference. During the ensuing treaty negotiations, Cornstalk described the innumerable wrongs that his people had suffered before the outbreak of hostilities. A chastised delegation later dejectedly agreed to the peace terms offered at the Treaty of Camp Charlotte. According to the provisions of capitulation on October 19, 1774, members of the Shawnee delegation pledged to surrender all prisoners and valuables; to deliver hostages as a guarantee of friendship; to never again attack the frontiers; and to surrender all claims to lands south and east of the Ohio River. The Mingos, however, refused to come to terms with the Virginians. The recalcitrant Iroquoian band accepted the capitulation only after Major William Crawford's frontiersmen destroyed several of their towns. Terms of the treaty were later confirmed at Pittsburgh in the fall of 1775 when Mingo,

Shawnee, Delaware, Wyandot, Iroquois, and Ottawa chiefs ratified and confirmed Dunmore's original peace terms.

After the war, resentful Native Americans realized that the westward-moving American colonists, called the "Long Knives," would continue to invade their cherished homelands. In June 1774, Parliament passed the Quebec Act. The new legislation temporarily restrained land-hungry settlers by extending Quebec's boundaries to the Ohio Valley, thereby nullifying land seizures made by Virginia during Lord Dunmore's War. American colonists, especially veterans of the French and Indian War and those with designs on the western territories, derided the legislation. Not surprisingly, restless colonists and land speculators openly violated another of Britain's feeble attempts to restore order along the frontier.

Lord Dunmore's War and the subsequent flood of colonial encroachers into the western territories represented the failure of the British Crown to live up to the goals enunciated in the Proclamation of 1763 and the Quebec Act of 1774. Despite repeated orders to treat American Indians with justice, colonial governors and royal officials failed to enforce existing laws. As a result, angry warriors patiently waited and waited for the right opportunity to secure the return of their ancestral lands.

See Campbell, John, Lord Loudoun

Louisbourg (Nova Scotia)

French settlement and fortification located on the easternmost part of Cape Breton Island. Louisbourg was first settled in 1713. In 1717, the French established Fort Louisbourg to defend the Atlantic's cod fishing banks and to protect Louisbourg's ice-free port. It also served to guard the entrance to the St. Lawrence River.

To the British, the presence of a significant, nearby French military garrison, privateers, the ongoing French-Micmac alliance, and the port's economic success all made Louisbourg a significant threat to the English colonies. Thus the British established their own citadel at Halifax in 1749.

After the 1713 Treaty of Utrecht ceded mainland Nova Scotia and Newfoundland to Britain, the French shifted their Atlantic focus to Île Royale. Initially, the French simply relocated fishermen from Placentia and Nova Scotia to reestablish the cod fishery. When the decision came to erect a fortification, the harbors at Louisbourg, Port Toulouse (St. Peters), and Port Dauphin (Englishtown) all were actively considered. At first, in 1715, Port Dauphin was chosen as the site. But after reconsidering its options, the Ministry of the Marine decided on Louisbourg based on its strategic location and better potential for commerce.

In 1717, the French began constructing a fortified town and port at Louisbourg to defend their maritime interests. From 1717 to its final capture by the British in 1758, the French constructed a series of bastioned walls and detached batteries at Louisbourg. The fortress was constructed in the "Vauban style," with military engineers superimposing a star-shaped geometric fortress on an Acadian fishing village. French military engineer Jean-François de Verville received the task of overseeing construction of the fortress. His plan, which underwent later modification, was to design a fortress that could withstand a two-month siege. In practice, however, the fortress proved difficult to defend.

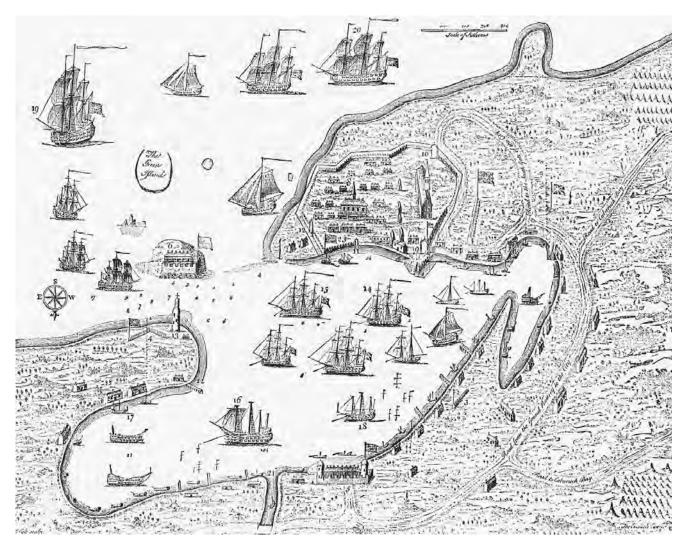

Verville imposed his plan on the earlier Acadian settlement and warehouse locations. Despite the increased symmetry of the defenses, several clusters of warehouses and a few houses did not fit into the grid system. Aside from civilian homes and warehouses, the military buildings consisted of six bastions, a hospital, barracks, governor's house, guard house, and powder magazine. The barracks buildings were more than 300 feet long and approximately 55 feet wide. Its spire, along with that of the hospital, dominated all representations of the fortress and town. Just before the first siege in 1745, Louisbourg finally had become the *ville fortifiée* (fortified town) envisioned in 1717.

Civilian contractors built the fortifications at Louisbourg. Construction problems plagued the operation, however. The lime mortar was of poor quality because sea salt in the local sand prevented it from setting properly. The climate further weakened the mortar, which required continual repairs. In an effort to stem the fort's deterioration, the mortar was recapped, boards nailed to it, and large metal staples were used to hold stones in place. France spent approximately 4 million livres on the fortifications and another 16 million on other public works between 1713 and 1758. Designed to withstand a naval bombardment, Louisbourg remained vulnerable to siege and landward attack despite attempts to rectify this deficiency after 1749.

Despite the size of the barracks, the amount of goods passing through the town, and the importance of the fortress, troops garrisoned at Louisbourg mutinied in December 1744. Local authorities quickly met the demands of the mutineers and provided better food, compensation for unfair wage deductions, and an amnesty. When Louisbourg surrendered to the English six months later and the garrison returned to France, some of the mutineers were hanged and others were less severely punished. After 1749 the Ministry of the Marine tried to correct the abuses that had led to the revolt.

English forces twice besieged and captured Louisbourg. In 1745, during King George's War (1744–1748), it fell to 4,000 New England troops but was returned to France by the Treaty of Aix-la-Chapelle. Before the siege, the garrison made up about a quarter of the population living within the walls. After the French garrison returned in 1749, its strength was gradually increased to 3,000 troops. A large number of civilians also lived within the fortress.

In 1758, during the French and Indian War (1754–1763), the fort again fell, this time to 13,000 British and provisional troops,

Woodcut of the New England military operation against the French fortress of Louisbourg on Cape Breton Island in 1745. (North Wind Picture Archives)

supported by 14,000 naval personnel. The British occupied Louisbourg until 1768, at which time they destroyed the fortifications and abandoned the site. The reconstructed Fortress Louisbourg is now a Canadian National Historic site.

Louisbourg, Siege of

Start Date: June 8, 1758 End Date: July 26, 1758

The British siege and capture of the French fortress at Louisbourg during June–July 1758, one of the most important battles of the French and Indian War (1754–1763). The seige set the stage for subsequent British operations against Quebec.

The fortified town of Louisbourg was located on the east coast of Cape Breton Island. It commanded a large harbor some three miles long and about half a mile wide. The channel providing access

to the harbor was only about half a mile wide and was flanked by rocky shoals. Louisbourg was often called the "Gibraltar of the New World" because of this imposing Vaubanesque fortress's stone walls and ample cannon, but in fact it depended heavily on naval support for its defense. Indeed, it was begun as an anchorage for the French Navy to help defend the Gulf of St. Lawrence.

This was not the first time the British had assaulted the French stronghold. In 1745, during King George's War (1744–1748), New England militia, supported by a strong British Navy squadron, had shocked London and Paris by capturing the fortress. The October 1748 Treaty of Aix-la-Chapelle ending the war returned Louisbourg to French control, however, enraging New England.

When warfare began anew in 1754 between the French and English in North America, it was clear to both sides that control of Louisbourg would be vital to the outcome. In French hands, Louisbourg served as a base from which attacks could be mounted against New England and Nova Scotia. It was also a haven for French privateers attacking English fishing boats and merchant ships plying the principal North Atlantic sea lanes between North America and Britain, as well as a center for illicit trade between the French and New England. If the British were to gain control of Louisbourg, they could turn it into a powerful base from which they might close off the St. Lawrence to French resupply and establish an assembly point there for an invasion up the St. Lawrence to Quebec. They would also control the Atlantic fisheries.

In 1757, Prime Minister William Pitt made it clear that he intended to emphasize the North American theater of war with the ultimate goal of ending French rule there. The capture of Louisbourg would be the essential first step in moving against the heart of New France at Quebec. Pitt's overall strategy for victory was the same one that had been in place for some time. It called for a three-pronged attack: the first against Fort Duquesne, the second against Fort Ticonderoga and Crown Point, and the third against Louisbourg. Following the successful realization of these three objectives, offensives could be mounted against Quebec and Montreal. In many respects, Louisbourg was the key to the overall British plan.

In March 1758, Pitt replaced John Campbell, Lord Loudoun, with his deputy, Major General James Abercromby, as British commander in chief in North America. In his new command, Abercromby found himself the beneficiary of Loudoun's substantial training efforts and the building up of auxiliary services.

As the English prepared to take the offensive, French forces in North America were forced on the defensive. The military commander of New France, Major General Louis-Joseph, Marquis de Montcalm, found himself severely handicapped by serious shortages of men, weapons, supplies, and even food. Anticipating an English assault on Louisbourg, however, Montcalm did increase the size of the French naval squadron there. When the British attacked, 11 French warships, 5 of them ships of the line, were in the harbor to add their numerous cannon to the defense of the fortress. Montcalm also added two reasonably well equipped battalions to the defending force. In all, the French defenders of

Casualties during the Siege of Louisbourg, 1758

	British	French	
KIA	195	400-800	
WIA	363	1,400	
POW	0	3,600	

Louisbourg numbered some 6,000 men: 2,000 land troops, 1,000 marines, 2,600 seamen, and 400 militiamen.

The British did effectively isolate the battlefield. They blockaded and prevented French ships in Mediterranean ports from sailing to North America. While they were unable to achieve the same result off the French Atlantic ports, of 23 ships dispatched by the French to Louisbourg, including 12 transports, only 7 managed to reach that place. A major French fleet arrived too late.

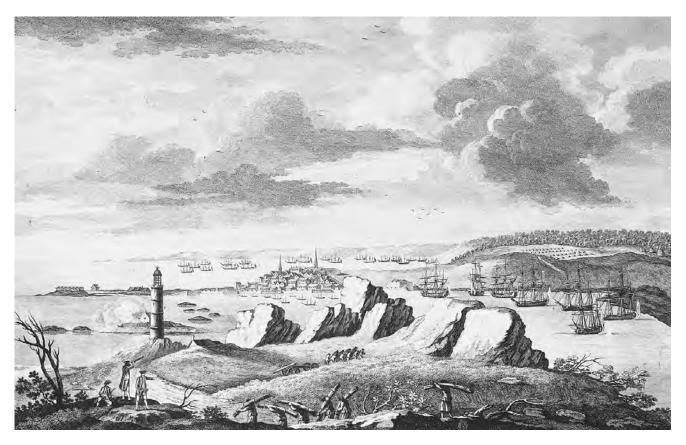

In March 1758, Major General Jeffery Amherst took command of the British invasion force. Rear Admiral Charles Hardy also arrived at Halifax that same month to assume command of the British squadron already dispatched there by Pitt. As soon as weather permitted he took up station off Louisbourg. In all, the British earmarked for the invasion 39 warships manned by 14,000 officers and men. Admiral Edward Boscawen, the designated naval commander, arrived at Halifax on May 9. The expeditionary force, numbering in all 167 ships of all kinds, sailed on May 29.

Amherst's land force of 13,200 men consisted of 14 infantry companies, 4 ranger companies, and an artillery detachment. This force was formed into three brigades under the command of three brigadier generals: James Wolfe, Charles Lawrence (governor of Nova Scotia), and Edward Whitmore. On June 8, the British invasion force began coming ashore on Cape Breton Island. The landing site was Gabarus Bay about four miles to the southwest of the fortress, the same general location chosen in 1745.

The governor of Louisbourg, Augustin de Boschenry de Drucour, had done what he could to prepare for a British assault. The French had repaired and strengthened the fortress after its return to their control in 1748 and they mounted more guns and constructed extensive shore defenses manned by 2,000 men along Gabarus Bay to prevent a repeat of 1745. Drucour saw the warships, commanded by Admiral Jean-Baptiste Degaulle, in a purely defensive role. The ships' guns were to help protect the fortress from its water side.

En route to Louisbourg, the British fleet was dispersed by bad weather, but it rendezvoused off Gabarus Bay southwest of the French fortress on June 2. Amherst and Wolfe surveyed possible landing sites, but bad weather kept them from carrying out a landing until June 8. The British boats made for shore in three groups. Those in the center and on the right were feints. The main attack was by Wolfe's brigade on the left at the extremity of the French line. Seven ships provided covering fire for the assault. Once Wolfe was ashore, the other two brigades were to slip to the west and land behind him.

The troops came ashore in surf and under heavy fire from the shore. The landing almost failed. Both sides understood that if the

Engraving of the Siege of Louisbourg on Cape Breton Island, Nova Scotia, by British forces under Major General Jeffery Amherst in 1758. (The Granger Collection)

British gained a foothold and began their siege, it would simply be a matter of time before Louisbourg fell. The British troops fixed bayonets and, after a hard fight, drove the French defenders from the beaches. The remainder of the British troops had come ashore by nightfall.

High winds ended any British communication with the troops ashore for several days. On June 11, the British were able to bring some artillery ashore. At the same time Boscawen's ships blockaded the harbor entrance. Ashore in heavy fog and under almost constant fire from the fortified town and French ships in the harbor, the British began to dig siege lines and slowly extend them closer to the fortress. As much of an impediment as it was, the weather actually served to aid the British.

Fog masked Wolfe's attack on and seizure of Lighthouse Point on June 12. Soon the British had established a battery there, overlooking the Island Battery that guarded the harbor entrance. On June 18, the French sank four of their smaller warships in the middle of the channel to block the harbor entrance, but the next day the British opened fire on the Island Battery. It was finally silenced on the 26th.

By July 1, the British took possession of the high ground overlooking the Dauphin Gate, the main entrance to the fortress. Two days later the British placed their guns on the high ground and began to bombard the French positions and, by July 6, the town itself. The French attempted several night sorties against the British positions but with scant success. Meanwhile, the British continued to extend their trenches.

On July 9, the French attempted a night sortie with their ships but without major result. On July 22, the settlement's church and other buildings were set ablaze by the British bombardment. By July 16, British guns were just 200 yards from the Dauphin Gate. The French ships off the fortress were providing effective fire against the British troops ashore, but on July 21 the Entreprenant of 74 guns, one of the two largest French ships, caught fire, possibly from a lucky British shot, and blew up. Its flames set on fire two other ships of the line, the Célèbre (64 guns) and the Capricieux (64 guns). All three ships were a total loss. With the other two ships of the line continuing to fire on British troops, Boscawen launched a boat attack against them on the foggy night of July 25. Some 600 British seamen in 50 boats succeeded in capturing the Prudent (74 guns), which, being aground, was burnt. The British towed the Bienfaisant (64 guns) off to the northeast of the harbor. Boscawen then prepared to enter the harbor with six of his ships of the line, but that action proved unnecessary.

There was little the French could do at this point but surrender. On July 26, 1758, Drucour asked for terms. The defenders had conducted themselves with honor and in accordance with the accepted European rules of warfare and should have been allowed easy terms, yet Amherst denied the French all honors. Memories of the 1757 campaign and what had occurred after the British surrender of Fort William Henry were fresh, particularly among the Massachusetts men who participated in the expedition. Those who had taken up arms against the British became prisoners of war and were transported to England. The civilian population of the fort and the French population of Cape Breton and today's Prince Edward Island, more than 8,000 men, women, and children, were subsequently deported to France.

During the siege, the British lost 195 men killed and another 363 wounded. French losses were estimated at between 400 and 800 men killed. There were 3,600 prisoners, including 1,400 wounded. In addition, the British secured 216 guns and some mortars.

The fall of Louisbourg dealt a serious blow to morale in New France. With Louisbourg in British hands, the possibility of reinforcements from metropolitan France was greatly diminished. It was also clear that the next major British thrust would be against Quebec itself. Strategically as well as symbolically, the British capture of Louisbourg was a defeat from which the French would never recover. Britain also gained control over the lucrative Atlantic fisheries.

Louisbourg Expedition

Start Date: January 9, 1745 End Date: June 17, 1745

Successful British and colonial attack on the French fortress at Louisbourg located on Cape Breton Island, during King George's War (1744–1748). After ceding Acadia to Great Britain in 1713 at the conclusion of Queen Anne's War (1702–1713), the French began fortifying Louisbourg on Cape Breton Island to protect the entrance to the St. Lawrence River. When King George's War began in the spring of 1744, French troops and warships from Louisbourg

launched attacks against British posts in Nova Scotia. In so doing, they captured the fort and fishing station at Canso and then undertook an unsuccessful siege of Annapolis Royal. Meanwhile, French privateers and naval vessels operating from Louisbourg struck at British and colonial merchant vessels along the coasts of Nova Scotia and New England.

These French operations alarmed Massachusetts Gov. William Shirley, who feared that if the French succeeded in capturing Nova Scotia, New England would be vulnerable to attack. Shirley believed that the best way to prevent such a disaster was to mount an expedition and capture Louisbourg. Encouraged by reports from traders indicating that the garrison numbered only 700 men and lacked provisions, and that the fortress was in poor condition, Shirley asked his colony's General Court on January 9, 1745, to approve an attack. The legislators demurred, but Shirley continued to pressure them. A few weeks later, they authorized the enlistment of 3,000 troops for the Louisbourg Expedition.

Inspired by anti-Catholic religious zeal and the promise of plunder, recruits quickly came forward. Other colonies pledged their support as well. New Hampshire and Connecticut each raised a regiment of volunteers, Rhode Island provided a warship and three infantry companies, and New York supplied some artillery and funds. New Jersey and Pennsylvania also made financial contributions, and Virginia sent provisions.

Shirley named provincial council president William Pepperell commander in chief of the expedition. Preparations were completed rapidly and the force of more than 4,000 men sailed from Boston and other ports on March 24, 1745. When the vessels made their rendezvous at Canso, they were forced to wait three weeks for the ice to melt so that they could approach Louisbourg.

The delay nevertheless proved beneficial. Shirley had asked British commodore Peter Warren to provide naval assistance. Warren, whose ships were in the West Indies, initially declined because he did not have London's approval to participate. Authorization arrived in early March, however, and Warren promptly sailed northward to meet the New England ships.

With the Royal Navy on hand, New England soldiers landed in Gabarus Bay on April 30 and brushed aside the handful of French defenders. Advancing toward the fortress, the attackers were halted by artillery fire. Secondary attacks seized two French outposts on the island prior to the commencement of siege operations. Pepperell was aided by the fact that Louisbourg's fortifications had fallen into disrepair, and that although the defenses guarding the harbor approaches were strong, those on the landward side were lower than the neighboring hills and thus vulnerable to artillery. The French commander, Governor Louis Du Pont Duchambon, had not expected the attack, and doubted the reliability of his troops. Indeed, a Swiss unit, which comprised 20 percent of his force, had recently mutinied.

The New Englanders began to construct siege lines and labored to position their artillery on the hills overlooking the fortress. Aside from a few attacks on stragglers by Canadians and allied natives,

William Pepperell, commander of the English expeditionary force during the attack on Louisbourg in 1745. The capture of this French fortress was the greatest military victory for English colonial forces prior to the American Revolution. (Library of Congress)

Pepperell's force met no opposition. Three days after landing, the first artillery pieces opened fire on the French defenders.

On May 3, Pepperell gained a major advantage when his troops occupied the Royal Battery north of the fortress. Fearing that they would be cut off, the battery's defenders had spiked the cannon and fled, taking some supplies but leaving a significant quantity of artillery ammunition behind. New England blacksmiths soon repaired the 30 damaged guns and then turned them against the French. Duchambon suffered another reversal on May 19 when British ships captured the 64-gun French *Vigilante* and the cargo of munitions it was transporting to Louisbourg.

The besiegers methodically advanced their lines closer to the fortress, constructing batteries and maintaining the bombardment, which was often interrupted by shortages of gunpowder. Its effect was also lessened by the inexperience of the artillerists, who blew up nine of their own guns and a mortar by overcharging them with gunpowder. Disease and the cold climate additionally plagued the New Englanders.

Pepperell attempted a night attack on May 26 against the Island Battery, but the assault failed and almost half of the 300 men who made the attempt were lost. But this small French victory was insufficient to halt the increasing effectiveness of the siege, as Pepperell

relentlessly advanced his batteries and trenches. On the night of June 15, while Pepperell and Warren were discussing a combined land and sea attack on the fortress, Duchambon decided that further resistance was futile and offered to surrender. Nearly 10,000 shells and cannonballs had demoralized his troops and battered the fortifications. A New England battery on Lighthouse Point had rendered his Island Battery nearly useless, only three cannon at the Circular Battery were still serviceable, and the fortress wall near the Dauphin Gate had been breached. Attempts to repair the damaged defenses had not kept up with the destruction and exhausted the garrison. The French had few provisions and little ammunition remaining.

The terms of surrender allowed the defenders to march out with the honors of war. Civilians in the fortress were permitted to return to France with their belongings, and the victors were not allowed to plunder. Pepperell's soldiers and Warren's sailors entered Louisbourg on June 17. Surprisingly, the attack on and siege of Louisbourg had not resulted in heavy casualties. The British and colonials lost about 150 men, and it is believed that the French lost a similar number.

After their initial elation at the victory had subsided, the New Englanders were rather disappointed. Not only had they been denied the expected plunder, but they found themselves left to garrison the fortress throughout the following winter. Lacking adequate food, clothing, and shelter, more than 900 New England troops died from disease and exposure in the bitter winter weather. They also took a dislike to their counterparts in the Royal Navy, resulting in at least one serious brawl between American soldiers and British sailors. Worst of all, the colonists' efforts appeared to have been wasted when the British government returned Louisbourg to France under the terms of the 1748 Treaty of Aix-la-Chapelle that ended the war.

Louisiana

A French- and Spanish-controlled territory in central North America from 1682 until 1803, at which point the United States purchased the region from France. France ruled the vast Louisiana region from 1682 until 1763. Following the French and Indian War (1754–1763), Britain took possession of the portion of Louisiana east of the Mississippi River, with the exception of New Orleans, which went to Spain along with the western part of the Louisiana Territory. In 1800, the Spanish crown agreed to a secret deal with French ruler Napoleon Bonaparte that ceded the territory back to France. In 1803, a cash-strapped Napoleon sold the territory to the United States for \$15 million. At its height, French claims covered the drainage area of the Mississippi River extending from the Rocky Mountains in the west to the Appalachian Mountains in the east.

The French were not the first to explore the region, but they would lay an extensive claim to the area nonetheless. The Spanish had explored along the southern coast as early as 1519, and Hernando de Soto passed through the southern portions of the region in 1541. French exploration of the region began from Canada via the St. Lawrence River and across the Great Lakes and then down the Mississippi River. Among early explorers were Jacques Marquette and Louis Jolliet in 1673. In 1682, René-Robert Cavelier, Sieur de La Salle, formally claimed the region for France and named it after King Louis XIV.

Spanish concerns in the region centered on France's possession of the Gulf Coast and its potential effect on Spanish Florida and Mexico. French development of Louisiana began with Pierre le Moyne d'Iberville's establishment of Fort Maurepas on Biloxi Bay

in 1699. D'Iberville then founded Fort Louis, near present-day Mobile, Alabama, in 1702. In the north, Antoine La Mothe, Sieur de Cadillac, founded Detroit in 1701. The establishment of Fort Rosalie (Mississippi) in 1716, however, placed the French more inland and among the Natchez tribe.

The vast size of French Louisiana included a large number of Native Americans with diverse interests and cultures. The region included the more sedentary tribes of the American Southeast, such as the Creeks, and the more nomadic peoples of the plains, including the Sioux. French relations with the native peoples often varied with the size of the French presence. That the French maintained possession of Louisiana in spite of the lack of a large European presence throughout the region speaks well of their relationships with the local native populations. But this does not mean that these relations were always friendly. In the 1730s, the French fought both the Natchez and the Chickasaws, virtually destroying the Natchez Nation and soundly defeating the Chickasaws.

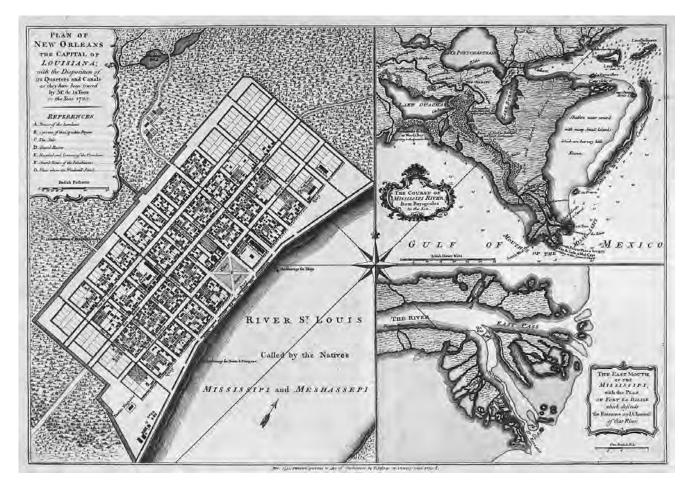

French relations with American Indians tended to go deeper than those of their British counterparts. The French Catholic Church was interested in converting the "savages" to Catholicism. In many respects the spread of religion had greater long-term impact on the territory than government policy. Spreading Catholicism served two purposes: saving souls, and making natives more willing to act as French allies in imperial struggles. Adding to the connection between the two was the frequent intermarriage of French traders and colonists with Native Americans.

In 1718, Jean-Baptiste Le Moyne de Bienville established New Orleans. It soon became French Louisiana's most important city. In 1722, the French named it the colonial capital. Its location provided access to the mouth of the Mississippi River, and thus it served as the economic hub of the entire river system. Indeed, control of the city meant control of the North American interior.

The Louisiana region was populated by groups other than the French and Native Americans, however. African slaves were introduced to the region in the 1710s to provide labor on plantations near New Orleans. In 1724, the French promulgated the *Code Noir* (Black Code), laying out the legal status of slaves. It also required Jews to leave the colony, making Catholicism Louisiana's only public religion. A number of Germans emigrated to Louisiana, and Louisiana gained French-speaking immigrants from one of Britain's most unfortunate displacements—the expulsion of most Acadians from eastern Canada in the 1750s.

The French colonization of North America moved inland from both north and south, blurring the boundaries between the colonies of Louisiana and New France. The Illinois Country, first explored from New France, was added to Louisiana in 1717.

Trade and commerce for much of Louisiana remained in furs and deerskins, as well as mining and agriculture. Trade with the natives tended to be lucrative. The most significant role for the colony, however, was imperial, as it served to block British and Spanish expansion on the North American continent.

Plan of New Orleans, the capital of Louisiana, ca. 1771. (Library of Congress)

The political status of Louisiana did not remain constant during the French period. In 1712, it became a charter colony under the control of Antoine Crozat, with Cadillac as governor. In 1717, John Law's Company of the West, later to become the Compagnie des Indes (Company of the Indies), secured control. Louisiana returned to the status of royal colony in 1731 and remained as such until 1763. Bienville played an important role in the development of the colony, serving four terms as governor of Louisiana (1701–1713, 1716–1717, 1718–1724, and 1733–1743). Pierre de Rigaud Vaudreuil de Cavagnial succeeded Bienville, serving until 1752. Louis Billouart, Chevalier de Kerlerec, held the governorship from 1753 to 1763 during the French and Indian War.

Much of the Louisiana region remained relatively untouched by French, or even later, Spanish, colonial government. However, there were French settlers along both sides of the Mississippi River. This would be a boon to the new city of St. Louis when the region was split in 1763. Indeed, a number of French citizens in the Illinois Country were more comfortable under the rule of the Catholic monarch of Spain rather than the Protestant British king.

French influence continued farther up the Mississippi, with the founding of St. Genevieve around 1750. Expansion continued even

after the territory was transferred to Spain. St. Louis was founded in 1764 near the confluence of the Mississippi River and Missouri River, and St. Charles (modern-day Missouri) was founded in 1769 near the mouth of the Missouri River.

Although there was fighting between the French and the Native Americans, Louisiana saw little imperial warfare in the period prior to 1763. Nevertheless, the outcome of the French and Indian War did have a profound impact on the region. Indeed, Louisiana's status changed at the conclusion of the conflict, when the territory was divided between Britain and Spain. Under the Treaty of Paris in 1763, Britain received the eastern portion, minus New Orleans, and to compensate it for its losses fighting on the side of France, Spain received the area west of the Mississippi under the 1762 Treaty of Fontainebleau.

The one significant threat to the colonial status of Louisiana came with the split in 1763. A number of French inhabitants balked at becoming Spanish subjects. In 1768, when new Spanish governor Antonio de Ulloa attempted to impose Spanish trade regulations, French colonists in New Orleans rebelled. The Spanish were subsequently able to establish some semblance of loose control over the western areas of Louisiana. Indeed, Louisiana would be the

most liberally ruled territory of the Spanish empire. In the eastern portion of Louisiana, the British moved carefully, establishing the colony of West Florida but taking care not to provoke Native American resentment of English settlements in the region.

Lovewell, John

Born: October 14, 1691 Died: May 8, 1725

British colonial soldier and captain of an independent military company during Dummer's War (1722–1727). John Lovewell was born on October 14, 1691, in Dunstable, Massachusetts. His family had settled in Dunstable in the 1680s and eventually came to own land and a mill along Salmon Creek. Lovewell and his own family would eventually own and work 200 acres of land.

From an early age, Lovewell had experienced war with New England's Native American population. Indeed, Dunstable, a designated frontier town, came under attack during King William's War (1689–1697) in 1691 and twice during Queen Anne's War (1702–1713) in 1703 and 1706. Along with the other remaining inhabitants of Dunstable, the Lovewells crowded into several garrison houses, living fear-filled and circumscribed lives.

During Dummer's War, Native Americans raided Dunstable in September 1724, capturing two inhabitants and killing most of the pursuing force. In response, Lovewell and other Dunstable inhabitants petitioned the Massachusetts General Court for assistance. To minimize costs to the colony yet improve frontier defenses, the court offered a £100 bounty for every male Native American scalp in hopes of encouraging private citizens to form armed companies to patrol the borderlands.

Lovewell was elected captain of one such company and proceeded to wage war against the local natives. In two expeditions in December 1724 and January 1725, Lovewell's men took several scalps and prisoners, collecting cash bounties and receiving accolades in Boston. On a third expedition into the White Mountains on May 8, 1725, however, Lovewell's company fell into an ambush. Lovewell and several of his men were killed, and the remnants of his company straggled back to Massachusetts frontier towns. What came to be called Lovewell's Fight had ended in disaster.

Lovewell's Fight

Event Date: May 8, 1725

Battle between an English scalp-hunting party led by John Lovewell and Abenaki Native Americans near modern-day Fryeburg, Maine (then part of Massachusetts), on May 8, 1725. During Dummer's War (1722–1727), a conflict between the New England colonies and the Abenakis across the New England frontier, the Massachusetts government offered £100 bounties for native scalps. This profit potential encouraged private citizens to form independent military companies, unsupported by the provincial government, that ranged the New England frontier in search of scalps.

Lovewell, of Dunstable, Massachusetts, formed one such company. He had led successful outings against Native Americans in late 1724 and early 1725, taking more than 10 scalps. Encouraged by his success, Lovewell led his company of 46 men north toward the White Mountains of New Hampshire in April 1725. At Lake Ossipee, Lovewell constructed a crude stockade to serve as a refuge for a sick soldier as well as a rally point in case of disaster. Leaving the ill man, the company's doctor, and an 8-man guard, Lovewell and his remaining men marched toward Pigwacket on the upper Saco River. The Pigwacket Abenakis had already staged numerous raids on border settlements in New England.

While bivouacking along Saco Pond near present-day Fryeburg, Maine, on May 7, Lovewell's band heard Abenakis moving in their vicinity. The next morning, the scalp hunters heard a gun shot. Leaving their packs unguarded, the men investigated the sound and found a lone native hunting ducks. Although the company managed to kill

the man (the chaplain claimed the scalp), Lovewell and another man were wounded and the men failed to find other natives. Unbeknownst to Lovewell, during this action, Paugus, the party's intended target, and at least 40 native warriors had returned from a reconnaissance and discovered Lovewell's unguarded packs. There they set an ambush and awaited the return of the English scalp hunters.

When Lovewell's company returned to their camp to claim their packs, the warriors fired on and rushed the Englishmen. Lovewell fell in the first volley, but his outnumbered men returned fire, took cover where they could, and kept up the battle until sunset. Several men on both sides knew one another, and they exchanged taunts and insults throughout the day-long battle. Casualties on both sides were heavy. With Paugus and at least 9 other warriors dead, the Abenakis gathered their casualties and abandoned the field. Only 23 Englishmen remained alive, and of these survivors, 14 were wounded, 1 mortally and 2 more unable to travel. The remaining men marched toward the company's fortification on Lake Ossipee. Instead of finding relief and medical help there, the survivors found the post abandoned. Apparently, one of Lovewell's men had run away at the fight's onset, and had carried exaggerated news of a massacre to the guard detail, quickly sending them homeward. The remnants of Lovewell's band straggled back into Dunstable, Berwick, and Biddeford on May 11, losing 4 more men along the way.

While Lovewell's defeat led to a decline in the popularity of scalp hunting, his expedition forced the Pigwacket Abenakis to abandon their village until a peace settlement was negotiated.

Luna y Arellano, Tristán de

Born: 1505

Died: September 16, 1573

First Spaniard charged with founding permanent settlements in Spanish Florida during 1559–1562. Tristán de Luna y Arellano was

a Castilian born in Borobia, Spain, in 1505. He was the cousin of Juana de Zúiga, the wife of Hernán Cortés. In 1531, Luna y Arellano arrived in Mexico to seek fame and fortune. In 1540, he served with Francisco Vásquez de Coronado during his expedition to Cibola.

Luis de Velasco, viceroy of New Spain, believed it necessary to establish military settlements on both the Gulf Coast and southern Atlantic Coast. This, he reasoned, would prevent encroachments on Florida from other European powers, help convert the Native Americans to Christianity, and safeguard Atlantic shipping. Thus he dispatched Luna y Arellano to colonize Florida in 1559. Luna y Arellano commanded a fleet of 13 ships transporting 500 infantry, 200 cavalry, and more than 1,000 colonists. Among the latter were women, children, slaves, and natives. Luna y Arellano was tasked with establishing settlements in Pensacola (on the Gulf Coast) and Santa Elena (present-day Parris Island, South Carolina). His ultimate goal was to establish an overland route connecting the two communities.

Luna y Arellano arrived off the coast of Pensacola on August 15, 1559. After going ashore, he established the town of Santa María. A few days after his arrival, however, a hurricane destroyed most of his ships, and ruined much of the expedition's supplies. Luna y Arellano also found it impossible to reach Santa Elena overland. It was difficult to penetrate the interior because of the terrain, thick vegetation, hostile natives, and the lack of proper provisions. Notwithstanding repeated attempts to sustain the settlement at Santa María, dissent among the hungry troops and colonists led to mutiny.

With Luna y Arellano's attempts at colonization largely unsuccessful, he was recalled to Mexico. Shortly thereafter, the surviving colonists abandoned the colony. After the failure of the Luna y Arellano expedition, the Spaniards ignored the Gulf Coast of Florida until 1693, when Andrés de Pez led a scientific expedition into the region. Angel de Villafane's subsequent attempt to colonize Santa Elena also ended in failure. Luna y Arellano died in Mexico City on September 16, 1573.

Lyttelton, William Henry

Born: December 24, 1724 Died: September 14, 1808

Governor of South Carolina (1756–1760) and governor of Jamaica (1761–1766). William Henry Lyttelton was born into an aristocratic

family in Buckinghamshire, England, on December 24, 1724, and graduated from Oxford University in 1742. He began his political career as a member of Parliament in 1748. His political fortunes rose alongside those of his close family friend, William Pitt. In 1755, Lyttelton secured appointment as governor of South Carolina, replacing the disfavored James Glen. Lyttelton assumed the government post in 1756 amid the French and Indian War (1754–1763) and numerous and disturbing rumors of French-inspired native attacks against Carolina. Glen had for years negotiated peaceful relations with the southeastern American Indians, conducting talks with the Cherokees even as Lyttelton arrived. Lyttelton, more popular with the Carolina Assembly and the royal government than Glen, pressed for a more forceful Native American policy, and reaped his rewards during the Cherokee War of 1759–1761.

Lyttelton, an ambitious man, hoped to achieve bold gains in native affairs that he could report back to London. Glen, he believed, had been too pacific in treating with Carolina's indigenous neighbors. Lyttelton believed a firmer hand was needed in dealing with the Cherokees, whose recent open dalliances with the French and their Native American emissaries threatened the longstanding Anglo-Cherokee alliance that safeguarded Carolina's western frontier. Lyttelton's boldest and most ill-advised move came in the fall of 1759. Emboldened by news of British victories in the north, Lyt-

telton decided to force the Cherokees into submission. When a Cherokee peace delegation of headmen arrived in Charles Town (present-day Charleston) in October, Lyttelton had them arrested and marched as hostages to Fort Prince George-Keowee, believing the Cherokees would not risk war. This move backfired, however, for it inflamed anti-British sentiment in the Cherokee towns and inspired an attack on Fort Prince George-Keowee. These actions sparked the Cherokee War. Lyttelton did not remain much longer in Carolina, as he accepted the governorship of Jamaica in 1761. He eventually retired to Britain, was raised to the peerage, and spent his later years as a man of letters before dying in Worcestershire on September 14, 1808.

Mabila, Battle of

Event Date: October 18, 1540

The bloodiest battle in North America prior to 1862, pitting Spanish forces against the Choctaws. The battle occurred on October 18, 1540, at the confluence of the Alabama River and the Cahawba River in modern-day central Alabama, between a Spanish army of 600 explorers led by Hernando de Soto and several thousand Choctaws led by Tascalusa. During de Soto's exploration of the American Southeast, he seized Tascalusa and held him as a hostage.

On October 18, 1540, on arrival at the fortified Choctaw town of Mabila, de Soto's followers noticed that the settlement's inhabitants included thousands of warriors armed with bows, spears, and clubs. There were few women, children, or elderly men. De Soto entered the town accompanied by several dozen followers, whereupon they were ambushed by Choctaw warriors concealed in town buildings.

The Spanish managed to cut their way free, but they lost 20 of their number in the immediate fighting. None of the Spanish troops inside the town escaped unscathed, despite armor that proved sufficient to prevent most lethal wounds. During the escape, the Spanish lost virtually all of their baggage and equipment.

After escaping the ambush, de Soto's men fought a pitched battle outside Mabila's palisade. In the open, the Spanish were able to use superior technology and cavalry tactics to powerful effect. In so doing, they slaughtered hundreds of Choctaws outside the town. As the Choctaws retreated behind Mabila's wooden walls, de Soto ordered his men to form four squadrons and assault the palisade surrounding the town from every direction. The Spanish breached the rough-hewn log palisade and then threw torches at the thatched roofs

The aftermath of Hernando de Soto's attack on the town of Mabila. The Battle of Mabila, fought on October 18, 1540, between Choctaw Native Americans and Spaniards, resulted in at least 2,000 Choctaw casualties. (North Wind Picture Archives)

of houses in the town. De Soto kept a mounted patrol on each side of the palisade to kill any Choctaws attempting to escape the inferno.

Although the defenders repulsed the Spanish repeatedly, they suffered heavy casualties in each assault. After a nine-hour battle, resistance ended, and every Choctaw defender who had survived the fires was cut down by the Spanish. The town burned to the ground in the fighting, destroying all of the captured Spanish baggage.

By the end of the day's fighting, at least 22 Spaniards were dead and an additional 148 were wounded. Some historians estimate Spanish casualties at 70 dead and hundreds wounded. Most accounts place the Choctaw casualties at between 2,500 and 3,000, although one Spanish witness to the battle claimed 11,000 Choctaws perished in the fighting and its aftermath. Tascalusa's remains were never found by the Spanish, but it is likely that he died in the fighting or in the conflagration. In any event, no mention of Tascalusa is found in any later European account.

Following the battle, de Soto continued his exploration and conquests, despite talk of mutiny among his followers, many of whom wished to abandon the expedition and return to Cuba.

Mahicans

Native American group, an eastern part of the Algonquins, who inhabited the interior northeastern part of North America. The French often called them Loups, the French word for "wolves." Mahican is the Dutch spelling of the tribe's name; Mohican, less in favor today, is the English spelling. The Mahicans' homeland was the upper Hudson River Valley, from the Catskill Mountains north to the southern tip of Lake Champlain. From the Schoharie River their homeland extended east to the Berkshire Mountains of Massachusetts and from northwestern Connecticut to southern Vermont. They are not be confused with the Mohegans of Connecticut.

The five clans of the Mahicans lived in fortified villages, each comprising 20 to 30 longhouses on hills. The Mahicans were agriculturalists who also hunted, fished, and gathered wild foods. In addition, they traded for Great Lakes copper, which they used in jewelry and arrowheads.

Living inland, the Mahicans generally avoided slavery under European ship captains. As such, they lacked the hostility toward Europeans that was so evident in coastal tribes. Indeed, the Mahicans were friendly toward, and eager to trade with, the explorer Henry Hudson in 1609. They also engaged in the fur trade with the

Dutch. Mahicans adapted quickly to Dutch firearms and were excellent marksmen.

The fur trade, however, exposed the Mahicans to European diseases and destabilized their region. The Mahicans fought an on again-off again war with the Mohawks, who desired part of the lucrative Mahican wampum production on Long Island Sound as well as a share of the Dutch fur trade. By 1623, the Mahicans were harvesting more furs than nature could replenish, in effect largely exhausting the fur supply. In consequence, when the West India Company acquired the charter of New Netherlands in 1624, Dutch policy favored settlement rather than trade.

The Dutch intermarried with the Mahicans, but they also created difficulties for them. The Dutch request that the Mahicans arrange trade with the Algonquins and French-allied Montagnais, enemies of the Mohawks, provoked a war with the Mohawks during 1624–1628. The Dutch initially supported the Mahicans, but with the Dutch sustaining casualties, Gov. Peter Minuit evacuated Fort Orange (Albany) and began a policy of strict neutrality. The Mahicans lost the war in 1628 and were forced to pay tribute to the Mohawks.

To provide the Mohawks with wampum for the Dutch trade, the Mahicans subdued and absorbed lesser tribes such as the Wappingers. The Mahicans maintained their villages in the vicinity of present-day Albany, New York, although many Mahicans relocated north and east to escape the Mohawks altogether. Disease and war both took their toll.

The Mahicans joined the French anti-Iroquois alliance in 1650. They continued relations with the Dutch and other Europeans and their intermittent war with the Mohawks until the English took New Netherland in 1664. The Mahicans had less influence with the English than did the Mohawks and other Iroquois. They moved to western Massachusetts and in 1672 fell under the protection of the Iroquois League. The Mahicans played only a limited role in the 18th-century wars between the English and the French, often appearing on the English side as scouts or auxiliaries. They also fought on the Patriot side in the American Revolutionary War.

As European settlements encroached, the Mahicans sold their land. By 1775 the last of the Mahican land holdings was at Stockbridge, Massachusetts, where they held only 200 acres. The Mahicans' population plummeted over the course of two centuries. In 1600, the Mahican Confederacy near Albany, New York, may have numbered some 8,000 people. By 1672 the population was only about 1,000, and by 1796, Mahicans numbered just 300 people in Stockbridge, living with the Oneidas and the Brothertons in New York, and 300 with the Delawares and the Wyandots in Ohio. Other Mahicans moved to present-day Indiana or beyond the Mississippi River.

Maine

During the early 1600s, English and French explorers visited the coast of Maine and saw its commercial potential. Fishing vessels from France, England, and Virginia soon plied the Gulf of Maine and set up seasonal camps on the coast. English and French traders moved inland and established fur-trading posts.

Cultural and economic rivalries among four players dominated Maine's colonial history. At first European contact in 1524, about 20,000 Algonquian-speaking Abenaki people inhabited Maine. By 1619, some three-quarters of them had succumbed to a cataclysmic series of epidemics caused by European pathogens.

From their first landfall in 1605, the French considered eastern Maine to be part of their colony, Acadia, and challenged English traders for control of the territory. Throughout the years the French possessed Acadia, they encouraged the Abenakis to attack Maine's English settlements. By 1630 a dozen English villages dotted the Maine coast. Their economies relied on fish, timber, and beaver

pelts. Two kinds of English settlers vied with each other for control of western Maine. Puritans began settling the region, bringing with them the established authority of Massachusetts. They clashed with the independent-minded, non-Puritan fishermen, traders, and woodcutters who preferred to live at the rocky edge of civilization. By 1652, the Maine settlements accepted Bay Colony authority despite enduring religious and cultural differences. Maine was to remain a province of Massachusetts until 1820.

The 1675 outbreak of King Philip's War along the New England frontier put Maine's settlements on the firing line. English encroachment on native lands and the unfair trading practices and capricious brutality of some English traders drew several Abenaki tribes into the conflict. They attacked and destroyed isolated, vulnerable Maine settlements. The English prevailed on some Abenakis to remain neutral and forced them to give up their weapons as security. Unable to hunt, many of these neutralized Abenakis simply starved. The aggrieved survivors ultimately took up arms against the English.

After Metacom's 1676 slaying brought an end to King Philip's War, the remnants of the defeated New England tribes took refuge among the Abenakis in Maine. They continued to raid Maine's English settlements. When the Maine settlements asked New England for relief, Massachusetts voted to send an expedition. It could ill afford such a foray, but saw an opportunity to assert greater authority over Maine. War-weary Massachusetts sent battered remnants of its militia to Maine under the command of Richard Waldron. Waldron's duplicity and brutality drove neutral Abenakis into the hostile camp. Defeat piled on disaster as the Abenakis threw everything

Woodcut of French missionaries coming ashore in Somes Sound, Mount Desert Island, Maine, in the early 1600s. (North Wind Picture Archives)

they had at Maine's settlements. Fearing that the French would take advantage of the situation, the Duke of York ordered Edmund Andros, the governor of New York, to come to Maine's assistance. Andros sent a force to Pemaquid in the summer of 1677 and decreed that it would be the seat of authority for all trade and settlement. He ordered the New Englanders and natives to meet for peace talks. The resulting Peace of Casco was concluded in April 1678, but neither the Puritans, the Maine settlements, nor the Abenakis found the imposed agreement satisfactory.

English settlers continued to encroach on Abenaki land. The various Abenaki peoples formed an alliance in 1688 and attacked English towns during King William's War (1689–1697). French and Abenaki fighting men forced the colonists to abandon all settlements east of Wells in 1690. Massachusetts sent an expedition commanded by Benjamin Church to destroy native villages and crops. Church built Fort William Henry at Pemaquid in 1692. In 1696, native warriors captured the fort. Hostilities in Maine continued for two years after France and England made peace.

Queen Anne's War (1702–1713) brought another decade of bloodshed. A 500-man French and native force destroyed a number of coastal Maine towns in 1703, and Massachusetts declared war on all of Maine's native people. Many Abenakis, recalling years of hardship and hunger during earlier wars, retreated inland toward the St. Lawrence.

After the Treaty of Utrecht in 1713, the English expanded once again into Abenaki territory. A band of Abenakis conducted raids against English settlements in the Kennebec region in 1720. In July 1721, Lt. Gov. William Dummer of Massachusetts declared war on the Abenakis. In one of the war's decisive engagements, in August 1724, New England militiamen marched on the central Abenaki village, Norridgewock, and killed a French Jesuit and several dozen Abenakis. Dummer's War ended in 1727, with the victors imposing a one-sided treaty on the permanently dispersed and weakened Abenakis.

During King George's War (1744–1748), Maine militiamen—led by Maine's Sir William Pepperell—participated in the 1745 capture of the French fortress at Louisbourg. Massachusetts again declared war on the Abenakis. Some Abenaki bands allied with the English and some with the French. The end of the war in Europe did not put an end to raids and counterraids in Maine. Years of strife over the expanding English frontier led to further English-native conflict in Maine during the French and Indian War. The Maine frontier saw its last native raids in 1758. In the decade following the end of the French and Indian War, the English population doubled, from 23,000 to 46,000.

March, John

Born: June 10, 1658 Died: July 1712

Officer in the Massachusetts Bay Militia. Born on June 10, 1658, in Newbury, Massachusetts, John March worked as an innkeeper and shipbuilder in Newbury before joining the militia. In 1690, he was captain of a company of volunteers under the command of Sir William Phips, which had just participated in the unsuccessful expedition against Quebec.

March stayed at Fort William Henry at Pemaquid, Maine (then part of Massachusetts), during 1692–1695. In November 1694, he was instrumental in the capture of Bomoseen, the Norridgewock chief, when the latter came to Pemaquid for a conference. In 1697, Lt. Gov. William Stoughton dispatched March, now a major, along with about 500 soldiers, to prevent any movement by the French against the eastern frontiers of Maine. March successfully repulsed a war party of 200 Native Americans and Frenchmen on the banks of the Damariscotta River on September 9, 1697.

In 1702, March became commander at the Fort at Casco Bay (Fort Loyal, Falmouth, now Portland, Maine). At the outbreak of Queen Anne's War (1702–1713), the fort came under heavy attack by the Abenakis. March was wounded but nevertheless held the fort. For his defense of the fort, March was promoted to the rank of lieutenant colonel. He commanded the fort at Casco Bay until 1707.

In the spring of 1707, Gov. Joseph Dudley of Massachusetts appointed March to lead the expedition against Port Royal in Acadia (Annapolis Royal, Nova Scotia). March's force of more than 1,600 men arrived at Port Royal on May 26, 1707. The smaller French and Native American forces put up an unexpectedly successful defense, and because March had no experience with cannonade and siege warfare, he broke off the attack after 10 days and ordered his men back to their ships. March withdrew to Casco Bay, where Governor Dudley sent him reinforcements with orders to try again. When March proved too indecisive, Dudley replaced him with Colonel Francis Wainright.

On August 20, 1707, some 2,000 men landed in Port Royal again, yet this time the French forces were well prepared and resisted the English invasion. The British withdrew after a 16-day siege and

heavy losses. March permanently lost his provincial command and died in Woodbridge, New Jersey, in July 1712.

Marines

The major naval powers of the 17th and 18th centuries all added soldiers of the sea, or marines, to their naval forces. Marines served in detachments aboard ship, as naval infantry during expeditionary campaigns, and as naval artillerists for coast defense and expeditionary duty. Aboard ship their combat role was to provide small-arms support during ship-to-ship engagements. They also composed the nucleus for ship-to-shore landing parties and spearheaded cutting-out parties and amphibious raids. Among European powers, British marines saw the most action during the colonial wars in North America.

In 1537, Spain became the first European nation to organize marines for naval service. The force expanded in 1704 and reorganized along more modern lines in 1717. At that time the marines became the primary shipboard marksmen and served as artillerists. In addition to participating in numerous campaigns in South and Central America and the West Indies, Spanish marines served aboard warships operating off of the Florida and Carolina coasts. Michiel de Ruyter and Johan de Witt prodded the Netherlands Navy to establish a marine force in 1665.

France also organized marine forces. In 1622, the chief minister to King Louis XIII, Jean Armand du Plessis, Cardinal Richelieu, created 100 *compagnies ordinaires de la mer* to garrison seacoast fortresses. In 1626, they were formed into the Régiment de la Marine, created for naval warfare, but most of its members were lost in a subsequent shipwreck. Reformed in 1635, the French marines underwent a great many changes in title, but they chiefly took part in fighting on land. In 1669, King Louis XIV authorized formation of the Régiment Royal des Vaisseaux, but the principal role for the marines was the protection of naval arsenals. The French troupes de la marine, as they were later known, initially had little connection with French naval forces at sea. In North America, troupes de la marine referred to the provincial regular forces of New France.

Before becoming a great colonial power, England relied on regular infantry regiments for naval service. The contest between England and Spain to dominate the West Indies highlighted the need for a specially trained and equipped force to accompany the Royal Navy. Accordingly, at the onset of the Second Anglo-Dutch War in 1664, an Order in Council called for the establishment of a 1,200-man regiment raised and commanded by the lord admiral and paid for out of Admiralty funds. It was called a maritime regiment of foot and was the first large formation to be armed exclusively with firelocks. One detachment went to Virginia in 1676 as part of a bloodless show of force.

The name "marines" first appeared in official records in 1672, but the naval infantry remained part of the British Army until 1755. Whenever war broke out between 1664 and 1755, marine regiments were raised via voluntary enlistment. As soon as peace came, they disbanded. Queen Anne established six marine regiments and six other regiments for sea service in 1702. Each marine regiment comprised 1 grenadier and 11 line companies. Because the marines were formally designated exclusively for sea service, they were included in the complement of men that Parliament voted for naval service. Their combat duties were twofold. First, they acted as small-arms men on board ship. Second, they served in landing parties.

During Queen Anne's War (1702–1713), marines distinguished themselves. Indeed, some 1,900 marines spearheaded the capture of Gibraltar in 1704. Thereafter, they bore the brunt of the first siege. The six marine regiments each contributed 100 men to participate in Colonel Francis Nicholson's expedition to Nova Scotia in 1710. The marines spearheaded the amphibious landing at Port Royal on September 25, 1710, and then assaulted a fort guarding the harbor. Although they demonstrated valor during the assault and siege, they proved less adept at irregular warfare. In one skirmish, the detachment left to garrison lost 70 men to a Native American ambush. Subsequently, in 1711, marines joined Admiral Hovenden Walker's Quebec campaign. Some 208 marines and 20 female camp followers drowned when transports ran aground in the St. Lawrence River.

In 1739, the outbreak of the Anglo-Spanish War (1739–1744) prompted George II to call for the raising of a body of marines. Parliament responded by raising six marine regiments. But such was the lack of trained troops to supply the fleet that Admiral George Anson's expedition to South America had to make do with invalid companies and pensioners, many of whom deserted before Anson sailed. During the war, marines were prominently involved in actions in Europe and the West Indies and were the only British infantry present at the first siege of Louisbourg in 1745 during King George's War.

It was now clear that the Royal Navy had worldwide commitments. Among many, Anson had witnessed the problems caused by the lack of a permanent marine force. Anson argued that what was needed was a specialized force fully trained in fighting both at sea and on land. He urged that they be paid on a regular basis and led by experienced professionals. Accordingly, in 1755, when a new 5,000-man marine force was raised to fight against France (and later Spain), the Admiralty took control and organized it into three divisions stationed at Chatham, Portsmouth, and Plymouth. About half the men had been discharged in 1748, so a large proportion had

to be recruited by scouring the country and offering bounties. In North American waters there were few notable ship engagements. On land, marines participated in the 1758 capture of Louisbourg. Another marine force accompanied Major General James Wolfe's campaign against Quebec, where they garrisoned Wolfe's base on the Island of Orleans and participated in various amphibious diversions that preceded the Battle for the Plains of Abraham in 1759.

By the time of the American Revolutionary War, the permanent marine force had established a reputation for unswerving loyalty. Indeed, a ship captain's ability to impose discipline ultimately rested on his ship's marine contingent. In the larger ships, about one man in every six was a marine. Two marine battalions were sent to Boston in the spring of 1775 to reinforce the garrison. Under the command of John Pitcairn, a marine major, they participated in the march to Lexington and Concord. The success of British marines contributed to the establishment of the U.S. Marines Corps.

Marlborough Garrisons (Massachusetts)

Fortified houses located in Marlborough, Massachusetts. Settled in 1660, Marlborough had a scattered population of some 225 people in 30 houses at the outbreak of King Philip's War in 1675. Some of these buildings, including the meetinghouse, would have been designated garrison houses in order to provide safety for community members in time of attack. The remaining houses would be, in effect, written off. The strategic significance of Marlborough, which lay in the outermost ring of the towns surrounding Boston, was its location at a crossroads on the route to the Connecticut River Valley settlements of western Massachusetts. A "praying Indian" community of native Christian converts known as Okamakemest was also located there.

In August 1675, Samuel Mosley, a local militia captain who despised Native Americans, arrested 16 praying Indians at Marlborough on suspicion of murder. He did so based on the torture-induced confession of one of them. Tied together at the neck, the Native Americans were marched to Boston, where nearly all were acquitted. This event added fuel to the fire of King Philip's War.

In February 1676, Massachusetts chose Marlborough as its main supply base between Boston and the Connecticut River Val-

ley. Food, clothing, and ammunition were deposited there in preparation for an offensive to be led by Major Thomas Savage against the Nipmucks. In March 1676, after Savage and his men had set out, a group of natives, possibly Nipmucks, attacked Marlborough while most residents were in the meetinghouse attending services. The attackers burned 13 houses and 11 barns. They also destroyed fences and fruit trees and killed and maimed cattle. Ephraim Curtis, an Indian trader, and 40 men from Marlborough and Sudbury found the natives' camp that night and attacked it, inflicting an unknown number of casualties.

Although most of Marlborough's inhabitants survived the attack, they abandoned the town afterward. The militia kept its base there, however, owing to its strategic importance. In April, another group of American Indians, having destroyed Sudbury the day before, again attacked Marlborough, destroying most of the remaining houses and driving off cattle. Nathaniel Saltonstall's eyewitness account of the conflict included the note, "Marlborough, wholy [sic] laid in Ashes, except two or three Houses." By spring 1677, however, 27 families had returned to the town.

Maryland

Sandwiched between Pennsylvania to the North and Virginia to the south, Maryland, named for Queen Henrietta Maria (1609–1669), was founded in 1634 by Cecelius Calvert, Second Lord Baltimore. It was intended as a haven for persecuted English Catholics. Calvert's father, First Lord Baltimore, had received a land grant to the area by King Charles I; however, he died in April 1632 and so his son was the recipient of the grant.

The first settlement of Maryland was St. Mary's, established at the mouth of the Potomac River in 1634. The royal charter for the colony granted proprietary powers to Calvert, who was required to follow English law, but was in reality autonomous. The charter allowed Calvert to grant huge estates to colonists. Although the majority of large landowners in Maryland tended to be Catholics, the majority of early colonists were Protestants who either came to Maryland as indentured servants or migrated north from Virginia. Consequently, conflicts between Catholics and Protestants would be an ongoing problem within Maryland throughout the 17th century.

During the English Civil War (1642–1649) and the subsequent reign of Oliver Cromwell as lord protector (1653–1658), the Chesapeake colonies became virtually independent, as the English Par-

Woodcut depicting St. Mary's trading post, Maryland's first settlement, in the early 1600s. (North Wind Picture Archives)

liament and royal officers concentrated on the struggle for power. The Maryland and Virginia assemblies protested the execution of Charles I in 1649, and both voted to recognize his son, Charles II, as king rather than submit to parliamentary authority. By that time, Maryland had a large Protestant majority, including a significant population of Puritans.

Calvert sought to placate the Protestant majority by establishing a bicameral legislature, which passed the Maryland Toleration Act of 1649, assuring freedom of religion for the colony's residents. It was revoked in 1652 by parliamentary commissioners who removed Lord Baltimore as governor of the colony. This action placated moderate Puritans in Maryland but was insufficient to prevent a short civil war within the colony in 1654. Cromwell, for his part, supported Lord Baltimore in the dispute and in 1657 returned his proprietary rights under the 1634 charter, after which the Toleration Act was reinstated. When Charles II was restored to the

throne in 1660, very little effect was felt in Maryland, where Lord Baltimore remained in control. When the Glorious Revolution toppled the Catholic James II in 1688, Protestants in Maryland led by John Coode seized the opportunity to oust the Calverts and make Maryland a royal colony. Maryland was restored to the Calvert family in 1715 after Charles Calvert, Fourth Lord Baltimore, converted to Anglicanism.

Despite the religious turmoil in Maryland, the economy of Maryland expanded rapidly. Like nearby Virginia, Maryland quickly came to depend on tobacco production, as tobacco had quickly become a lucrative cash crop. New colonists poured into the region, both from Virginia and from Europe. The increased labor supply increased agricultural production but also caused the price of land to rise and the price of tobacco to fall.

The close economic similarities between Virginia and Maryland were matched by cultural similarities, including militia systems,

African slave labor, and sometime acrimonious relations with native populations. When in 1675 a minor disagreement between a frontier planter and a party of Doeg natives turned violent, the conflict quickly grew to envelop the frontier settlements of both colonies. When a group of frontier militia murdered 14 friendly Susquehannocks and the colonists made no effort to offer reparations, the Susquehannocks retaliated by attacking settlements in Virginia and Maryland.

By 1675, however, the region's Native Americans had been decimated by disease and internecine warfare, and could not oppose the combined power of the Chesapeake colonies. In September 1675, Virginia and Maryland fielded over 1,000 militia troops. They then marched on a Susquehannock settlement on the Potomac River which had been provided by the Maryland government. The colonists demanded a parley with the leadership of the village. Five Susquehannock chiefs came forth and denied any responsibility for the earlier violence. The militia's response was to murder the chiefs. The militia leaders who ordered the murders were subsequently tried, but none faced significant punishment for their activities.

Maryland and Virginia officials denounced the militia's actions but found little support among the citizenry. As the Susquehannocks pressed the war, reports arrived in the colony of attacks in New England during King Philip's War (1675–1676). Apprehensive frontier settlers began attacking all native tribes in the region, regardless of disposition. When Nathaniel Bacon declared himself the leader of the frontier settlers in their campaign against the natives, openly defying Virginia governor William Berkeley's calls for diplomacy, a de facto state of civil war existed in Virginia. Maryland colonists contributed troops and supplies to both sides in the conflict. Eventually, Berkeley was able to suppress the rebellion, but not until tremendous losses had been inflicted on regional natives.

In the period of colonial wars between European powers, Maryland remained largely untouched by the fighting, with the exception of French privateers occasionally taking prizes in the region. During King George's War (1744–1748), Maryland supplied troops for ill-fated British expeditions against Spanish possessions in Central and South America.

The French and Indian War (1754–1763) commenced with a series of skirmishes between English and French forces in southwestern Pennsylvania. The English colonists involved in the opening combat were led by Major George Washington, who had recruited volunteers in Virginia and Maryland for his 1754 expedition. At the same time, Maryland sent delegates to Albany, New York, to discuss the possibility of a unified colonial plan for defense. Although the delegates agreed to a plan of union, it was rejected by each colonial assembly.

In 1755, a second expedition set forth into the same frontier region visited by Washington the previous year. This consisted of a British and provincial force of more than 2,000 men led by Major General Edward Braddock. It passed through Maryland en route to an attack on Fort Duquesne, near modern-day Pittsburgh. Brad-

dock's force was ultimately ambushed and routed by French and native forces. Braddock was killed in the fighting, and his disorganized forces fled to Philadelphia. Fighting in the frontier region characterized the next two years, including attacks on Maryland frontier settlements. In 1757, the brunt of the fighting shifted to the northern frontier, although attacks in the hinterlands of the Chesapeake colonies continued. Maryland supplied troops, food, and equipment for the British war effort but remained largely untouched by the war.

In the American Revolutionary War (1775–1783), Maryland was sharply divided between Loyalists and Patriots. Maryland supporters of each cause participated in the conflict, although the major campaigns of the war left the state virtually intact.

Maryland, Protestant-Catholic Conflict in

Start Date: 1632 End Date: 1657

The Protestant-Catholic conflict in Maryland originated as an intercolonial territorial dispute that grew into a more pronounced fight over religious authority. The conflict between the colonies of Maryland and Virginia began when King Charles I granted a charter to converted Catholic Cecilius Calvert, Second Lord Baltimore, in 1632. Virginia officials strongly opposed Maryland's charter on grounds that the proposed Catholic colony was an encroachment on vested Protestant territory. The tract of land chartered to Calvert had once been the territory of the London (Virginia) Company. But the land was lost to the Maryland Colony because Virginia became a royal colony in 1624. This enabled the king to grant all or any part of the territory to any party he wished.

The king appointed Calvert's brother, Leonard, the governor of the territory, which promoted security, the rights of conscience, and religious freedom. Immigration to the colony flourished early on, and created problems for William Claiborne, a member of Virginia's provincial council. Claiborne had a license from Virginia's

Allegorical scene of Lord Calvert presenting the document establishing civil and religious liberty in Maryland in 1649. (Library of Congress)

governor to trade with the Dutch in Manhattan and the colonists in Newfoundland. His trading post, however, was located within the boundaries of the Maryland charter on Kent Island, and Claiborne refused to acknowledge Baltimore's authority over the island.

In 1635, Lord Baltimore sent one of his commissioners, Captain Thomas Cornwaleys, to remove Claiborne from the island. Cornwaleys outfitted two large trading pinnaces, the *St. Helen* and the *St. Margaret*. On April 23, in what was possibly the first North American naval battle, they engaged and captured Claiborne's sloop, the *Cockatryce*, with 14 men. In the engagement, 3 men on the *Cockatryce*, including its captain, Lieutenant Ratcliffe Warren, were killed and several others were wounded. The inhabitants of Kent Island remained insubordinate, however, and in 1637–1638, Calvert led a successful expedition against the island, which then submitted to Maryland rule.

The Maryland experiment of religious toleration was further complicated in 1642, when tension between Charles I and Parliament erupted into the English Civil War (1642–1649). While Governor Calvert was in England reporting to his brother, Richard

Ingle, a supporter of Parliament, arrived in Maryland and reportedly cured the colony's royalists. This prompted Ingle's arrest. On his release, Ingle returned to Maryland in 1645 aboard the ship *Reformation* and systematically plundered the colony. At the same time, Claiborne reasserted his claim to Kent Island and Calvert was forced to flee to Virginia. "Ingle's Rebellion," also known as "the plundering time," continued until Calvert raised sufficient manpower to end Ingle's reign over Maryland. Calvert arrived at St. Inigoes Fort in the winter of 1645 and offered a general pardon to all the inhabitants of Kent Island. In return, he asked that they swear obedience to Maryland's proprietor, Cecilius Calvert.

Ingle was only one part of Maryland's problems, however. The colony's third governor, William Stone (appointed in 1648), faced further problems when the Puritan-controlled Parliament in London retaliated against the remaining Chesapeake Bay royalists. The Protestants outnumbered the Catholics nearly three to one, and Stone's administration had only nominal powers in the colony. This created a stalemate between the Catholic faction and the relatively large Puritan population of Providence, situated along the Severn River. Civil war broke out after 1654 when Parliament's Puritan commissioners, Richard Bennett and William Claiborne, assumed authority over the colony's government. They did so by placing restrictions against Catholics practicing their faith and exempting the inhabitants from taking the proprietary oath. Stone reasserted his authority after Oliver Cromwell dismissed Parliament. Stone confiscated provincial records and sent nearly 100 armed men to Providence.

On March 22, 1655, the numerically superior Puritans met Stone's force in battle near present-day Annapolis. In what became known as the Battle of the Severn River, the governor lost nearly half of his men as casualties. Stone and his council were captured and held prisoner for two months, despite negotiations on the terms of release. In late 1657, Lord Baltimore and Bennett settled their differences and the proprietor's authority was restored in the colony. The agreement between the proprietor and Bennett not only settled the issue of colonial authority but also removed Claiborne as the ever-present instigator. That enabled the colony of Maryland to continue with its original aim of providing colonists a haven of religious tolerance.

Mason, John

Born: ca. 1586

Died: December 1635

Founder of the colony of New Hampshire and governor of Newfoundland (1615–1621). John Mason was born around 1586 in England. Little is know of his early life. In 1615, he became governor of Newfoundland, a post he held until 1621.

In 1622, the Council for New England issued a land patent to Sir Ferdinando Gorges and John Mason. It included all the territory between the Merrimack River and Kennebec River, from the coast to the headwaters of the two rivers. Mason, who probably had never visited New England, was convinced that he could create trading posts with Native Americans in the interior along the rivers.

Although his aspirations may have fit the modern notion of entrepreneurship, Mason was decidedly feudal in his dealings, treating settlers as his employees. They were bound only to him and their sole aim was to protect his interests.

In 1623, the Gorges/Mason-owned Laconia Company granted a patent to a small group of men who set sail for the Piscataqua River (New Hampshire). They were led by two London fishmongers, Edward and William Hilton. Mason instructed them to establish a colony that would send fish back to England. The Hiltons settled at Dover Point, a point of land formed where the Piscataqua meets Great Bay. There they began to catch and cure fish. They did not exactly prosper, but they did survive and were in fact able to send provisions to the starving Plymouth Colony.

In 1629, Gorges and Mason divided their properties imprecisely at the Piscataqua. Gorges was to receive all land to the north and east, whereas Mason gained control of all to the south and west. Mason poured money into his colonizing efforts and expanded his area of control. He took firm charge of the organization of his tiny settlements on the Piscataqua and created a command structure. He sent necessary supplies, including the first cattle in English North America, to his employees. But when Mason died suddenly in December 1635 in New Hampshire, his former employees stole his American land holdings.

Mason left two difficult legacies to New Hampshire. First, his grant for New Hampshire was never confirmed by the Crown. Thus the lack of a verified grant created a nightmare of land title disputes that continued over the next century and a half. Second, he instigated long-term animosity between the settlers of New Hampshire and Massachusetts over trade and boundary issues.

Mason, John

Born: ca. 1600 Died: 1672

English-born militia officer best known for leading the assault that destroyed the Pequot settlement on the Mystic River in 1637 (Mystic Fort Fight). John Mason was probably born in 1600 in England. There are few known details of Mason's life prior to his arrival in the New World. He served with English forces in the Netherlands under Sir Horace Vere about 1630, where he held a lieutenant's commission and befriended Sir Thomas Fairfax. Mason arrived in Massachusetts Bay Colony in 1632. There he became a militia officer and was commissioned to hunt local pirates and given responsibility for overseeing the construction of fortifications. At one point he became a representative to the Massachusetts General Court. In 1635, Mason helped found what became Windsor, one of the first English settlements on the Connecticut River.

Following the Native American raid on Wethersfield in April 1637, the Connecticut Colony declared war on the Pequots and appointed Captain Mason to lead its forces against them. Mason traveled down the Connecticut River to Fort Saybrook with 90 English militiamen and 60 Mohegans led by Uncas. The Connecticut General Court had instructed Mason to attack the primary Pequot settlement on the Pequot River, but once at Saybrook, Mason decided to sail to Narragansett Bay and march overland to assault the town on the Mystic River.

Obtaining permission from the Narragansetts to travel through their territory, Mason's force attacked Mystic on May 26, 1637, surrounding the village, setting it on fire, and killing or capturing any Pequots who attempted to escape. As many as 700 Pequots—men, women, and children—perished in the attack. Following the successful campaign, Mason led forces to hunt down and capture other bands of Pequots later that summer. After the Treaty of Hartford subjugated the Pequots to the Narragansetts and the Mohegans in 1638, Mason led another expedition later that year against a Pequot group that was trying to live independently.

Shortly after the Mystic Fort Fight, Mason was promoted to major. In 1660, he was also appointed the colony's deputy governor. Mason lived at Fort Saybrook from 1647 to 1659 and later helped found the town of Norwich. During the Pequot War (1636–1638), Mason established a firm friendship with Uncas. That relationship was a key component of Connecticut's strong support for the Mohegans in later years. From the Pequot War until the end of his life, one of Mason's chief duties was negotiating with local Native American tribes. He died in Norwich, Connecticut, sometime in 1672.

Massachusetts

English colonization of Massachusetts began with the 1620 landing of the Pilgrims at Plymouth. Ten years later, the Puritans established Massachusetts Bay Colony at Boston. The two colonies left important and enduring legacies, including the Mayflower Compact and town meetings as models of self-government, a tradition of public education, the proliferation and dispersal of religious dissidents, and the notorious Salem Witch Trials of 1692. Religious leaders in Massachusetts also ignited the Great Awakening, a mass religious movement that reawakened popular hunger for salvation.

From a geopolitical standpoint, English expansion in Massachusetts spawned additional New England colonies, checked New Netherland's expansion, and drove the indigenous peoples to war. The frontier settlements of Massachusetts bore the brunt of native and French hostility over the course of four Anglo-French

wars. Finally, Massachusetts became the focus of British wrath as it led the colonies to the brink of revolution.

At the time of first contact with Europeans, several thousand Algonquin tribes lived in Massachusetts. In 1620, the Wampanoag sachem, Massasoit, entered into a treaty of friendship with the Pilgrims at Plymouth. The Wampanoags ceded land in the hope of receiving protection from their longstanding enemies, the Narragansetts.

English population growth took off during the 1630s with the arrival of thousands of Puritans. They settled the Atlantic Coast from Maine to Long Island and inland along major rivers. Ignoring Dutch claims on the region, they founded several towns in Connecticut. Under Gov. John Winthrop, the Puritans organized an efficient government and pursued their goal of creating a Puritan society. Increasing numbers of colonists began to chafe under the restrictive yoke of Puritanism, however. Religious thinkers such as Roger Williams and Anne Hutchinson became leaders of dissident religious factions. Indeed, Massachusetts banished all such "heretics" and thereby compelled the exiles to found new settlements.

As the English population encroached on native lands, an exchange of provocations led to war with the Pequots of Connecticut.

Faneuil Hall, meeting- and marketplace in Boston since 1742. (National Archives)

The war culminated in the May 26, 1637, massacre of a Pequot village on the Mystic River by a 150-man force of New Englanders, Mohegans, and Narragansetts led by Captain John Mason. After the slaughter, the Massachusetts government divided up Pequot land among Puritan colonists.

Puritan doctrine left its adherents free to pursue wealth, and the growing colony prospered. Although the majority farmed, others turned to fishing, timbering, and oceangoing trade. Boston merchants sold fish, grain, lumber, horses, and cattle to West Indies planters, and Massachusetts trading vessels transported slaves from Africa to the West Indies. At the same time Puritan missionaries, notably Rev. John Eliot, worked to bring Christianity to the Native Americans.

In 1675, Massasoit's heir, Metacom—known as King Philip to the English—responded to English encroachment by organizing a native confederacy to resist English expansion. In June, Puritan executions of three Wampanoags ignited King Philip's War. Native forces attacked more than 50 New England frontier settlements, destroying 12. Settlers abandoned their homes and fled eastward. Failing to find their highly mobile attackers, New Englanders turned their wrath on convenient targets. These included the "praying towns" inhabited by Christian Native American converts. This ultimately drove many into the enemy camp.

During the winter of 1675–1676, the surviving natives continued to raid, even striking within 20 miles of Boston. As spring approached, the natives confronted starvation, and by June 1676 they began to surrender. A force led by Benjamin Church killed Metacom in August 1676. The war cost an estimated 1,000 English and 3,000 Native American lives. The few American Indians who escaped death or slavery took refuge beyond the English frontier. Many later assisted the French in prosecuting a series of wars against the English.

With the natives largely subjugated, the Massachusetts populace resumed its pursuit of trade and wealth. But widespread defiance of English trade laws goaded King Charles II to act. In 1679, he divested Massachusetts of New Hampshire (although Maine remained under Massachusetts authority until 1820), and in 1684 he revoked the Massachusetts Bay Colony's charter. Then, in 1686, King James II subsumed all the New England colonies under the short-lived Dominion of New England with Sir Edmond Andros as governor and the appointed Governor's Council, but no elected assembly. The resulting discord would lead colonists in Massachusetts to topple Andros after they received news that James II had been overthrown in the Glorious Revolution. In 1691, King William III merged Plymouth and Massachusetts Bay into one royal colony. This period of turmoil was a contributing factor in the Salem Witch Trials of 1692.

New France and its American Indian allies took advantage of the upheaval in Massachusetts to attack the colony's frontier during King William's War (1689–1697). In May 1690, the French burned a coastal settlement and slaughtered more than 70 men, women, and children. Also in May, Massachusetts sent 14 vessels and 700 men, under the command of William Phips, against Port Royal,

Acadia. The mission's success encouraged Massachusetts to send Phips to Quebec with 34 ships and 2,000 men. The October 1690 attack failed dismally. Raids against frontier settlers continued until the peace of 1697.

The outbreak of Queen Anne's War in 1702 brought another decade of frontier violence. After the costly French-Abenaki raid on Deerfield, Massachusetts, in February 1704, Colonel Benjamin Church led an unsuccessful 600-man expedition against Acadia in May 1704. Three years later, more than 1,500 New England militiamen and seamen led by Colonel John March again sailed for Port Royal. The May 1707 expedition also ended in failure. Finally, a joint New England–British expedition captured Port Royal, and with it Acadia, on October 2, 1710. Massachusetts troops also joined the disastrous August 1711 British expedition against Quebec.

Massachusetts would play a leading role in 18th-century conflicts. Dummer's War (1722–1727) took place as the French and the Abenakis sought to prevent English expansion into Maine. William Shirley became governor of Massachusetts in 1741, and during his 17-year tenure promoted Massachusetts involvement in British wars. More than 400 Massachusetts men died during the 1741 expedition against the Spanish at Cartagena during the Anglo-Spanish War (1739–1744). Massachusetts men made up most of the 4,000-man force of New England soldiers in William Pepperell's expedition, which captured Louisbourg in 1745 during King George's War (1744–1748). Although no significant fighting took place on Massachusetts territory during the French and Indian War (1754–1763), nearly 8,000 Massachusetts men participated in the Nova Scotia, New York, and Quebec campaigns.

The peace of 1763 brought the demand that Britain's colonies assume the costs of colonial defense. The 1764 Sugar Act hit hard at Massachusetts merchants, and the colony's political thinkers saw that a precedent had been set for future taxation. Passage of the Stamp Act followed in 1765, resulting in the sacking of Lt. Gov. Thomas Hutchinson's house by the Sons of Liberty, along with other acts of protest. As Parliament in London continued to impose taxes, such as the Townshend Duties, Massachusetts approached the other colonies to organize joint congresses and boycotts of British trade. The presence of naval patrols offshore and British regulars on land created a volatile situation in Boston, leading to the shooting deaths of five civilians on March 5, 1770, in the incident that came to be known as the Boston Massacre.

Revolutionary events gathered momentum with the tax protest of December 16, 1773, called the Boston Tea Party, and Parliament's passage of the punitive Coercive Acts in 1774. In defiance of the acts, the Provincial Congress of Massachusetts continued to meet, while militiamen mustered and towns stockpiled arms. In April 1775, General Thomas Gage, royal governor of Massachusetts, ordered his regulars to march on Lexington and Concord and seize their stockpiles. The opening battle of the American Revolutionary War took place when the British regulars confronted a small force of Minutemen on Lexington Common on the morning of April 19, 1775.

Massachusetts Bay-Pequot Treaty

Event Date: November 1634

Failed peace agreement between the colonists of Massachusetts Bay and the Pequot natives. In October 1634, the Pequot Nation sent an envoy to the Massachusetts Bay Colony in hopes of concluding a treaty of friendship and securing protection against their enemies, the Narragansetts. The colonial leaders received the envoy's gifts but refused to negotiate with him because they held he was not of sufficient rank. The colonists then told the envoy to summon Pequot sachems (chiefs) for a conference. They also demanded that the Pequots produce the murderers of Virginia merchant ship captain John Stone, who had been killed with his crew in the spring of 1634 while trading along the Connecticut River. Certainly, the leaders of Massachusetts Bay used Stone's death as a bargaining advantage. This was ironic, as Massachusetts had earlier charged Stone with adultery, fined him, and threatened him with death should he ever return to that colony.

In November 1634, two Pequot sachems arrived in Massachusetts Bay. Producing a large amount of wampum, they persuaded the English to offer it to the Narragansetts on their behalf. The Pequots also offered the English Connecticut lands for settlement hoping to establish a buffer between themselves and the Narragansetts. The English, fearful of a Narragansett-Dutch alliance against them, hoped to establish peace and accepted.

The English still insisted that the Pequots turn over those natives involved in Stone's murder. The Pequot emissaries explained that Stone had kidnapped two natives to serve as guides and that Stone and his crew had died during an attempt to rescue the two kidnapped natives when gunpowder had accidentally blown up aboard the ship. The Pequots also stated that the Dutch had already killed

the grand sachem, Tatobem, leader at the time of Stone's death. The emissaries also claimed that all but two of the Pequots involved had since died of smallpox. On English insistence, the Pequot negotiators agreed to hand over the two who remained and to pay a large indemnity in pelts and wampum. Because of the excessive treaty demands, however, the Pequot council refused to ratify the treaty.

The pretense of Pequot noncompliance with the treaty was the excuse for a Massachusetts Bay expedition against them, led by John Endicott in 1636. This expedition began the Pequot War (1636–1638).

Massasoit

Born: ca. 1590 Died: 1661 or 1662

Grand sachem of the Wampanoags of New England. The name Massasoit is actually a title meaning "grand sachem" or "great leader" bestowed on Ousa Mequin (Yellow Feather), sachem of the Pokanoket and the grand sachem of the Wampanoag Confederation. Little is known about Massaoit prior to his contact with the Plymouth Colony in 1621. He was born about 1590 in Montaup, a Pokanokets village near present-day Bristol, Rhode Island, and rose to leadership over eight large villages.

The first documented contact of Massasoit with the English occurred in 1619. In that year, he met with Captain Thomas Dermer following the latter's voyage with Tisquantum (Squanto) to New England. William Bradford, the second governor of Plymouth Colony, described the Pokanoket sachem as "a very lust [sic] man in his best years, an able body, grave of countenance, and spare of speech: In his Attyre, a little or nothing differing from the rest of his followers, only a great Chaine of white bone beades about his neck. . . . His face was painted with a deep red like mulberry and he was oiled both head and face."

Traditionally, Massasoit is remembered for his alliance with the Pilgrims and his efforts to aid the Plymouth Colony. There is no doubt that he was a calculating and skilled diplomat. He established personal relationships with the principal leaders of the Plymouth Colony, including William Bradford and Edward Winslow. Concern over the possibility of conflict with the neighboring Narragansetts led Massasoit to forge an alliance with the colonists at Plymouth in March 1621. The resulting treaty was mutually beneficial, providing security for the colonists and military aid for the Wampanoags in

Chief Massasoit of the Wampanoags and some of his warriors, shown here at a meeting with colonists. (Library of Congress)

case of hostilities with the Narragansetts. Cemented even further by Edward Winslow's resuscitation of the critically ill sachem in 1632, the alliance also served to keep the Wampanoags out of the Pequot War (1636–1638) and enabled Massasoit to resist Puritan efforts to Christianize his people.

Expanding English settlements around Massachusetts Bay brought pressure on Massasoit to cede land to the English. To this he relented, selling land in the 1650s to the colony in exchange for the maintenance of harmony. Until his death in 1661 or 1662, the Wampanoag bands under Massasoit and the colonists of Massachusetts Bay and Plymouth remained at peace. Continued encroachment on Wampanoag lands, however, would lead Massasoit's son, Metacom, known to the English as King Philip, to launch King's Philip's War in 1675.

Mather, Cotton

Born: February 12, 1663 Died: February 13, 1728

Puritan leader and minister who played a leading role in the transition from extreme religious orthodoxy to a more secular outlook in New England. Cotton Mather was born on February 12, 1663, in Boston, Massachusetts. Entering Harvard College at age 12, he graduated in 1678. Fearful that his habit of stammering would interfere with his preaching, he studied medicine for a time before earning his master's degree from Harvard in 1681. By 1680, he had overcome his stammer sufficiently to begin preaching. Five years later, he was ordained and joined his father Increase Mather in the pulpit of the Second Church of Boston, holding that position until his death.

Cotton Mather, a prominent Puritan leader who played a leading role in the transition from extreme religious orthodoxy to a more secular outlook in colonial New England during the late 17th and early 18th centuries. (Library of Congress)

As minister of one of the largest churches in Boston, Mather earned a reputation for pastoral care. He was the first American minister to organize clubs for young people, and he began the practice of making regular calls on elderly and ill church members and on prisoners. He also helped establish a school for the education of slaves and organized efforts to build churches in poor communities, to provide relief for needy ministers, and to establish missions among the Native Americans.

Mather's role in the Salem Witch Trials of 1692 has been much debated. He believed in diabolical possession, and his book *Memorable Providences*, *Relating to Witchcrafts and Possessions* (1689) and two other works on the subject, probably helped contribute to the witchcraft hysteria. Yet at the time of the trials, Mather urged the judges not to overuse "spectral evidence" (whereby witnesses claimed to see specters of accused witches) and advised punishments milder than execution. Nevertheless, he gave his full support to the proceedings and he later defended them, most notably in his book *Wonders of the Invisible World* (1693). Yet in his most famous work, *Magnalia Christi Americana* (1702), a monumental ecclesiastical history of New England, Mather presented the Salem Witch Trials as having unjustly condemned to death many innocent people.

After 1692, Mather's influence diminished somewhat because of the trend away from Puritan dominance and because of his own hot temper and arrogance. Although he had hoped to follow in his father's footsteps as president of Harvard, Mather was denied this honor. In 1703, when the lower house of the Massachusetts legisla-

ture, consisting largely of religious conservatives, appointed Mather president, the more liberal upper house overruled it. Thereafter, Mather looked to a new educational institution to be the stronghold of Congregational orthodoxy, persuading Elihu Yale to contribute generously to the project and convincing the governor of Connecticut to name the college after Yale.

Although at the outset of his career Mather bitterly attacked those with differing religious beliefs, he grew more tolerant with time. Also, toward the end of his life, Mather began to expound doctrines that placed him at a distance from the strict Calvinism of his youth and closer to the deism of the 18th century, with its emphasis on a rationally ordered universe and a benevolent God.

An even more prolific author than his father, Mather wrote more than 450 books, cementing his reputation not only as a religious leader but also as a man of letters and a scientist, made evident in *The Christian Philosopher* (1721) and other works. He had a wideranging curiosity about the natural world and saw no conflict between his religious beliefs and science, because, in his view, an understanding of nature was the best cure for atheism. He conducted many experiments of his own and published the results, including one of the earliest known descriptions of plant hybridization. In this, he anticipated Benjamin Franklin, who claimed that Mather's essays had provided the inspiration for many of his own practical devices.

Mather corresponded with some of Europe's leading scientists and was a great admirer of Sir Isaac Newton. In 1712, he became one of the few American colonists to be elected to the Royal Society of London. In 1721, when smallpox broke out in Boston, Mather advocated inoculation, against the protests of most physicians, the general populace, and some clergy. Mather died in Boston on February 13, 1728.

Menéndez, Francisco

Born: ca. 1700 Died: 1772

Former slave who helped found and lead the first community of free blacks in the colonial south (Spanish Florida). Francisco Menéndez was born in West Africa—probably in the Mandingo region—about 1700 and brought to South Carolina as a slave in the early 18th century. By the 1720s, he had escaped bondage and joined with the Yamasees in a campaign against English settlers.

Despite initial successes, the Yamasees and their allies were unable to prevail in the conflict. Menéndez, who had lived for three years among the Yamasees, was among the survivors who sought sanctuary in Spanish-held St. Augustine, Florida. The Spanish colonies had long been a haven for escaped slaves, who were usually granted their freedom if they were willing to embrace Catholicism.

By the time Menéndez arrived in St. Augustine, Gov. Antonio de Benavides was attempting to maintain harmonious relations with the British. As part of his effort, he had ceased granting outright freedom to escaped slaves. Menéndez subsequently became the property of the royal accountant in St. Augustine, Don Francisco Menéndez Márquez, the man whose name he ultimately adopted. It is believed that it was in this position that Menéndez learned to read and write Spanish, which was highly unusual among the enslaved.

Menéndez's military experience with the Yamasees resulted in his appointment to command a slave militia during a series of British invasions beginning in 1727, when Colonel John Palmer led an attack from South Carolina. The slaves mounted a valiant defense of St. Augustine, for which they sought their freedom in compensation. Menéndez unsuccessfully petitioned the governor and the bishop in Cuba for this. A change in the governorship in 1737 brought a reversal of Menéndez's fortune. Gov. Manuel de Montiano was willing to reward loyal service. In 1738, Francisco Menéndez and his followers were granted their unconditional freedom.

Montiano commissioned the creation of Fort Mosé, a settlement for escaped slaves, two miles north of St. Augustine. He appointed Menéndez captain of the new fort and granted him the power to govern the small group of escaped slaves. Fort Mosé became the first all-black, free settlement in the southern part of the continent.

When the British launched a major invasion of Florida in 1740, the population of Fort Mosé was evacuated to the Castillo de San Marcos in St. Augustine. In June 1740, a daring raid, probably led by Menéndez, resulted in the recapture of Fort Mosé. The fort proved too badly damaged to be inhabitable, however. Its citizens thus relocated to St. Augustine for 12 years.

Menéndez's activities in the following decade are not at all clear. In 1741, he was aboard a Spanish privateering ship when it was captured by the British. Menéndez was tortured and taken to the Bahamas, where he was brought before a British court. The tribunal ordered him reenslaved. There is no record of his whereabouts for the next several years, but by 1752 Menéndez was once again in charge of the newly rebuilt Fort Mosé. Whether he was ransomed, had escaped, or had purchased his freedom is unknown.

Fort Mosé was finally abandoned in 1763, when Spain ceded Florida to the British. Menéndez then emigrated to Matanzas, Cuba, taking with him the contingent of freed slaves from Fort Mosé. Menéndez died in Havana, Cuba, sometime in 1772.

Menéndez de Avilés, Pedro

Born: 1519

Died: September 17, 1574

Spanish sailor, soldier, explorer, conquistador, founder of St. Augustine, Florida, and governor of La Florida. Born sometime in 1519 in Avilés, Spain, Pedro Menéndez de Avilés left home at age 14 for a life on the high seas. He excelled as a seaman and garnered a notable reputation while fighting pirates and French corsairs in the Mediterranean. In 1554, the Council of the Indies appointed Menéndez captain general of the Armada de la Carrera de Indias (the Fleet of the Indies). He subsequently safely commanded the convoy of treasure ships from the New World back to Spain. By the time he was 40, he had been promoted to general of the Armada.

Menéndez had an independent streak, however, and in 1563 the House of Trade had him jailed for failure to obey orders. He spent almost two years in prison. On Menéndez's release, however, King Phillip II reinstated him as the captain general of the Fleet of the Indies.

Once reinstated, Menéndez hoped to search for a lost vessel that had carried his son, among other friends and relatives. The king granted him permission to do so. At the same time, the Crown also wanted to reassert Spain's rule over La Florida. In addition to his personal goals, Menéndez thus had official orders to chart the Florida coastline and to explore and colonize the mainland.

To those ends, Philip II named Menéndez governor of La Florida. In the meantime, however, the French had laid claims to the area. In 1562, under French Huguenot Jean Ribault, the French had attempted to establish a colony named Charlesfort (near present-day Beaufort, South Carolina). Although short lived, the settlement laid the necessary groundwork for France's second and more successful colony at Fort Caroline (near present-day Jacksonville, Florida), begun in 1564 under René Goulaine de Laudonnière. When Menéndez set sail for La Florida in 1565, his orders included a command to eradicate the French Protestants from what was now considered a Spanish domain.

Menéndez sailed from Spain in July 1565 with 11 ships and about 2,000 soldiers. Because of storms, however, he arrived with perhaps only 5 vessels and about 1,000 men. The expedition sighted land on August 28, the feast day of St. Augustine. On September 8, 1565, they set up camp ashore just south of Fort Caroline and founded the earliest permanent European settlement in the United States. They named it St. Augustine.

Portrait of the Spaniard Pedro Menéndez de Avilés from 1791 by Francisco de Paula Martí. Menéndez established the St. Augustine settlement in Florida. (Liibrary of Congress)

Learning of the Spanish plans, Ribault launched a preemptive strike, but his fleet was scattered by a major storm. This left Fort Caroline virtually undefended, and Menéndez and 500 men marched overland to destroy it. On September 21, 1565, they razed the fort and killed the majority of the French colonists. Marching back to St. Augustine, the Spanish discovered Ribault's shipwrecked soldiers and massacred them as well, thus ending the French presence in La Florida. When Ribault was found with the aid of Native Americans, he too was killed.

As Florida's first colonial governor, Menéndez explored and colonized along the coast as far north as the Chesapeake Bay, affirming Spanish rule over the entire Southeast of North America. In addition, he was largely responsible for establishing relations with the local natives and creating the mission towns to convert them, both of which allowed La Florida to flourish for over 150 years.

Menéndez returned to Spain in 1567 to recruit more settlers. Despite remaining governor until his death, Menéndez returned to Florida only once, briefly in 1571. On his return to Spain in 1572, he was the favored candidate to lead the Spanish Armada in a planned assault against English forces. However, Menéndez died in

Santander, Spain, on September 17, 1574, before the expedition could begin.

Mercantilism

Mercantilism was the economic system that dominated European commerce and trade from the 1600s to the late 1700s. It was based on the idea that nations would gain a favorable balance of trade by exporting more than they imported. The surplus generated from the excess exports could then be used to enhance a nation's power by developing a more powerful military or expanding a country's empire. Mercantilism relied on government policies designed to protect domestic trade, including tariffs, duties, monopolies, and colonialism.

During the early period of exploration, most colonial powers sought to increase their national wealth through the accumulation of precious metals, mainly gold and silver. An early economic theory known as bullionism argued that a nation's economic prosperity could be measured by how much gold or silver that state possessed. A principal new source of gold and silver was found in colonies in the Americas and Africa. Consequently, states sought to acquire new colonies in these regions.

By the 1600s, however, it became apparent that the simple accumulation of precious metals led to inflation. Even with large stocks of gold and silver, states would have to purchase or import other materials, which would decrease both the stocks of bullion and the value of the precious metals because there would be more in circulation. It then became accepted policy that nations also needed to develop their commerce to maintain a strong economy and increase their share of international trade. This became especially important as those European nations without colonies that exported large amounts of gold or silver were able to dramatically increase their wealth by importing materials like timber, fur, molasses, or tobacco and then exporting manufactured or refined products. By exporting these products, the manufacturing states were also able to acquire more gold and silver. The scramble for colonies with gold and silver subsequently became a race for colonies with valuable raw materials.

In order to discourage imports from rival states, European nations established high tariffs and taxes on imported goods.

Ideally, the nations would be able to secure access to needed materials through their colonies. For instance, by establishing colonies in North America, England was able to get a ready supply of timber and stop importing wood from the Baltic countries. Trade with foreign countries was also restricted in the colonies. Hence the English Parliament enacted the Navigation Acts, which mandated that only English ships could engage in trade with the American colonies and that various raw products such as sugar, cotton, and tobacco could only be exported from the colonies to English ports. Any goods exported to other European states were supposed to be sent first to an English port before being sent to their final destination. Restrictions such as these, in theory, provided the government in London with a near-monopoly on trade with the colonies and a monopoly on certain products, such as tobacco. In practice, however, the English did not adequately enforce the Navigation Acts prior to 1763, resulting in what historians have called "salutary neglect" in that colonies could enjoy many of the benefits of empire without the restrictions.

Beginning in 1699, Parliament enacted a series of laws that tried to restrict manufacturing in the colonies so as to preserve the monopoly on manufactured goods for companies in Great Britain. The government even attempted to restrict trade between the colonies. For instance, in 1732 Parliament passed the Hat Act, which forbade the sale of hats between colonies and forced the territories instead to import quality hats directly from companies in Great Britain. Various governments even put rules in effect that prevented skilled tradesmen or artisans from immigrating to other nations in order to prevent rival states from gaining any economic advantage. In order for the mercantilist system to function, nations needed colonies to act as both exporters of raw materials and importers of finished products from the mother country.

The competition for colonies and disputes over trade practices led ultimately to a series of wars. Between 1652 and 1674, there were three Anglo-Dutch wars over trade and colonies. These conflicts helped expand English control in North America. For instance, the Dutch turned over New York after the Second Anglo-Dutch War (1664–1667). After the Dutch surrendered New York, the English, French, and Spanish became the main adversaries in the fight over colonies in North America.

To import and export goods and products, nations had to build large merchant fleets. Furthermore, the need to protect existing colonies and to acquire new colonies reinforced the necessity for nations to maintain large and powerful navies. The construction and maintenance of the fleets was expansive, prompting states to seek even greater wealth in order to pay for the naval forces. In France, Jean-Baptiste Colbert, controller general of finance under King Louis XIV, enacted a fee on all ships entering French ports. The proceeds from this were then used to fund naval construction. In addition, the cost of military campaigns grew increasingly expensive as wars that began in Europe became global conflicts involving far-flung colonies. Following the French and Indian War (1754–1763), Great Britain in particular sought to recoup some of the costs of the conflict and of maintaining troops in North America from its colonies there.

The myriad tariffs and fees placed on imported goods inflated prices and hurt consumers, who often had to buy more expensive domestically produced items. In addition, government monopolies granted to companies such as the British East India Company also raised prices by eliminating competition. Scottish philosopher Adam Smith pointed out the flaws in mercantilism and in his work *The Wealth of Nations* (1776) was the first to use the term "mercantilist" to describe the system. Smith's emphasis on free trade was shared by many American colonists. In the end, the succession of mercantilist laws and policies enacted by the British government, particularly after 1763, when the British began vigorously enforcing the Navigation Acts, provided one of the chief causes of the American Revolution.

Metacom (King Philip)

Birth: Unknown Death: August 12, 1676

Metacom, also known as Philip, Metacomet, or Pometacom, was the son of Massasoit and sachem (chief) of the Wampanoags (1662–1676). Metacom's precise birth date is unknown, as are the circumstances of his early years. When Massasoit died in 1660, his eldest son, Wamsutta, informed the leaders of Plymouth Colony that he was now sachem. He also asked them to give him and his brother, Metacom, English names. The Plymouth officials drew on

classical history and bestowed the name of Alexander Pokanokett on Wamsutta. They dubbed Metacom, Philip.

Wamsutta's cordial relations with the English ended abruptly in 1662, when rumors that he was plotting an attack on Plymouth Colony began to circulate. Wamsutta temporarily mollified the English, but tensions increased when he contracted an illness shortly after he returned from being questioned at Plymouth and died in early 1662. His death raised suspicions among the Wampanoags. Wamsutta's brother Metacom assumed the role of sachem, and on August 6, 1662, agreed on a pact with Plymouth. The Wampanoags accepted that they were the subjects of the English Crown, and Metacom promised not to break any treaty signed by his predecessors. He also agreed that he would not sell land to "strangers," English settlers deemed unacceptable to the colony, nor would he provoke a war with neighboring native tribes. In return, the colony promised that all settlers would treat the natives as friends and would advise and aid them, presumably militarily. Metacom thought the document was binding for seven years, but he could not read, and in actuality the written document he signed established the terms in perpetuity.

For nearly a decade, Metacom maneuvered to maintain his power and ensure his people's welfare as the English population—and their power—steadily expanded. Wampanoag lands bordered Plymouth Colony, Rhode Island, and the Massachusetts Bay settlement.

Metacom sold tracts of land to various colonists in an attempt to maintain his influence in the politically charged arena, but subsequent conflicts over colonial borders were rarely settled to Metacom's satisfaction. Indeed, colonial courts were biased and unwilling to rule in favor of the Native Americans. The Wampanoags were also angered by colonial efforts to shape native politics, and additional tensions arose as English livestock wandered into Wampanoag fields, destroying crops.

In 1667, the conflict between the Wampanoags and English settlers became more acute when to establish the town of Swansea, Plymouth violated the agreement with Metacom and authorized the purchase of Wampanoag land that was also claimed by Rhode Island. Believing that his earlier agreement with Plymouth had expired, Metacom had begun selling the same land to Rhode Island colonists.

War parties appeared on the outskirts of Swansea in attempts to intimidate the colonists. Plymouth demanded a meeting with Metacom in 1671 and compelled him to surrender his firearms and sign a treaty that bound him to Plymouth's authority, challenging any previous land sales to other colonies. The colony also insisted on a literal interpretation of the treaty, whereby all Wampanoag guns were to be confiscated. Metacom had assumed that only the guns he and his men carried to the signing were to be surrendered. Metacom refused the colony's interpretation, and Plymouth then announced that it would confiscate the guns surrendered and ordered the Wampanoags' allies to disarm as well. Metacom sought assistance from Massachusetts Bay, but found himself confronted by a joint commission from the Bay Colony, Plymouth, and Connecticut, all insisting on strict enforcement of the treaty.

Undated illustration showing Wampanoag sachem Metacom, also known as King Philip, the leading figure of King Philip's War of 1675–1676. (Library of Congrerss)

There is evidence that, at about this time, Metacom sought the backing of other native leaders and peoples, such as the Nipmucks, who felt pressure from the colonists. Metacom also appears to have tried to establish an alliance with the Narragansetts, who were old enemies but the most powerful tribe in the region. Rumors of his efforts reached colonial authorities, and conflict ignited with the death of John Sassamon, one of Plymouth's native informers, on January 29, 1675. Shortly before his death, Sassamon had warned Plymouth officials of Metacom's plans.

The circumstances of Sassamon's death remain unclear. At first, little attention was paid to his death, which may have been accidental, but Plymouth officials became convinced that the Wampanoags had murdered him. By questionable process, the three Wampanoags accused in Sassamon's death were tried in an English court, found guilty, and hanged. But the jury could not determine if Philip had known about or ordered the murder.

In June 1675, a band of Pokanokets again appeared at Swansea, rifling through several abandoned homes and slaying livestock. After the death of one of the Pokanokets, retaliation on the part of both natives and colonists led to the Native American siege and destruction of Swansea. A full-scale native uprising ensued, seemingly sparked more by the rage of the Wampanoags than any plan. Metacom was besieged at his home at Mount Hope (Bristol, Rhode Island) but managed to escape and join with Nipmuck and Podunk allies to attack and burn English settlements west and south of Boston.

King Philip's War had begun. The New England Confederation officially declared war on September 9, 1675. Various Native American groups from the Connecticut River Valley and the Narragansetts joined the uprising after being attacked by English forces, but Metacom was not in formal command. He had left New England in December to seek support from the Mahicans in the upper Hudson River Valley.

As attacks by colonial forces and their native allies became more effective, disease and hunger also took their toll on Metacom's allies. In the spring of 1676, the informal Native American alliance began to disintegrate as many moved north and west to escape the fighting or made peace with the colonies. In June, Mohawks allied with colonial New York attacked Metacom and his forces, killing all but 40 of them and forcing Metacom to return to Massachusetts.

On August 12, 1676, colonial forces surrounded Metacom and his remaining force. That day he was shot and killed just outside Mount Hope by a native serving with colonial forces. Metacom's head was cut off, and his body drawn and quartered and the pieces sent to the colonial capitals. His head was displayed at the fort at Plymouth for the next 25 years. Metacom's uprising decimated the native population of southern New England, and his death marked the end of native independence in the region. The Narragansetts, the Wampanoags, the Podunks, the Nipmucks, and several smaller bands were virtually eliminated, leaving Massachusetts, Connecticut, and Rhode Island fully open to the spread of European colonization.

Miantonomo

Born: Unknown Died: 1643

Key Narragansett leader who played a pivotal role in the history of early New England. Miantonomo (also spelled Miantonomi) presided over the Narragansetts with his uncle Canonicus. There is almost nothing known about the circumstances of Miantonomo's birth and his early years, but he was most likely born in modernday Rhode Island or eastern Connecticut.

The Narragansetts had allied themselves with Rhode Island, a colony that dissented from the Puritan orthodoxy of neighboring Connecticut and Massachusetts. Numerically inferior to the other New England colonies, Rhode Island did not enjoy the support of its sister colonies. However, it did back Massachusetts and Plymouth during the Pequot War (1636–1638) and sought assistance from their Narragansett allies and Miantonomo.

Miantonomo gave advice and military assistance to the English during the conflict. However, he repeatedly admonished them for

Miantonomo, Native American sachem of the Narragansetts, shown after his capture by Uncas, July 1643. Wood engraving, American, 19th century. (The Granger Collection)

their mode of warfare, complaining that they killed too many men and did not take enough prisoners. The Narragansetts saw warfare as a way to intimidate and extract tribute from their enemies, and as a means to acquire captives. For them, warfare was not principally about killing and destruction.

After the war, however, Miantonomo realized that native peoples had to band together to counter the English expansionist tendencies. He argued that rather than thinking of themselves as Narragansetts or as Mohegans, the native peoples had to formulate a common identity. Miantonomo employed imagery of a peaceful, precontact New England in his efforts to convince the natives to band together. Instinctively, New England governments became alarmed when they learned about Miantonomo's pannative activities.

In the 1638 Hartford Treaty, which ended the Pequot War, Miantonomo was granted hunting territory on former Pequot lands. The agreement had also stipulated that the Narragansetts and the Mohegans refrain from fighting. However, the Mohegans under Uncas routinely attacked Narragansett hunters. In accordance with the treaty, Miantonomo informed Massachusetts Bay Colony of his

intent to punish the Mohegans. Given some armor by a colonist, Miantonomo was weighed down and easily captured by the Mohegans during a battle in 1642. While a prisoner, Miantonomo and Uncas discussed the possibility of joining forces. But in the end, Uncas turned Miantonomo over to the Connecticut authorities.

Connecticut officials, however, were not quite sure what to do with the sachem. On the one hand, they wanted to be rid of Miantonomo, regarding him as a troublemaker. Yet at the same time, they did not want his blood on their hands. They handed Miantonomo back over to Uncas. In 1643, with colonial representatives in attendance, Uncas's brother slew Miantonomo, the first Native American to propose a pan-native movement.

Micmacs

An Algonquian-speaking Native American tribe centered in the Gaspé Peninsula, which they called Mi'kma'ki, situated on the eastern tip of the modern-day province of Quebec and immediately to the north of New Brunswick. The Micmacs (Mi'kmaq) at one point commanded a territory that extended to areas of Nova Scotia and Prince Edward Island, the north shore of New Brunswick to the St. John's River, parts of Quebec, eastern Maine, part of Newfoundland, and the islands in the St. Lawrence River. The Micmacs were members of the Wabanaki Confederacy, which was a loose alliance of the Maliseets, the Eastern and Western Abenakis, the Penobscots, and the Passamaquoddys. The area inhabited by this confederacy included much of eastern Canada and northern New England.

The Micmacs may have been the original settlers in the area, arriving not long after the end of the last Ice Age. Since prehistoric times, they lived by hunting and gathering in seasonal movements to available food supplies. Later on, they augmented hunting and gathering by cultivating seasonal crops, although their northern locale made it difficult to pursue agriculture in a significant way. Micmacs worshiped the so-called Great Spirit and passed down numerous religious legends. Many were about a super being named Glooscap, the maker of much of the Micmacs' surrounding landscape.

When the Micmacs first encountered European fishermen (Spanish, Portuguese, and French) in the early 1500s, they did not experience a devastating shock as did many other tribes. For a long time they had held that a spiritual being friendly to the Micmacs had crossed the Atlantic to discover a blue-eyed people. The legend also

said that these new people would one day come from the East to disrupt their lives. Some believe that the legend may have sprung from visits by the Vikings around the year 1000. Despite their friendship with the Europeans, the Micmacs were devastated by European diseases, which reduced their numbers from approximately 20,000 before contact to 4,000 or so by 1620.

The Micmacs sought to trade with the Europeans. They also tried to employ European technologies, especially in weaponry. When the French explorer Jacques Cartier visited Canada in 1534, he initiated Franco-Micmac trading relations. In 1603, Samuel de Champlain also visited the area, and in 1610 Chief Membertou converted to Roman Catholicism. Eventually, French Jesuit missionaries converted most of the Micmacs to that faith.

In 1710, the British captured Port Royal, the center of French Acadia, in an action during Queen Anne's War (1702–1713). The British renamed the town Annapolis Royal. In 1745, during King George's War (1744–1748), the French, based at Louisbourg, tried to retake Port Royal. With the help of French settlers, Micmacs, and the Malisect tribe, they attacked the British garrison. However, coordination between the French forces, who were led by inexperienced commanders, was poor. The resultant piecemeal siege proved unsuccessful. The British expulsion of the French inhabitants from Acadia in the 1750s devastated the Micmacs, who by then had developed tight bonds with the French to include significant intermarriage. The Micmacs fought back by launching repeated raids against British interests in the area.

In the late 1700s, after the French had been expelled from Canada, the Micmacs signed a number of treaties with the British. The Royal Proclamation of 1763 is still the fundamental law between the Micmacs and the Canadian government. During the American War of Independence, the Micmacs sided with the Patriots, mainly because they mistakenly believed that a British defeat would bring back the French. In 1794, the Micmacs signed the Jay Treaty, allowing them to cross the American-Canadian border freely. Most surviving Micmacs live in the Canadian Maritimes, although extensive intermarriage with the French has made it difficult to determine their numbers.

Military and Naval Medicine

Because virtually all naval and military forces operating in colonial North America were of western European origin, their medical care closely mirrored the practices in their home countries. The 18th century was, in fact, the first time that military medicine became a governmental responsibility, a change that can be traced to England in 1660, when King Charles II (1660–1685) created a professional corps of military surgeons. As with their counterparts in the regimental officer corps, military surgeons purchased their commissions, and many functioned both as doctors and as warriors, holding rank in both capacities and collecting salaries in each. A standing army also necessitated screening recruits and housing, feeding, and dressing them in a manner that would promote their health, and all of those responsibilities fell to a lesser or greater extent on the military surgeons.

Professional training in an era when surgeons were separate from and inferior to physicians was a recurring problem. Through much of the 17th century, the Prussian Army drew almost all its medical corps from field barbers, or *feldschurs*, a practice that finally changed during the War of the Austrian Succession (1740–1748), when King Frederick II (the Great, 1740–1786) solicited the help of the French. In the first half of the 18th century, the only place in Europe where surgery was being formally taught was Paris, and the Prussian king approached French military surgeon Louis Petit in 1744 asking for trained surgeons to help educate his military medical corps. His new Prussian physicians established field dressing stations near the front, as well as intermediate level field hospitals and rear area facilities for those with the most severe wounds. They also generally improved transport and care of those wounded in battle.

The Prussians and Austrians eventually established their own schools of military medicine and even published periodicals devoted to military medicine. They promulgated printed regulations for camp sanitation and administration of military hospitals. France had already done much the same under King Louis XIV (1643–1715), who ordered that his army have a regular medical staff chosen by examination and who built military hospitals in 51 French cities where the surgeons were annually required to take and pass courses in anatomy.

The British were slower to change, although by the War of the Spanish Succession (1702–1713) the Duke of Marlborough had issued regulations dealing with health and sanitation for his armies and by the Battle of Blenheim (1704) he had placed collecting stations for the wounded just out of musket range of the front lines. British articles of war mandated that one day's pay a year be withheld from a soldier's wages to pay for military hospitals and that any spoils taken after a battle be set aside for maintenance of the sick and wounded.

In 1752, Sir John Pringle published his *Observations on Diseases of the Army*, which contained rules for sanitation and ventilation of military hospitals and took the radical point of view that cleanliness decreased the rate of hospital-acquired infections. Prior to Pringle's reforms, military hospitals were crowded, poorly ventilated, and filthy. They were, in fact, major sources of infection and death. Typhus, or "jail fever," was recognized as identical to the "hospital fever" that plagued military facilities.

Shortly after the publication of Pringle's book, James Lind's *Hygiene of the Sailors* (1757), Baron von Swieten's *Camp Diseases* (1758), and Richard Brocklesby's *Observations on Military Hospitals* (1764) offered major improvements in military medical care in a time when soldiers and sailors were fed diets almost entirely lacking fruits and vegetables, when water was often drawn from contaminated streams next to open latrines, and when wool uniforms sold to the troops by their officers regularly led to death from heat stroke during summer marches.

By the 18th century, the musket had become the primary weapon of set-piece battles and Frederick the Great had perfected the use of close-range, coordinated volleys in which opposing forces lined up 200 yards apart and whichever side could load and fire the fastest was likely to win. Since the bulk of training in military surgery was still obtained on the battlefield, treatment of gunshot wounds assumed primary importance during that century. John Hunter, the preeminent English surgeon of the 1700s, obtained much of his experience serving with British forces in the Belle Isle invasion and the Portuguese campaign and returned to write his landmark *Observations on Gunshot Wounds* (1794).

There was still a general belief that gunpowder was, of itself, poisonous and that musket wounds should be cauterized with hot oil and dressed with a variety of salves. The ointments were often the surgeon's closely guarded secret and were never sterile. Wounds

Common Diseases during the Colonial Era

Disease	Cause	Transmission	Symptoms
Dysentery	Bacteria/amoeba	Contaminated food or water	Bloody diarrhea, abdominal pain, blood poisoning, kidney failure
Malaria	Protozoa	Mosquitoes	Fever, chills, joint pain, anemia, kidney failure, coma
Scurvy	Vitamin C deficiency	Lack of citrus fruit	Liver spots, spongy gums, bleeding from mucus membranes
Smallpox	Virus	Person-to-person	Fever, vomiting, rash, pustules
Typhus	Bacteria	Fleas, mites, and lice	Fever, chills, muscle pain, rash, delirium, bleeding into the skin, kidney failure
Typhoid	Bacteria	Contaminated food or water	Fever, chills, weakness, muscle pain, diarrhea, intestinal hemorrhage
Yellow fever	Virus	Mosquitoes	Fever, muscle ache, vomiting, jaundice, kidney failure

were usually probed with unsterile instruments in an effort to extract any foreign material and were then washed with antiseptics such as mercury based corrosive sublimate, chalk, camphor, myrrh, or hot turpentine. They were then typically packed with charpie (unraveled linen cloth) soaked in wine or brandy. Needless to say, infection was the rule rather than the exception and was so common that production of "laudable pus" was viewed as an essential phase of healing.

The most common operation performed by military surgeons in the 18th century was amputation. It was a routine remedy for not only gangrene but also serious trauma that defied easy repair, injuries to major vessels, and open fractures or penetration of a joint.

Naval medicine was, like its land-based counterpart, a combination of health maintenance composed mostly of sanitary and dietary considerations and wound surgery. Although James Lind had demonstrated in 1747 that scurvy could be prevented by regular intake of citrus juice, the disease remained the plague of sailing ships because the Royal Navy did not mandate citrus supplements until 1793. Diseases such as typhus, smallpox, yellow fever, and dysentery were fostered by close quarters, poor hygiene, unsanitary food and water, and visits to areas where infectious agents were endemic. Ships were notoriously dangerous places in which to work, with injuries quite common as a result of falls from rigging and blows from heavy tackle. Drowning was a frequent problem, which was compounded by the fact that a majority of seaman could not swim.

The sick and wounded were typically housed in the forward area of the ships' gun decks. That deck was divided by the vessel's ribs into bays. Those bays in the main part of the ship contained guns, whereas those in the bow, where hammocks were hung for the patients, came to be known as "sick bays." During battle, the ship's surgeon set up shop below the water line, where he and his patients were less likely to be struck by cannon balls. Surgery was performed on chests laid side by side in the cable tier or orlop deck beside barrels for wash water and for collecting amputated body parts. Ships' boys, called "loblolly boys" after the porridge they delivered, were responsible for feeding and washing the sick and injured and for mopping the blood that accumulated around surgeries.

Because they shared in prize money, victories at sea might enable ships' doctors to become relatively prosperous. In addition, many naval surgeons, such as Carl Linnaeus, Sir James Hooker, and, later, Charles Darwin, doubled as amateur naturalists.

Physicians and surgeons were among the first colonists in both Massachusetts and Virginia. John Winthrop brought a barber surgeon to the Massachusetts Bay Colony in 1645, but the man left after three years, complaining he was unable to make a living. Jamestown had a surgeon general (Thomas Wooten) in 1607, and two doctors, Walter Russell and Anthony Bagnall, served with John Smith in 1608. Wooten treated Smith for an injury and a local Indian for a gunshot wound that year, but both returned to England in 1609 so that when Smith was injured by exploding gunpowder, he had to return to London for treatment.

Samuel Fuller came to Plymouth on the *Mayflower* as surgeon to the colony, although he probably lacked a medical degree. In one of the few instances when Plymouth and the Massachusetts Bay Colony cooperated, Fuller helped treat an outbreak of scurvy in Charles Town (present-day Charleston, South Carolina). Fuller died of fever in 1633. In 1636, Plymouth Colony did pass a law requiring that veterans injured in Indian wars be supported for life. Virginia and Rhode Island followed with provisions for lifetime half pay for disabled soldiers.

Still, for much of the 17th century, American colonists were forced to rely on their own resources, on ministers doubling as medical practitioners, or on doctors from passing ships for the majority of their care. As late as 1775 and the coming of the American Revolutionary War, there was still a dearth of trained physicians and surgeons in the colonies. On May 8 of that year, the Provincial Congress of the Massachusetts Bay Colony authorized a committee of physicians to examine the qualifications of potential military surgeons. What they found was primarily a collection of men trained by apprenticeship with little more than knowledge gained by practice. Although the Continental Army medical corps was formalized after the Battle of Bunker Hill in 1775, medical care in the colonies remained well below European military medical standards throughout the war.

Militias

Militias, or organizations of citizen soldiers, formed the principal military force in North America during most of the colonial period. The systems that evolved in the French and English colonies were very much the same in that, with few soldiers available, for the most part the colonists themselves had to look after their own defense. As the colonies were founded, most established similar compulsory militia systems, although the militias varied in exact requirements and composition from colony to colony.

In New France, a militia (*milice*) was organized in Trois-Rivières in 1651, and another, the Milice de la Sainte-Famille, came into being at Montreal in 1663. These early militia formations were ad hoc, localized, and short-lived organizations. To compensate for the departure from New France of the French Army's Régiment de

Carignan-Salières, King Louis XIV ordered in 1669 that the adult French Canadian male population be formed into a formal militia. The organization devised by the French governors during the early 1670s continued with few structural modifications until the very end of New France.

In theory, every able-bodied man aged 16 to 60 in New France was expected to serve in the militia, but as in the English colonies, certain groups were excluded, among them the clergy, the nobility, and civil servants.

The governor general of New France commanded the militia. Colonels, majors, and *aide-majors* (adjutants) were all appointed by the government and drawn from among the bourgeoisie. In rural areas, militia companies generally corresponded to parishes and were commanded by captains, assisted by lieutenants and sergeants. Company officers were drawn from among local notables and during peacetime were part of the civil administration. In Quebec, Montreal, and Trois-Rivières, the companies roughly corresponded to the various administrative wards. As these cities developed their own civil and judicial administration, the functions exercised by the urban militia officers became strictly military. Government guidelines required that each company undergo periodic drill, but there is little evidence that this was followed in practice.

Throughout the colonial period, the administrators of New France stated emphatically that the militia formed the colony's primary military force. Because of the small French population, the militia of New France was correspondingly small. On paper that of Canada numbered approximately 2,250 men in 1683, 4,000 in the first decade of the 18th century, some 8,000 during the 1740s, and between 10,000 and 12,000 during the 1750s. Only a fraction of that number could actually be deployed at any time, however, without crippling the economy and logistic support of operations. Because of New France's continued reliance on Native American warriors, relatively few militiamen ever became expert woodlands guerrilla fighters. During the field battles of the French and Indian War (1754–1763), notably on the fateful Plains of Abraham at Quebec, militia were also shown to be extremely poor conventional combatants.

In the colonies of Acadia, Île Royale, and Louisiana, the militia establishment was even smaller and far less significant militarily than in Canada, owing to the smaller French population. It also appears that in these locations, militia officers never held civilian administrative posts.

In the English colonies, the militia tradition rested on a precedent that reached back before the Norman conquest. England, an island nation, counted on its navy rather than a standing army to provide defense against attack. This lack of a strong standing ground force had a pronounced impact on the development of English, hence American, political institutions. Unable to rely on a military establishment to enforce their will, England's kings had to rule with the rough consent of the governed. Indeed, the English people came to view a standing army as a threat to liberty, particularly given the mid-17th-century military dictatorship of Oliver

Cromwell. The Bill of Rights imposed by Parliament on William and Mary in 1689 after the Glorious Revolution prohibited standing armies in the realm in time of peace.

In England, all freemen between the ages of 16 and 60 were required to bear arms in defense of their country in the event of foreign invasion. The professional British Army, even in modern times, remained small and was accepted only grudgingly by the English people. The Royal Navy was another matter altogether. It was regarded as essential to national defense.

In English America, a militia system suited colonial needs not only because it seemed logical but because the colonials had the traditional fear of a strong standing army as an instrument of tyranny. One of the articles critical of King George III in the 1776 Declaration of Independence accused the crown of keeping "among us in times of peace" standing armies without the consent of the colonial legislatures.

British, French, and Spanish colonists in North America more often than not found themselves largely left to their own devices as far as defense was concerned. The European governments generally provided some weapons and munitions and limited naval protection. Only occasionally did the mother country send out large contingents of regular troops, and then only at the end of the colonial struggle.

Because of the threat of Native American attack, militias were established early in the colonies. In 1632, the Virginia Assembly instructed every man fit to carry a firearm to bring it to church so he might drill with it after services. The heart of the militia system was the militia company. In northern colonies, militia companies were organized by town or groups of neighboring towns. In the south, with its widely scattered plantations, militia companies were organized on the county level.

Approximately 60 men made up a company. Militia companies trained together and could, in theory, fight together, but rarely did so. Whenever an offensive expedition was needed, men from different militia units were drafted into composite companies for the attack, thus leaving a defensive force in place in each town. Militiamen also served on local watches, especially in times of war or unrest. Some of the colonial militia systems in the lower South, especially in South Carolina, with its massive imbalance of enslaved Africans to free whites, were occupied more as slave patrols than units of military defense.

Militiamen were almost exclusively infantry. Initially, two-thirds were armed with muskets and one-third with the pike. The latter weapon was of little use in forest warfare and by the end of the 17th century had largely disappeared from the North American battlefield.

Massachusetts was the first to establish militia cavalry units, known as troops, in 1652. Virginia did so in 1661. Cavalry forces, because of the heightened cost of upkeep on equipment and horses, often limited their membership to men of a certain status or income. Such cavalry troops were employed chiefly in reconnaissance and communication duties.

Most colonies required compulsory militia service. With the exception of certain civil servants, apprentices and indentured servants, and ministers, all able-bodied males between certain specified

ages, usually 16 and 60, would be enrolled in the local militia. Every colony had a compulsory training law, except Quaker-influenced Pennsylvania, which nevertheless had a voluntary militia. Most colonies specifically excluded African Americans from militia service, but some only excluded slaves.

Individuals reporting for militia duty had to provide their own equipment, ammunition, clothing, and provisions. In colonial times, weapons were considered essential to protect against hostile Native Americans and to shoot game for food. Still the maintenance of weapons and necessary equipment could be a considerable expense and apparently, at least in the more established urban areas late in the colonial period, there was frequent borrowing of equipment at inspection time.

Militias were required to assemble whenever there was an emergency. Training included weapons' inspection, practice firing, and moving as a unit. In the early days of settlement, when fears of native attack ran high, militiamen trained more frequently. Massachusetts forces trained every Saturday in the early days of the colony. This was a burden on the men, who were busy establishing farms, and training days were cut back as soon as the threat of native attack eased. In most colonies, especially as time passed, militia training days, which dwindled to eight days a year or even fewer, became little more than community social gatherings, with the men firing a round or two before adjourning to the local tavern. This wreaked havoc on military preparedness.

On occasion, militia companies trained with other units, but only rarely as combined arms, since there were few cavalry companies and even fewer artillery units. Generally speaking, in the course of the 18th century, militias became more social than military organizations.

Civilian control of the military was a deeply embedded tradition in the English colonies. The Virginia Bill of Rights minced no words on this matter, stating that "in all cases the military shall be under strict subordination to, and governed by, the civil power." The colonial assembly exercised control, although in practice it delegated this authority to the governor, whose commission in royal colonies made him commander in chief of his province's military forces. Traditionally, he appointed the colonels who commanded the colony's military districts. In the northeastern English colonies, company grade officers were elected by the men, a practice inherited from the English that nonetheless tended to select the natural leaders. In the rest of the colonies the colonial governors appointed the company officers. Generally speaking, most officers came from the upper classes. Company officers appointed the noncommissioned officers of sergeants and corporals.

There were no logistics services or permanent staff officers. Militiamen were expected to provide their own supplies for the campaign, which against the Native Americans were usually only a matter of several days. If operations were longer, the colonial legislature would take over this function.

Some colonies had elaborate militia command structures. Massachusetts became the first English government to establish regu-

lar, permanent regiments in 1636, and Virginia instituted an extensive system of military districts.

In an emergency, individuals might be impressed, levied, or drafted in their militia companies for active service. In most cases, however, one could secure exemption from this by a fine or providing a substitute. In colonial wars the militia would be paid and supplied, often armed and clothed, by the governments.

As the English government and especially the British Army became more involved in fighting in America in the 1740s and 1750s, the colonial militia slowly evolved into a ready reserve force. Large, volunteer provincial armies made up of marginal men and young men looking for adventure, cash, and freedom from their families were raised to accompany British offensive expeditions against French Canada, instead of producing composite companies out of the militia itself. It was from these individuals, usually the dregs of colonial society, that the British gained their low opinion of colonials as poor fighting men. By the end of the French and Indian War (1754–1763), the militia had become, at least in the older, settled colonies, a community association with minimal emphasis on military matters. Instead, it was an institution that granted social status, but which did not instill any confidence in its military prowess.

Militarily, colonial militias remained an indifferent lot with a decidedly mixed combat record. They often responded slowly in a crisis and colonial authorities learned early on that they were ineffective in being able to prevent surprise attacks by Native American forces. Governments learned that the natives would very likely get in the first blows and that the militia was best used in counterattacks, especially to destroy native settlements and their means of livelihood. Militia forces adopted native tactics—the so-called skulking way of war—and proved remarkably successful in mounting their own hit-and-run attacks on native villages. French and English militia units generally fought fiercely and well against one another. There are, however, many examples of militia units being destroyed through lack of awareness, overconfidence, poor training, or simple poor leadership.

Although the militia was useful for certain roles during the American Revolutionary War, it could not stand up to regular units in pitched battle. Continental Army commander General George Washington dismissed the militia as a "destructive, expensive, and disorderly mob" and after the war pleaded for a standing army as alone able to fight a "modern war." His call went unanswered, and militias continued to be the principal military defense of the United States well after the War of 1812. Indeed, the Second Amendment of the U.S. Constitution was adopted to ensure a ready supply of weaponry for military service: "A well regulated Militia, being necessary to the security of a free state, the right of the people to keep and bear Arms, shall not be infringed." The tug and pull between a citizen militia and regular army continued as a major theme in U.S. military history.

Mingos

Native American nation originally inhabiting a broad area of what is now New York State who then settled in present-day Ohio and western Pennsylvania. The Mingos were often a participant in the imperial conflicts of the 18th century. They unsuccessfully jockeyed for advantage amid competing French, British, and colonial interests in North America.

Their name derived from *mingwe*, an Algonquian term meaning "stealthy" or "treacherous," but the Mingos were less a distinct tribe than a multicultural grouping. Included among them were refugees from the Seneca, Wyandot, Shawnee, Conestoga, and Delaware tribes. By 1740 they were inhabiting western Pennsylvania, part of the Great Lakes region that the French called the Pays d'en Haut, or "upper country." In this borderland between colonial empires, otherwise minor tribes loosely allied themselves with one another for mutual strength. They shared an identity and sense of mission separate from that of their powerful neighbors in the Iroquois Confederation.

By 1750 the Mingos, the Delawares, and the Shawnees of the upper Ohio River Valley arranged an alliance known as the Covenant Chain. According to diplomatic agreements, the Mingos were regarded as "brothers" of the British and "nephews" of the Iroquois Six Nations because the latter had been granted the role of spokesman for other tribes aligned with the Crown. But in 1751 the bonds of the Covenant Chain were threatened as the Ohio Company of Virginia established a presence in the region to challenge claims by the French and the Native Americans. A series of events then began that would spark the French and Indian War (1754–1763). Lt. Gov. Robert Dinwiddie of Virginia sent Major George Washington

into the disputed area in 1753. Dinwiddie assigned Washington the unfamiliar role of emissary to deter the French from expanding their operations. Although the Mingos would generally support the French in the forthcoming conflict, a sachem (chief) known as Tanaghrisson, or Half-King, acted independently to assist Washington. Guided by Mingo warriors, the British surprised the French at Jumonville's Glen in 1754 and, though it is uncertain who initiated combat, defeated them.

The Mingos massacred wounded prisoners and Washington placed his troops in front of the remaining French soldiers to guarantee their safety. Tanaghrisson, desperate to assert himself as a figure worthy of British support, executed the French commander only to die shortly thereafter from what some attributed to "French witchcraft." The conclusion of the war forced the Mingos to migrate westward into Ohio.

In 1768, the Mingos rejected the Treaty of Fort Stanwix whereby the Iroquois relinquished much of Ohio to the British. The result was Lord Dunmore's War (1774), in which colonists bested the Mingos and the Shawnees. The Mingos also joined the British in battling Patriot forces during the American Revolutionary War. The triumph of the fledgling United States forced the Mingos from the Ohio Country altogether.

Minuit, Peter

Born: 1580 Died: 1638

Director general of New Netherland, 1626–1633. Peter Minuit was born in Wesel, Duchy of Cleves, in present-day Germany in 1580. His Protestant family had emigrated there to escape religious persecution in the Netherlands, then controlled by Catholic Spain. Named the third director general of New Netherland in December 1625, following the brief terms of Cornelis May and William Verhulst, the enterprising Minuit arrived in New Amsterdam on May 4, 1626.

Three weeks later, on May 24, 1626, Minuit convened various local Native American leaders and purchased Manhattan Island from the natives (perhaps the Camarsees, a Metoac tribe) for goods valued at 60 guilders, reportedly beads, knives, and cloth. A 19th-century writer calculated this to be \$24, a figure that has stuck in

the public imagination. It is highly unlikely, however, that the natives understood that they were ceding all rights to the land in this exchange. In their view, the transaction more likely signified permission to settle there and share the land.

Soon after Minuit's arrival, he oversaw the construction of about 30 small homes, the humble beginnings of what would become New York City. He also oversaw the construction of Fort Amsterdam at the tip of Manhattan.

By late 1626, the colonists had already exported more than 7,000 beaver skins. Minuit was well aware that the tiny new colony would never succeed if it could not attract large numbers of settlers. This was especially true with the English establishing numerous settlements to the northeast. Indeed, the Dutch West India Company wanted an ever greater return from their New World colony. Minuit was permitted to establish the "patroon system," whereby a Dutchman would be given considerable land in New Netherland if he brought 50 settlers with him from Holland.

Despite concerns about the English, Minuit established trade relations with Gov. William Bradford of Plymouth in 1627. No serious skirmishes with local tribes were reported, but when defense against attacking natives became an issue up the Hudson River at Fort Orange (near present-day Albany), Minuit ordered the remaining settlers to withdraw to Fort Amsterdam.

Dismissed from his post in 1632, Minuit was recalled to Holland for an investigation into his use of company funds to build a huge ship, the *New Netherland*. He also had to answer other questions about his administration. Wouter van Twiller replaced him as director general. By the time of Minuit's departure, New Amsterdam had a population of more than 300 people. It had also sent more than 50,000 animal furs back to Europe.

Minuit later returned to America in a new venture. He joined the New Sweden Company in 1637 and arrived in the New World with 50 colonists in March 1638. Minuit helped found New Sweden and oversaw construction of Fort Christina near present-day Wilmington, Delaware. The Dutch saw this settlement as an encroachment on their territory, however. Gov. Willem Kieft of New Netherland sent a letter of protest to Minuit, who was not deterred, however. Later that same year Minuit returned to Sweden for a second group of colonists. He sailed by way of the Caribbean to secure a cargo of tobacco to pay for the voyage but perished there at sea in a hurricane.

Mississippi River

The 2,300-mile Mississippi River bisects the center of the North American continent from Minnesota in the north to the Gulf of Mexico in the south. The river's vast drainage area covers the entire midsection of the continent from the Rocky Mountains to the Appalachian Mountains and contains a number of other large rivers, including the Missouri, the Red, the Arkansas, the Ohio, the Tennessee (which flows into the Ohio), and the Yazoo. The Mississippi became a center of French colonial rule in North America. It then became the natural boundary between competing colonial powers after the 1763 Treaty of Paris set it as the boundary between the colonial possessions of Great Britain and Spain.

Father Jacques Marquette and fur trader Louis Jolliet descend the Mississippi River in 1673. (Library of Congress)

The economic importance of the river cannot be overstated. Navigable waterways were, and in many ways still are, the economic lifeline of the region. They were necessary to move large quantities of goods cheaply from the areas of production to the market. Thus, control of the river gave the French control of the vast economic resources of the center of the North American continent, including both fur trading and agriculture.

Perhaps the most important point along this strategic river was New Orleans. Its location, a short distance above the river's mouth at the Gulf of Mexico, made it the central controlling point of economic activity on the river and thus of the center of the continent. The French commandant general of Louisiana, Jean-Baptiste Le Moyne de Bienville, established New Orleans in 1718.

Whereas Spanish exploration of the river began in the 16th century, the French staked their claim to the river in the 17th century. In 1519, Alonso Álvarez de Pineda sighted the mouth of the river. And in 1542, Hernando de Soto reached the river. It then became a part of Spain's claim to the Gulf Coast of North America. French explorers Jacques Marquette and Louis Jolliet traveled down the river looking for a link to the Pacific Ocean, which did not exist. René-Robert Cavelier, Sieur de La Salle, also traveled down the river to its mouth and laid claim to Louisiana for France in 1682. The French claims in the center of North America were based on control of the entire watershed drained by the Mississippi; thus the river was the center of French Louisiana.

The French claim would also be a source of tension among the three major colonial powers. The Spanish were concerned because the French claim meant a gap in the Spanish claim to the entire Gulf Coast. The French and the British eventually came to blows over the issue of control of the Ohio River Valley.

The French and Indian War (1754–1763) between these two major colonial powers ended in a complete British victory. It saw the river become a boundary between the two great remaining colonial empires in North America of Britain and Spain. All the territory east of the Mississippi, excluding New Orleans, became British, and all the territory west of the Mississippi became Spanish. This made the Mississippi an international boundary. Both powers gained the right of navigation on the river. At the conclusion of the American Revolutionary War, the river served as the international boundary between Spanish Louisiana and the newly independent United States. Navigation rights on the river would be a bone of contention between the two counties, however, until the Louisiana Purchase in 1803.

Mog

Born: Unknown Died: May 13, 1677

Abenaki headman responsible for a series of Abenaki victories over New England colonists during King Philip's War (1675–1676). Nothing is known about Mog's birth, youth, or early career. Not even his tribal affiliation can be stated with certainty. Whether he belonged to the Kennebec or Androscoggin Abenaki communities is unclear. Mog's English contemporaries took him to be a Penobscot Abenaki, which was an error.

By July 1676, Mog had become a sachem, or chief, of his people and made his first appearance in the historical record when he attended a meeting of Abenaki sachems with representatives of Massachusetts. Some Abenaki groups had been caught up in King Philip's War, and as a result the colony had embargoed trade with all Abenakis. The assembled sachems offered peace in return for renewed commerce. However, the Massachusetts representatives rebuffed the offer. Angered by such intransigence, the Abenakis as a whole decided to enter the war.

Presumably, Mog led some of the raids that devastated the English settlements in Maine (then part of Massachusetts) in the fall of 1676. He certainly presided over the greatest Abenaki victory of the season when he and his warriors captured the English fort at Black Point on October 12, 1676. Emboldened, he sent word to Boston that he was willing to negotiate for peace. That winter, the Massachusetts Council had him brought to Boston, by ship, for talks. At those talks the council attempted to cajole Mog into signing a treaty conceding Abenaki defeat in the war. It was a concession completely divorced from reality. Nevertheless, Mog signed the treaty, presumably out of fear for his life. He then escaped back to Maine, where he repudiated the agreement.

Mog boasted that, thanks to his visit, he had found the way to burn Boston. He planned to capture English fishing boats and then use them to mount an amphibious assault on the town. To this end, Abenaki warriors began seizing English vessels. However, they found them too cumbersome to use. Given sufficient time, Mog might have found a solution to this difficulty, but his time was about to run out.

The English had retaken Black Point over the winter, and on May 13, 1677, Mog led an expedition to recapture it. During the assault, he was shot and killed. To honor his father's achievements, Mog's son changed his own name to Mog. He would figure prominently in later Abenaki–New England wars.

Mohawk-Mahican War

Start Date: 1624 End Date: 1628

The Mohawks waged war against the Mahicans during 1624–1628 to help secure Mohawk access to Dutch traders at Fort Orange (present-day Albany, New York). In many respects, the Mohawk-Mahican War can be considered the prototype for the Beaver Wars (Iroquois Wars, 1641–1701). In those conflicts, the Iroquois Confederation waged war against other native peoples in the Great lakes and Ohio Country over access to furs and European trading posts. The Mohawk-Mahican War was the first conflict of the colonial period in which one of the Iroquois Five Nations went to war with the objective of securing trade with a European power.

In 1614, the Dutch established Fort Orange (at first called Fort Nassau) approximately 160 miles north of New Amsterdam, at the confluence of the Mohawk River and the Hudson River. The post gave them access to furs from the north via the Lake Champlain corridor and from the west via the Mohawk River. The fort straddled the territories of two peoples who had maintained an uneasy peace, the Algonquian-speaking Mahicans, whom the Dutch and later the English sometimes called the "River Indians," and the Mohawks, the easternmost nation of the Iroquois Confederation. Both had long fought the other, seeking captives to replace their dead.

With the establishment of Fort Orange, the Dutch unwittingly introduced a new element to the conflict. Native peoples quickly realized the advantages of European trade goods. Metal implements were sharper and more durable than stone tools, and woolen cloth was warmer and dried more quickly than leather. Soon the natives became increasingly dependent on European goods. They also realized that it was to their advantage not only to possess metal tools and weapons, but also to deny them to their enemies. This seems to have been the chief motivation behind Mohawk attacks on the Mahicans. If the Mohawks could displace the Mahicans and drive them away from the vicinity of Fort Orange, the Dutch would be forced to trade exclusively with them.

Outnumbered by the natives in the vicinity, dependent on them as trading partners, and not wanting any part of the fighting, at the start of the conflict most of the Dutch departed Fort Orange for New Amsterdam. For the most part, the Dutch who remained at Fort Orange wanted the Mahicans to win the war, which had begun in 1624. But they stood by as the conflict raged, more concerned about the effects the war had on trade than anything else.

In 1626, the Dutch entered the fray. Seven Dutchmen from Fort Orange actively sided with the Mahicans, joining them in a war party against the Mohawks. Despite the presence of Dutch soldiers with firearms, the Mohawks, who were armed only with bows and arrows, successfully ambushed them and their Mahican allies. The Mohawks killed four of the Dutchmen. To set an example, the Mohawks allegedly immediately roasted one of the dead men and devoured him in plain sight of the survivors.

Realizing the disastrous effect that this incident could have on trade, the Dutch West India Company moved swiftly to repair relations with the Mohawks. A few days after the incident, Dutch trader Pieter Barentsz visited the Mohawks and apologized for the raid. Peter Minuit, the new director of New Amsterdam, also visited the Mohawks. Within a few days, he had appointed a new representative to Fort Orange who was well acquainted with the Mohawk language.

For their part, the Mohawks expressed surprise that the Dutch had meddled in the conflict. They too offered apologies, stating that had the Dutchmen not interfered, there would have been no bloodshed. Following this incident, the Dutch West India Company adopted a policy of strict noninterference with the Five Nations.

The conflict ended sometime in late 1628, with the Mohawks haven driven most of the Mahicans east and south. Many of the Mahicans relocated to the Connecticut River Valley. Still others were captured and adopted into Iroquois clans.

The Mohawk-Mahican War is important in that it was the first conflict fought between native peoples for primarily commercial motives. Both sides were trying to secure their trade with the Dutch at Fort Orange at the expense of the other. The war also may have served as a template for the later Iroquois Wars against the Hurons and other natives in their quest to gain control of the beaver pelt trade.

Mohawks

Native American group, part of the Five (later Six) Nations of the Iroquois, or Iroquois Confederation, whose territory included much of upstate New York. The Mohawks, along with the Senecas, comprised one of the two main fighting wings of the Iroquois Confederation during the colonial period. They participated in wars against the French and their Algonquin allies and served as the principal enforcers of British-Iroquois policy following the creation of the Covenant Chain alliance in the late 1600s.

The Mohawks, or *Ganienkeh* (people of the place of the flint), occupied the Mohawk River region west of Albany in present-day New

Contemporary illustration of a Mohawk Native American village. The Mohawks constituted one of the original five tribes of the Iroquois Confederacy. (North Wind Picture Archives)

York. They guarded the "eastern door" of the Iroquois Confederation, where they became the first Iroquois to encounter European trade goods, which they acquired during raids against their Algonquian neighbors to the north. Soon they discovered Europeans as well.

In July 1609, allied Algonquins from the St. Lawrence River Valley defeated some 200 Mohawks near the southern tip of Lake Champlain. The Algonquins brought along a handful of French soldiers, including Samuel de Champlain, whose firearms helped carry the day. The following year, the Algonquins and French defeated the Mohawks in an even larger battle. Saddled with technological inferiority, the Mohawks, demonstrating the independence of action that characterized membership in the confederation, sought and obtained a trade alliance with the Dutch at Fort Orange (Albany). This agreement brought the firearms they desired.

Armed and aggressive, the Mohawks interjected themselves into the fur trade during the mid-17th century. Handicapped by their limited access to valuable furs and European trade centers, the Mohawks initiated a series of systematic wars, known as the Beaver Wars, to secure direct access to both fur supplies and European traders. Their main targets were the Mahicans, who managed trade with the Dutch at Fort Orange. They also targeted the Hurons, who

controlled western fur resources and blocked Mohawk access to fur supplies in the St. Lawrence Valley and the Great Lakes region. In the 1620s, the Mohawks drove the Mahicans to the east of Fort Orange. They then took control of the fur trade with the Dutch. Conflict between the Mohawks and the Mahicans continued intermittently for the next 50 years, until English authorities brokered a peace deal in 1673. That arrangement formally brought the Mahicans under Iroquois control.

The Hurons fared no better. In the 1640s, the Mohawks and the Senecas invaded Huron territory and, over the next decade, burned Huron towns and villages. They also destroyed their agricultural fields, systematically exterminated entire groups of Hurons, and forcibly assimilated most of the survivors into Iroquois society. By 1653, the Hurons had been eliminated as an independent political entity.

When the English supplanted the Dutch as the colonial masters of New York, the Mohawks effortlessly shifted their trade interests to the newcomers. They became so invested in their new friendship with the English that Mohawk leaders refused to ratify a peace agreement between the Iroquois Confederation and the French. As a result, in 1666 the French twice sent punitive expeditions into Mohawk territory, finally forcing the Mohawks into submission.

Yet the evolving Iroquois-English alliance, known as the Covenant Chain, afforded the Mohawks a means to cast off French influence. As the Iroquois Nation closest to Albany, the Mohawks cultivated an especially close relationship with English traders and officials. The Iroquoian wars of the late 17th century gradually merged with the European wars between the French and the British. And the Mohawks, more than any other Iroquoian people, supported the English against the French. The results, however, did not always favor the Mohawks. During King William's War (1689-1697), the Mohawks suffered heavily at the hands of the French and their native allies. In 1693, in particular, the French destroyed three large Mohawk villages and French-allied warriors took over 300 Mohawks into captivity. The rest of the Five Nations Iroquois suffered similar defeats, until at last the Iroquois Confederation concluded a peace treaty with the French in 1701. In it, they pledged to remain neutral in future disputes between France and England.

Maintaining that neutrality proved difficult for the Mohawks because of their close proximity to the British, whose commerce and culture steadily seeped into Mohawk society. Protestant missionaries were particularly active, winning converts among Mohawk leaders and commoners alike. Not surprisingly, during both Queen Anne's War (1702–1713) and King George's War (1744–1748), Mohawk warriors fought to aid the British cause. Then, during the French and Indian War (1754–1763), Mohawk military aid to the British intensified even further. This was in no small part due to the influence of Sir William Johnson, the British superintendent of Indian Affairs for the northern colonies who maintained a residence among the Mohawks and twice married Mohawk women. Mohawk war parties helped Johnson achieve victory at the Battle of Lake George (1755) and played an important role in the successful campaign against Fort Niagara in 1759.

The Mohawks' close relationships with the British perhaps afforded them greater status than other members of the Iroquois Confederation during the 18th century, but ultimately it proved their undoing. During the American Revolutionary War, the Mohawks refused to abandon their attachment to the British, a stance that helped to transform the struggle for American independence into an Iroquoian civil war that brought about the end of the confederation.

Mohegans

Algonquian-speaking Native American tribe that lived along the Thames River in Connecticut. Mohegan territory also extended into Massachusetts and Rhode Island. The life ways of the Mohegans were similar to other northeastern woodland natives. They roamed the forests, lakes, rivers, bays, and the tidal waters of the Atlantic Ocean to hunt and fish. They also planted corn and other vegetables in summer locations. The Mohegans fashioned canoes that were either birch bark covered framed canoes or dugout canoes. The tribe lived in wigwams, which were usually covered with birch bark or hides. The Mohegans also built more permanent rectangular-shaped housing.

The origins of the Mohegan tribe are somewhat obscure. Older scholars thought that they were a branch of the Mahicans (Mohicans), another Algonquian-speaking tribe living in the Hudson River Valley in New York. It was also thought that the Pequots of Massachusetts were a subgroup of the Mohegans. Today, scholars believe that the Mohegans were a subgroup of the Pequot, who separated from them about the time the first English settlers landed at Plymouth Rock in 1620. In 1620, the sachem Sassacus was the chief of the Pequots. Uncas, a subordinate chief, rejected Sassacus's authority and led a splinter group to the Thames River not far from Long Island Sound. The cause of the separation apparently lay in political disagreements among several of their chiefs.

Because the names "Mohegan" and "Mahican" sound very similar, the Mohegans are often confused with the Mahicans. The Mahicans were called Loups ("wolves") by the French, possibly because the word "Mahican" may have derived from *maingan*, meaning "wolf." However, "Mohegan" seems to have come from an Algonquin word meaning "tides." James Fenimore Cooper made the Mahicans famous in his 1826 novel *The Last of the Mohicans*. Adding to the confusion was the fact that Cooper used as a character a "Mohican" who "lived by the sea." Moreover, the names of several other characters seem to have been drawn from the Mohegans. Although they may have been distantly related, the Pequot-Mohegans were a distinctively different group from the Mahicans.

Uncas befriended the English colonists. After the English defeated the Pequots in the Pequot War (1636–1638), the Mohegans became a powerful tribe. After the conflict, they laid claim to Pequot lands as well as their own. In addition, they absorbed many of the remaining Pequots.

The Mohegans aided the colonists in King Philip's War (1675–1676). Metacom (King Philip), the chief of the Wampanoags, had allied with the Nipmucks and the Narragansetts. During the autumn of 1675, Metacom's forces had been quite successful in attacks on English settlements and their forces. However, on December 19,

1675, a combined force of colonial troops from Massachusetts Bay, Plymouth, and Connecticut joined forces with 150 Mohegan warriors. They proceeded to attack the main Narragansett village in Rhode Island, which was located in a well-defended swampy area. The swamps were already frozen in bitter winter weather, allowing the militia and Mohegan forces, commanded by Plymouth governor Josiah Winslow, to attack the village. In prolonged fighting, the Narragansett village was destroyed. Probably a thousand or more of Metacom's allies were killed, including a great many women and children who were burned to death in their fort. Militia losses were less than two dozen dead.

The Mohegans were constant allies of the English in the wars against the French. However, eventually their numbers were severely reduced by European diseases, especially repeated epidemics of smallpox. Later, British settlers took much of the Mohegans' lands and sold some of them into slavery in the West Indies. By 1775, a surviving group of the Mohegans had joined with a mixed group of Christianized natives who were living at Brotherton, New York. The group was led by Rev. Samson Occom, a Mohegan minister. The group was relocated voluntarily by the federal government to the Stockbridge Reservation in Wisconsin in the 1820s. The Mohegan tribe survived, was formally recognized by the federal government in 1994, and has settled land claims with the state of Connecticut.

Molasses Act

Event Date: May 17, 1733

Tax imposed by Great Britain in 1733 on molasses and sugar imported by the American colonies. The Molasses Act was meant to deal with sugar products from French colonial islands in the Caribbean.

At first, the American colonies imported sugar from other British colonies in the Caribbean, but France imposed an importation ban on sugar from its colonial possessions because of concerns that this could create a rum trade and industry that would compete with brandy produced within France itself. At the same time, French taxes on its planters were lower than those of the British on their growers. As a result, French planters offered their sugar and molasses at prices below those of British planters in order to move the commodity.

Anno fexto

Georgii II. Regis.

An Act for the better fecuring and encouraging the Trade of His Majesty's Sugar Colonies in America.

penerge the Melfare and meaning profession of Pour Pajetly's Sugar Colonies in America are of the greatest Confequence and Importance to the Crave, Navigation, and Strength of this Kingdom: And whereas the Planters of the fall Sugar Colonies have of late Pears fallen under such great Discouragements, that they are unable to

improve or carer on the Sugar Crobe upon an equal Footing with the foreign Sugar Colonies, without fome Advantage and Reiler be given to them from Great Britis: For Remody whereof, and for the Sood and Cleifare of Pour Majeffy's Subjects, me Pour Majeffy's Muhicas, the Communis of Great British and loyal Subjects, the Communis of Great British affects in Parliament, have given and granted unto Pour Majeffy the feveral and respective Rates and Dutles beeted after mentioned, and in such Manaer and Form, as is herein after expressed; and design whose bumbly befreely Pour Majeffy that it may be considered that it may be considered that the same of th

The Molasses Act of May 1733. (Brown Brothers)

American traders were eager to acquire the cheap sugar and molasses in exchange for lumber, beef, and pork. Newfoundland imported the sugar and molasses in exchange for poor-quality fish destined as food for the slaves of the Caribbean. The molasses exported to the American colonies served as an important ingredient in domestically produced rum, the majority of which was consumed at home. Approximately 20 to 25 percent of this rum became part of the triangular trade system and was exchanged for gold, slaves, and ivory from Africa.

As early as 1710, British planters complained about these activities to both the Board of Trade and Parliament. The Board of Trade dodged the issue, but Parliament finally acted on behalf of the planters by passing the Molasses Act on May 17, 1733. The act did not ban the American importation of French sugar or molasses. But it did place a 6 pence per gallon tax on imported molasses. The molasses tax essentially doubled the price of the commodity, which had been selling for approximately 30 percent less than that offered by the British planters. It also added a tax to rum and sugar imported by the American colonies.

New Englanders viewed the tax as a threat to their trade, and they tended to avoid the tax through bribery and smuggling. During the 1730s and 1740s, the British government did little to enforce

the Molasses Act. Consequently, this so-called salutary neglect benefited the colonies. In fact, London actually spent more money on the customs bureaucracy than it received in molasses tax.

The Molasses Act angered the American colonists, who correctly viewed it as a threat to their profitable trade with Africa and the Caribbean. Smuggling, especially by merchants from Massachusetts, reduced the impact of the act on the colonial economy. Nonetheless, Parliament renewed the Molasses Act every five years at the insistence of the British West Indies planters. After the French and Indian War (1754–1763), Parliament replaced the Molasses Act by the more stringently enforced 1764 Sugar Act, which placed a tax on all sugar and molasses regardless of the source and thereby represented a clear attempt to raise revenue rather than regulate trade. This switch from salutary neglect helped to ignite the flame that erupted into the American Revolutionary War.

Monckton, Robert

Born: June 24, 1726 Died: May 21, 1782

British general and governor of New York from 1761 to 1764. Robert Monckton, the son of a peer and member of Parliament, was born on June 24, 1726, in Yorkshire, England. In 1741, he was commissioned in the 3rd Foot Guards. He fought in the War of the Austrian Succession (1740–1748) and advanced to the rank of lieutenant colonel of the 47th Foot in 1751. That same year Monckton entered Parliament, controlling the family seat of Pontefract. He was appointed to command Fort Lawrence in Nova Scotia in 1752 and became lieutenant governor of Annapolis Royal in 1754.

Monckton became a major figure in the French and Indian War (1754–1763). During the winter of 1754–1755, Monckton began plans for a 2,300-strong expedition against France's Fort Beauséjour and Fort Gaspereau on the Chignecto Isthmus. Taking advantage of surprise and excellent preparation, his larger force quickly overcame minimal French resistance and captured the forts in June 1755. Following the French surrender, Monckton implemented the instructions of Lt. Gov. Charles Lawrence by expelling and deporting the 1,100 Acadians in the area. Appointed lieutenant governor of Nova Scotia in December 1755, Monckton led an expedition against the

French along the St. John's River (in present-day New Brunswick) in 1758. That year, he was promoted to colonel.

In 1759, Monckton was named a brigade commander and second-in-command of the Quebec expedition. During the siege of Quebec, he led the landing at Point Lévis and directed the construction of batteries on the heights opposite the city. He also participated in the Battle of Montmorency Falls. At the end of August, responding to James Wolfe's request for advice, the expedition's three brigadiers—Monckton, George Townshend, and James Murray—suggested a landing above Quebec. Monckton directed the landing at Anse au Foulon and commanded the right of the British line in the Battle of the Plains of Abraham on September 13, 1759. During that battle he was severely wounded by a musket ball through his chest. Nevertheless, Monckton was able to recover sufficiently to assume command at Quebec for a month following the French surrender. During this time, the British consolidated their control over the city and surrounding area. On October 26, Monckton departed for New York to complete his recovery.

After commanding British forces in the southern provinces in 1760, Monckton was promoted to major general in February 1761. He became governor of New York the next month. In 1762, he led a force of 13,000 men to capture the French island of Martinique in a month-long campaign. Monckton returned to England the next year to face a court-martial in 1764 on charges of misconduct during the Martinique campaign but was fully exonerated. Promoted to lieutenant general in 1770, he again served in Parliament for both Pontefract and Portsmouth. Monckton died in London on May 21, 1782.

Monongahela, Battle of (1755)

See Braddock's Campaign

Monongahela River

River in modern-day West Virginia and western Pennsylvania. In the mid-18th century, the Monongahela was part of the water route connecting the Atlantic Coast and the Ohio River Valley. It was claimed by the Iroquois, the Cherokees, New France, and the Eng-

Plan of Fort Duquesne, located at the confluence of the Monongahela and Alleghany rivers, on the site of what is now Pittsburgh, Pennsylvania. (The Granger Collection)

lish colonies of Virginia and Pennsylvania. The river is formed on the Allegheny Plateau near present-day Fairmont, West Virginia, by the junction of the West Fork River and Tygart River. It meanders northward 128 miles until it joins with the Allegheny River to form the Ohio River, at the Forks of the Ohio, in modern-day Pittsburgh. In the 18th century, however, the area was covered in dense hardwood forests.

The Monongahela Valley seemed comparatively open and accessible to English settlers in the mid-18th century. The French had neglected the area, and there were no major Native American settlements near by. Thus it attracted the first English-speaking settlements west of the Appalachians. In the vicinity, however, lived displaced Delawares, Shawnees, and Mingos. They had no recognized claim to the territory. Rather, they had a vague tributary relationship to the Iroquois Confederation, which eroded as they increasingly dealt directly with Europeans. The French viewed English interests in the area as a threat to their fur trade and to communications between Canada and Louisiana.

By the 1730s, Pennsylvania traders were frequently moving through the area. The Ohio Company of Virginia, intending to settle the Monongahela Valley and the Ohio Valley and to join in the Indian trade, built a fortified storehouse on the Potomac (at Cumberland, Maryland) in 1749. Christopher Gist explored the Monongahela for the company in 1751–1752. Frontiersman Thomas Cresap and Nemacolin, a Delaware chief, blazed a path from the Potomac River to the Monongahela at Redstone Creek (Brownsville, Pennsylvania), 37 miles upstream from the Forks. In 1753, as the French began building

forts from Lake Erie to the Allegheny River, the Ohio Company built a trading post, the first multifamily settlement on the Monongahela.

The Virginia Militia began erecting a stockade at the Forks in February 1754, but the French seized the site in April and built Fort Duquesne. Lieutenant Colonel George Washington's Virginia forces failed to take Fort Duquesne in 1754. Likewise, British forces under Major General Edward Braddock were defeated in the Battle of the Monongahela, eight miles from the Forks, in 1755. English settlers abandoned the valley after Braddock's defeat. To make room for their wagons and artillery, however, Washington and Braddock improved on Nemacolin's road, which became part of Braddock's Road.

In 1758, Brigadier General John Forbes's British forces built their own road through Pennsylvania and succeeded in taking Fort Duquesne. As a result, the Delawares abandoned their French allies at the fort because they had been promised that the English would stay out of the Forks region. Nevertheless, the English built a temporary stockade on the banks of the Monongahela, 1,000 feet from the ruins of Duquesne, and rebuilt Fort Redstone, which had been burned by the French. They then built Fort Pitt at the Forks.

After the French and Indian War (1754–1763), settlers used the Forbes and Braddock roads to return to the Monongahela Valley, contributing to aggravated tensions with local American Indians. The army had unsuccessfully sought to force the settlers' departure in 1761–1762, but the need to supply the forts also provided the farmers with markets for their produce. Native raids during Pontiac's Rebellion (1763) once again forced the abandonment of the region.

In 1763, King George III prohibited English settlements west of the Appalachians without specific treaty provisions. Nevertheless, some settlers evidently returned. Under the Treaty of Fort Stanwix (1768), the Iroquois ceded the territory between the Appalachians and the Ohio River (the rival Cherokees confirmed this in the Treaty of Hard Labor). This move legally reopened the Monongahela Valley to white settlement.

Between 1768 and 1775, a series of conflicts among Native Americans, Virginians, and Pennsylvanians took place over control of the area. Both Pennsylvania and Virginia issued land grants to repopulate the region and to bolster their rival claims. Each arrested the other's settlers and officials. When the Shawnees revolted against the incursions, Virginia's Gov. John Murray, Lord Dunmore, launched a campaign against them. In the Treaty of Camp Charlotte (1774), ending what became known as Lord Dunmore's War, the Delawares, the Shawnees, and the Mingos relinquished their claims south of the Ohio (as the Iroquois and the Cherokees had already done). In the Treaty of Pittsburgh (1775), they and others promised to remain neutral in the conflict between the colonies and England in return for a pledge that the Ohio River be the permanent western boundary of white settlement. Neither side was able to keep its word, however.

Virginia finally yielded its claim to the Forks in 1776, owing to the exigencies of the American Revolutionary War. A border agreement in 1779 extended the Mason-Dixon Line west across the Monongahela Valley.

Montague-Dunk, George, Second Earl of Halifax

Born: October 5, 1716 Died: June 8, 1771

British colonial administrator. Born on the family estate in Northampshire, England, on October 5, 1716, George Montague was educated at Eton and Trinity College, Cambridge. He inherited his father's earldom in 1739. Halifax married an heiress in 1741 and added her family name, Dunk, to his own, making him George Montague-Dunk, Second Earl of Halifax.

In late 1748, Halifax became president of the Board of Trade, a subcommittee of the Privy Council charged with overseeing almost all aspects of colonial affairs. Unlike his predecessors, who had been content to let the colonies govern themselves with relatively little interference from London, Halifax immediately set out to reform colonial policy. His position charged him with promoting commerce within the empire, and toward that end, he energetically issued a series of decrees to coordinate British policy toward its colonies and mandate greater cooperation and consistency among the various provinces. Through diligent work and the administrative genius of his chief secretary John Pownall, Halifax quickly became expert in colonial affairs.

Despite the 1748 Treaty of Aix-la-Chapelle, Halifax remained deeply suspicious of French intentions in North America. Indeed, he was convinced that the French sought to restrict the British both in Canada and in the Ohio Valley. One of the steps he took to prevent such a development was the establishment of an armed fortress, appropriately named Halifax, in Nova Scotia to rival the French stronghold of Louisbourg. Halifax also ordered colonial officials to hold a conference to promote greater cooperation in regard to Native American affairs. The result was the Albany Congress of 1754.

During the French and Indian War (1754–1763), Halifax promoted Major General Edward Braddock's campaign into the Ohio Valley in 1755, not least because Braddock's appointment as commander in chief of British forces in North America brought a uniformity of command that Halifax had long sought in America. Indeed, Halifax almost singlehandedly convinced the other members of the ministry headed by Thomas Pelham-Holles, Duke of

Newcastle, of France's hostile intentions in North America, precipitating Britain's own aggressive stance.

As the French and Indian War wound down, a shakeup in the ministry led to Halifax leaving the Board of Trade in 1761 to become lord lieutenant of Ireland, which post he held until 1763. During 1762, he was also first lord of the Admiralty and then secretary of state for the Northern Department. In 1763, he became secretary of state for the Southern Department, a position that once again put him at the forefront of colonial affairs.

Within weeks of taking office, Halifax was confronted with the outbreak of Pontiac's Rebellion. As British forces began quelling this disturbance, he turned his attention to American Indian affairs, intent on preventing another such conflict. The result was the Proclamation of 1763. In addition, despite the financial burden placed on the British government, Halifax pushed for a stronger military presence in North America, arguing that regular soldiers were necessary to secure both internal and external peace in the colonies.

With his deep knowledge of American affairs, Halifax proved vital in efforts under George Grenville's ministry to crack down on smuggling and institute stricter trade regulations on the colonies, both of which contributed to the outbreak of the American Revolutionary War. Halifax left office when the Grenville ministry fell in July 1765, but he returned to the cabinet briefly as lord privy seal during the administration of his nephew, Frederick, Lord North, in 1770. He had just been restored to his former post as secretary of state for the Northern Department on his death at Horton, Hampshire, on June 8, 1771. He left no children, and his titles expired on his death.

Montcalm-Gozon de Saint Veran, Louis-Joseph de, Marquis de

Born: February 28, 1712 Died: September 13, 1759

Prominent French Army officer and commander of French forces in North America (1756–1759) during the French and Indian War (1754–1763). Louis-Joseph de Montcalm-Gozon de Saint Veran was born at the Château de Candiac, France, on February 28, 1712.

A very able military commander, French general Louis-Joseph, Marquis de Montcalm-Gozon de Saint Veran, led French field forces during the French and Indian War of 1754–1763. (Library of Congress)

His father was a career military officer and lieutenant colonel in the French Army. The young Montcalm joined his father's regiment as an ensign at age 12 and was commissioned at the age of 15 in 1727.

Montcalm first saw action in the War of the Polish Succession (1733–1738). On the death of his father in 1735, Montcalm inherited the family estate. He returned to the battlefield in the War of Austrian Succession (1740–1748). Wounded in fighting at Prague in 1740, he won promotion to colonel in 1742. Montcalm was wounded several times during the latter conflict. In 1746, he suffered five saber wounds in the Battle of Piacenza before he was taken prisoner. Exchanged shortly thereafter, Montcalm ended the war a brigadier general in command of a cavalry regiment.

Montcalm then returned to his estates at Candiac. He enjoyed time with his family, dabbled in politics, and supervised agricultural concerns on his estates. Meanwhile, tensions between France and Britain in North America boiled over into the French and Indian War in 1754. At the Battle of Lake George in September 1755, French major general Baron Jean-Armand Dieskau was wounded and captured by the English. French king Louis XV then appointed Montcalm a major general to replace Dieskau.

Montcalm arrived in New France in January 1756. Although Montcalm had charge of the troops, overall authority in New France was then vested in Governor-General Pierre de Rigaud de Vaudreuil. According to Montcalm's orders, he was clearly subordinate

to Vaudreuil. Nevertheless, the general and governor repeatedly clashed, leading to several verbal exchanges and angry letters to Versailles from both men. The quarrel between these two strong-willed men certainly had a debilitating effect on the French war effort in North America.

Montcalm reached Quebec on May 13, 1756, and reported to Vaudreuil a week later in Montreal. Shortly thereafter, the French military went on the offensive, scoring victories at Fort Bull, Oswego, and at Fort Ticonderoga. The victories did little to assuage tensions between Vaudreuil and Montcalm, however.

Several matters contributed to the hostility between the two men. Montcalm had little use for colonial troops and native allies. He wished to employ European tactics, had contempt for raids and guerilla warfare, and believed that he should have charge of all French forces and overall strategy in Canada. Vaudreuil held views diametrically opposed to those of Montcalm. The governor-general had little regard for the French regulars, believed in relying extensively on Native American allies, favored raids and guerrilla tactics, and believed strongly that he should control military strategy.

In 1757, Montcalm captured Fort William Henry on strategic Lake George in New York. After the British garrison surrendered, Montcalm was unable to control his native allies, who killed many of the garrison. Montcalm failed to follow up his capture of Fort William Henry by pushing on to capture other strategic points. In July 1758, however, with only 3,800 men, Montcalm successfully defended Fort Ticonderoga against 15,000 British led by Major General Sir James Abercromby. Montcalm was subsequently promoted to lieutenant general.

In 1759, the British went on the offensive. Brigadier General James Wolfe moved against Quebec. On September 13, 1759, Wolfe and his troops arrived on the Plains of Abraham next to the city. Montcalm foolishly ordered an immediate attack. In the ensuing battle, the British were victorious. Both commanders were mortally wounded, but Wolfe at least had the satisfaction of knowing before his death that his troops had won a great victory. Montcalm's legacy is a mixed one. Brave and a capable field commander, Montcalm's military skills were somewhat offset by the general's impatience and his unprofessional hostility toward his superior Vaudreuil, which probably hastened the loss of New France.

Montiano, Manuel de

Born: January 1685

Died: 1762

Spanish military officer and governor of La Florida (Florida) from 1737 to 1749. Born in January 1685 in Bilbao, Spain, to a prominent noble family, Manuel de Montiano served in the Spanish Army for 24 years before being appointed governor of Florida in 1737. By then, Montiano had attained the rank of colonel and captain of the grenadiers.

By the first third of the 18th century, the colonial possessions of Spain in North America extended to present-day Florida. The capital of the colony was St. Augustine, on the northeastern coast of the Florida Peninsula. The government structure of the colony was patterned after other Spanish colonial possessions, which featured a highly defined governmental apparatus as well as a hierarchical political structure. At the apex of that political structure was the governor. As governor, Montiano reported directly to the Spanish viceroy in Mexico City.

By the time of Montiano's appointment in 1737, Spain's geopolitical situation in the New World had become precarious. Most notable was the increasing population in the southern English North American colonies. In 1733, King George I awarded James Oglethorpe a vast territory of land in southeastern North America. Oglethorpe's colony, named Georgia after the English king, witnessed a considerable influx of colonists in its initial years. Spanish authorities were increasingly alarmed by the presence of the English in the Spanish borderlands.

In 1740, following the outbreak of the Anglo-Spanish War (1739–1744), the threat of English expansion into the Spanish empire became a reality. Oglethorpe launched a bold military move by attacking the Castillo de San Marcos at St. Augustine. Montiano successfully defended the fort for 38 days, and the English withdrew. Nevertheless, the Spanish Crown was shocked by this move. Madrid ordered Montiano to launch a counterattack against Oglethorpe in 1742. Montiano duly assembled a military force of some 1,900 men, consisting of free blacks, soldiers from the recently constructed Fort Mosé, and grenadiers from Havana.

On July 7, 1742, Montiano's forces met those of Oglethorpe in a decisive series of engagements, known as the Battle of Gully Hole and the Battle of Bloody Marsh, on St. Simons Island (Georgia). Bloody Marsh was a ringing defeat for Montiano, and he ordered a

retreat from Georgia. He also directed that the vital military garrison of Fort St. Simons be abandoned. During another British foray into Florida in 1743, Montiano refused to engage the enemy. Instead, he waited them out in the imposing Castillo de San Marcos. As in 1740, the English were forced to withdraw.

Montiano proved to be an able administrator. He improved and fortified key defensive positions in Florida and made valiant efforts to improve relations with the Native Americans. Unfortunately, his work yielded only modest results because of a lack of funding and support from Madrid and Mexico City. In November 1748, Montiano left Florida on being named governor of Panama. Ten years later, he left public service and returned to Spain. Montiano died in Madrid in 1762.

Montreal

French Canadian town located at the confluence of the St. Lawrence River and the Ottawa River. In 1535, Jacques Cartier sailed up the St. Lawrence to the Lachine Rapids and landed on an island that he named Mont-Réal. Cartier claimed the area for King Francis I, making it part of New France. In 1611, Samuel de Champlain established a fur-trading station at the site. Subsequent to that, the religious order of the Société Notre-Dame de Montréal (Society of Our Lady of Montreal) received a grant to the island on which a settlement had appeared by 1640. Its members administered a hospital, operated schools, and proselytized among the Native Americans. Operating from Montreal, *coureurs de bois* (fur traders and trappers) ranged north and west in pursuit of pelts.

In 1642, the utopian community of Ville-Marie de Montreal emerged, shielded from Iroquois threats by a pointed stake fence. The settlement became a protectorate, and in 1643 an agreement with the Mohawks brought more furs to the post. Yet repeated native raids disturbed the fur commerce until the French destroyed adjacent Iroquois villages in 1667. Montreal and its 766 inhabitants gradually evolved into New France's primary fur entrepôt. The settlement also became a rival of English-held Albany. In 1686, a military expedition from Montreal pounced on the Hudson's Bay Company and British-incited native assaults disrupted the settlement's hide business. Despite a 1688 truce effort with the natives, the Iroquois massacre of Lachine's population in 1689 sparked French retribution against Schenectady, New York, the following year.

During King William's War (1689–1697), Montreal-based forces staged *la petite guerre* (literally, "little war"), repeated small-scale

Hochelaga, site of Montreal, shown as a Native American village in a 1609 map by Marc Lescarbot. (North Wind Picture Archives)

raids against the English and their native allies. The city then came under attack. The English withdrew in 1690 once the French rushed 1,200 troops to La Prairie, on the St. Lawrence River's eastern bank. The next year, the English again reached La Prairie but were repulsed. In 1697, Montreal served as a base for a campaign against the Iroquois in the St. Lawrence region; however, they found only burnt and deserted villages. By 1701, a meeting at the settlement brought peace with the Five Nations of the Iroquois.

Queen Anne's War (1702–1713) placed Montreal away from the fighting. *La petite guerre* resumed, yet the Iroquois stayed neutral, and life in the settlement remained tranquil. The British seizure of a French supply ship caused shortages that led to a clothing mill's construction in 1703. Six years later, Claude de Ramezay, commander of the Canadians, faced a British march on Montreal. As soon as the defenders retreated east of the settlement, the invaders broke off the campaign and retreated.

Montreal entered King George's War (1744–1748) with improved defenses. The Chambly fortress guarded the Richelieu River approach and Fort St. Frédéric protected the Lake Champlain passage. A wartime atmosphere gripped the settlement as *la petite guerre* began once more and cross-boundary forays resumed. In 1747, the French neutralized an Iroquois threat upriver and the British disbanded a force at Albany preparing to campaign against Fort St. Frédéric.

The French and Indian War (1754–1763) saw Montreal's defenses become untenable once Quebec fell to the British in 1759.

Three converging armies advanced on the city the next year. British brigadier general James Murray led a force up the St. Lawrence River from Quebec and arrived at Varenne, downstream from Montreal, on August 31. Meanwhile, British forces under Colonel William Haviland drove up the Lake Champlain Valley and forced French troops out of Île-aux-Noix by August 25, who then retreated to Montreal. British major general Jeffery Amherst proceeded down the St. Lawrence River on August 10, compelled the surrender of Fort Lévis by August 25, and disembarked on Montreal Island's western side by September 6. Hampered by desertions and with few regulars, New France's Gov. Pierre de Rigaud de Vaudreuil de Cavagnial capitulated on September 8 when confronted with overwhelming odds.

Montreal's surrender to the British effectively marked the end of the French presence in Canada. The 1763 Treaty of Paris formally transferred control of French Canada to Great Britain. Under British rule, Montreal prospered owing to its strategic location on the St. Lawrence River. Fur trading gave way to larger, more diversified commercial enterprises, and the shipping and shipbuilding industries also contributed to the city's rising fortunes. By the early 19th century, Montreal had become British Canada's busiest city.

Moore, James

Born: ca. 1640 Died: 1706

Colonial soldier and South Carolina governor (1700–1703). James Moore was born in Ireland around 1640. He was descended from Roger Moore, leader of the Irish rebellion against England in 1640.

The younger Moore emigrated from Barbados to North America in 1665 and settled in Charles Town (present-day Charleston), Carolina (North Carolina became a separate colony with its own governor in 1710). Moore became wealthy trading with Carolina's native peoples, especially for Native American slaves. He ultimately acquired a large plantation near Charles Town. As part of an influential Anglican political faction, Moore served in the colonial assembly and was appointed to the council. On the death of Gov. James Blake of Carolina in 1700, Moore convinced the council to select him over a non-Anglican to fill the vacant office.

As governor, Moore proposed an expedition to oust the Spanish from St. Augustine, but his political enemies scorned the proposal as an attempt to enrich himself. The arrival of news that England was officially at war with France and Spain in what was known in the colonies as Queen Anne's War (1702–1713, the War of the Spanish Succession in Europe) curtailed political infighting long enough for the assembly to approve Moore's expedition.

In September 1702, Moore led more than 1,000 colonial militiamen and native allies against St. Augustine. His force occupied the town as the Spanish withdrew into the Castillo de San Marcos. Moore abandoned the eight-week siege of the fortress, however, when two Spanish vessels arrived from Havana. The Carolinians then burned the town and their own ships, and withdrew overland. Moore's enemies in the assembly moved to investigate his conduct of the failed expedition, but the majority supported him. The expedition incurred a debt of more than £8,000, however, for which the assembly eventually issued bills of credit. Moore, never formally confirmed as governor by Carolina's proprietors, stepped down in March 1703. He continued to serve on the council, and became attorney general.

Moore did not abandon his belief that the English should seize Spanish territory. At his own expense, Moore led a second expedition overland against northern Florida in 1704. His forces included some 50 colonists, and about 1,000 Creek, Yamasee, and Savannah warriors. He succeeded in destroying about three quarters of the Spanish-loyal native population. The expedition also enslaved perhaps 1,000 people, killed Spanish priests, and burned missions. The sale of slaves allowed Moore to claim that the expedition had paid for itself. Moore died in Charles Town during a yellow fever epidemic that raged through Carolina in late 1706. His son of the same name was later also governor.

Moore, James, Jr.

Born: ca. 1675 Died: March 3, 1723

Frontiersman, trader, colonial soldier, and provisional governor of South Carolina (1719–1721). James Moore Jr. was born around 1675 near Charles Town (present-day Charleston), South Carolina. One of the 10 children of Carolina governor James Moore, the younger Moore became, like his father, a hardened trader who did not shrink from armed conflict. Also like his father, Moore served in the colonial assembly, from 1706 to 1708.

In 1711, the Tuscaroras mounted a deadly surprise attack on settlements in North Carolina. Responding to the beleaguered colony's call for military assistance, in November 1712 the government at Charles Town dispatched James Moore Jr., a few dozen militia officers, and almost 1,000 native warriors (Cherokees, Creeks, and Catawbas) north to help fight the Tuscaroras. On March 20,1713, Moore's force burned the principal enemy village. The settlers inflicted nearly 1,000 casualties among Tuscarora men, women, and children, killing the men and selling the women and children into slavery. After the official end of the Tuscarora War in 1713, a few Tuscaroras persisted in raiding English settlements, but Moore and his men eventually rounded them up.

When the Yamasees attacked Charles Town in 1715, setting off the Yamasee War, the South Carolina governor, Charles Craven, appointed Moore lieutenant general in command of the colony's defense force. The group consisted of more than 1,000 men. The Yamasees, the Creeks, and the Catawbas came close to destroying the colony, and might have succeeded had Moore not persuaded the Cherokees to ally with the English.

In 1719, a rebellious political faction plotted to oust Carolina's proprietors and invite London to appoint a royal governor. They appointed Moore provisional South Carolina governor. He served as governor until the royal appointee, Francis Nicholson, arrived to take office in May 1721.

During Moore's brief tenure, he faced an overt challenge from the deposed governor, Robert Johnson, and his ally William Rhett, a powerful official under the proprietary government. The two assembled a militia and came to Charles Town to demand Moore's capitulation. When Moore refused to step down, Johnson opted to forego violence. Moore subsequently served the Nicholson administration as speaker of the assembly and commissioner for Indian Affairs. His death at Charles Town on March 3, 1723, put an abrupt end to his political career.

Moral y Sánchez, Francisco del

Born: Unknown Died: Unknown

Spanish military officer and governor of colonial Spanish Florida (1734–1737). Francisco del Moral y Sánchez began his career in the Spanish Army and served nearly 30 years in Cuba, the hub of the Spanish empire in the Caribbean and Atlantic basin. In 1733, the governor of Cuba named Moral governor of Florida. Moral's selection was notable in that the king did not appoint him directly. Hailed as the first colonial city in North America, St. Augustine served as the capital and principal outpost of Florida. Moral arrived there to take up his responsibilities in early 1734.

In 1730, Britain's King George II had sought to create a buffer zone between the Spanish in Florida and the English colonies of the Carolinas. As such, the English Crown assigned Major General James Oglethorpe the task of creating a colony just north of Florida on territory claimed—but not settled—by Spain. Oglethorpe landed near present-day Savannah, Georgia, in February 1733. The new colony was named Georgia in honor of the king.

Between 1733 and 1737, tensions rose between Georgia and Florida with the escalation of border incidents. To bolster his colony's defenses, Moral had ordered the construction of Fort Picolata and Fort San Francisco de Pupo. Because he was low on supplies and lacked adequate equipment and manpower for defense, Moral concluded treaties with both the English and the Native Americans. Oglethorpe and Moral agreed to restrain their native allies so that they would not precipitate violence, to demilitarize the St. Johns River, and to submit border disputes to arbitration. As a result, hostilities virtually ceased for a few years. But the Spanish government was not pleased with Moral's accommodative stance toward the English. In the meantime, Moral encouraged trade with the English and their native allies.

By 1737, Moral's controversial diplomacy and heavy-handed rule, which included the arrests of political rivals, brought his removal. In March 1737, the Spanish government appointed an acting governor who promptly ordered Moral's arrest. Moral remained in custody first in Havana and then Spain until 1740. The Council of the Indies finally cleared him of any wrongdoing in 1748. Although Moral's tenure in office was rife with controversy, he nonetheless did an admirable job keeping the English from encroaching on Spanish territory.

Morris, Robert Hunter

Born: ca. 1700

Died: January 27, 1764

Embattled governor of Pennsylvania during the French and Indian War (1754–1763). A member of a prominent political family, Robert Morris was born in Trenton, New Jersey, about 1700. His father, Lewis Morris, who also served as governor of New Jersey, appointed his son chief justice of the provincial supreme court in 1738.

In 1754, Robert Morris became governor of Pennsylvania as competing claims to the Ohio Country were plunging Britain and France headlong into war on the continent. Morris favored an aggressive approach to defending the colony, but he soon ran afoul of powerful Quakers whose pacifism frustrated the war effort. When British major general Edward Braddock sought funding from the Pennsylvania Assembly for his ill-fated expedition against Fort Duquesne in

Robert Morris, governor of Pennsylvania during the French and Indian War. (National Archives)

1755, Morris lost credibility when the British general was turned away empty-handed. Quakers also agitated over the bounties for prisoners and scalps offered by Morris's administration.

Late in 1755, Morris waffled over the request for an alliance by the Delaware chief known as Captain Jacobs. Pennsylvanians paid dearly for this equivocation as this warrior led raids along the Pennsylvania frontier on behalf of the French. Meanwhile, Morris faced intrigues on a different front. His close political and commercial ties to Gov. William Shirley of Massachusetts ultimately rendered him a target of Thomas Pownall, Shirley's political adversary. Having replaced Shirley in 1755, Pownall would secure Morris's removal from office the following year.

Despite Morris's desire for vigorous campaigning against the French and their native allies, the western counties of Pennsylvania largely deemed him negligent in safeguarding their communities. Even had Pownall not been intent on bringing him down, Morris surely would not have remained in office much longer. By 1756 he had managed to alienate many of the Quakers in the eastern part of the colony as well as settlers on the western frontier. In a final embarrassment, Morris was forced to endure a lengthy audit of his financial records, arranged by Pownall.

There can be little doubt that Morris fell victim to the vagaries of colonial politics, with its bitter factionalism and heavy use of patronage. Continuing to hold his position as New Jersey chief justice, Morris died in Shrewsbury, New Jersey, on January 27, 1764.

Mortar of the Okchai

Born: Unknown

Died: November 1774

The Mortar, also called Wolf Warrior in some accounts, was an influential member of the Upper Creek Nation and a key warrior of the Okchai settlement. Nothing is known of his birth or very young years. The Mortar became the leader of the Bear Clan of the Okchai faction of the Creek tribe, although he never rose to dominance within the entire Creek Nation.

The settlement of Okchai was located between the Coosa River and Tallapoosa River, both tributaries of the Alabama. The Mortar feared English incursions onto Creek territory and sought repeatedly to forge alliances with regional tribes to halt the spread of English settlements in Georgia, the Carolinas, and Virginia. However, he was never able to obtain sufficient support to unite even the Creeks, much less the rival Cherokees and Choctaws of the region. He nevertheless maintained close ties with the local Cherokee leadership, and the Mortar's sister was married to a Cherokee, providing a close familial connection.

The Mortar developed a reputation for farsightedness and diplomacy during the French and Indian War (1754-1763), when he counseled the leadership of the Creek Nation to remain neutral. In particular, an English plan to build fortifications on Creek territory infuriated him. The Mortar wished to side with the French to obtain protection against English expansion, but he realized that the French could never provide sufficient supplies to the Creeks to sustain a war against English colonists. Instead, the Mortar maneuvered the French and the English into lowering trading prices for the Creeks by threatening to push the tribe into the war, all the while carefully maintaining neutrality for the duration of the conflict.

In the aftermath of the war, the Mortar again sought to forge a regional alliance of 18 tribes to oppose British colonial expansion and possibly overthrow British rule in the Ohio River Valley. The British did successfully entice regional tribes to surrender their French flags, commissions, and medals for British equivalents. But they could never persuade the Mortar of their peaceful intentions. In 1766, when several Cherokees were murdered in Augusta County, Virginia, the Mortar offered to join a Cherokee war party with 700 warriors in pursuit of revenge, but his offer was refused. Under the Mortar's direction, Creeks killed 2 English traders found on Creek land and threatened to kill any other trespassers. This did not, however, provoke a general conflict with the English.

In 1774, during the Creek-Choctaw War, the Mortar sought Spanish and French assistance for the Creeks, asking the French to negotiate a peace with the rival Choctaw Nation and then establish a protectorate over the Creeks. While traveling to New Orleans to seek Spanish support in November 1774, the Mortar's party was ambushed by Choctaw warriors, and the Mortar was mortally wounded in the fighting. His death likely occurred in modern-day southern Mississippi or Alabama.

Mosley, Samuel

Born: June 14, 1641 Died: January 1680

Commander of an independent volunteer militia company in Massachusetts during King Philip's War (1675-1676). Samuel Mosley was born on June 14, 1641, in Braintree, Massachusetts. A cooper by trade, Mosley gained fame for his successes as a captain of a privateer operating off both Jamaica and the New England coast against Dutch pirates. After capturing two vessels in the spring of 1675, Mosley brought the pirates to Boston, where they were imprisoned to await trial. It was in the midst of his sudden fame, in June 1675, that King Philip's War began.

Despite his popularity, Mosley held no military position. Thus, he organized an independent company of volunteers to fight Metacom (King Philip) and the Wampanoags. Mosley's company was indeed an odd assortment of men. They included several of his crewmen from his privateering days, apprentices and servants, boys who had yet to enroll in the militia, and even a few of the jailed pirates that he had helped capture. In addition, his company kept a dozen dogs to help discover natives hidden in swampy and inaccessible regions.

Mosley and his company served widely during King Philip's War. They pursued Metacom and his band near Swansea and the Mount Hope Peninsula during the early days of fighting. In August 1675, they scouted near Mendon and Brookfield. Mosley's men were present at Deerfield, Massachusetts, in September 1675 when attacking natives nearly wiped out a company of soldiers and teamsters at the Battle of Bloody Brook. Mosley responded to the sounds of fighting but arrived too late to prevent the English defeat. His company then helped man Hatfield, a military center and garrison in the Connecticut River Valley, and participated in the assault on the Narragansetts' fort in December 1675. Mosley formed and led a second company in 1676.

During the war, Mosley gained a reputation for impulsive and questionable actions. In August 1675, based on intelligence gathered by torturing a captive, he arrested 15 Hassanemesit natives (Christian, or "praying Indians") on suspicion of raiding Marlborough, Massachusetts, and killing several inhabitants. Mosley shackled his prisoners and marched them to Boston, where they were acquitted, released, but then nearly lynched by a mob. Mosley was censured for his actions. He also allowed a female prisoner to be torn to pieces by one of the company's dogs. In another incident, Mosley and his band acted against specific orders and burned an abandoned Pennacook village near Concord, New Hampshire. This action forced the governor of Massachusetts to make restitution. Mosley's actions went far to convince friendly and neutral natives to avoid Englishmen.

Little is known of Mosley's life after King Philip's War, save for his purchase of 15 native captives in August 1676. He died in January 1680, but his place of death is not known.

Moulton, Jeremiah

Born: 1688

Died: July 20, 1765

Officer in the New England militia and member of the Massachusetts Council. Born in York, Massachusetts (now in Maine), in 1688, Jeremiah Moulton lost his parents in the Penobscot attack on York in January 1692. Four-year-old Moulton managed to escape from his Native American captors and flee into one of the garrison houses. He subsequently went to live with relatives and learned the surveying trade.

During Queen Anne's War (1702–1713), Moulton and his brother-in-law Johnson Harmon served in the militia and took an active part in the conflicts between English settlers and the eastern Native American tribes. Moulton gained a reputation as an energetic soldier and later proved to be a capable leader of colonial scouting expeditions during Dummer's War (1722–1727).

Captain Moulton played a prominent role in killing Father Sébastien Râle, a French missionary to the Norridgewocks. On August 23, 1724, some 200 colonial soldiers headed up the Kennebec River from Fort Richmond (Maine) and attacked Norridgewock village. Captain Harmon led the raid, with Moulton as second-in-command. Harmon chose to attack through the tribe's cornfields, and Moulton led his men directly into the village. The Native Americans were taken by surprise and tried to escape across the river, but they were killed in the water. Râle was killed, against Moulton's orders that he be captured alive. When the war was over, Moulton became a judge, sheriff of York County, and a member of the Massachusetts Council.

During King George's War (1744–1748), Moulton resumed his career as colonel, commanding one of the three Massachusetts regiments in the expedition against Louisbourg in 1745. In April 1745, he landed with the New England troops at Canso. With about 400 men, he then destroyed Port-Toulouse, a small French settlement on Cape Breton (St. Peters), on May 6. Moulton was a member of the war council at Louisbourg and stayed on after the fall of the town in June to help with its occupation. He returned to Maine in December 1745 and was appointed judge of probate for York County shortly thereafter. Moulton died in York on July 20, 1765.

Mourning War

A social and cultural phenomenon among Native Americans belonging to Iroquois tribes, the purpose of which was to acquire captives as a method of coping with death. The current use of the term "mourning war" stems from historian Daniel K. Richter, who notes that mourning war was the traditional function of warfare for Iroquois warriors prior to contact with Europeans.

The Iroquois believed that an individual's passing robbed his family, clan, and community of spiritual power. To address this problem, communities adopted new persons in "requickening" ceremonies to take the place and fulfill the social role and duties of the deceased. When the departed was an individual of high status, an adoptee was taken from within the community. But those of lower status often required adoptees from external sources. Mourning war also provided on outlet for grief. The Iroquois had several rituals and practices to address bereavement. However, if these failed, the women of the deceased's household could demand that a party of warriors venture out to acquire captives. Most of these people were assimilated into household and family roles previously filled by deceased kin. Some, however—usually adult men—might be selected for ritual torture and execution in order to assuage the sorrow and pain of grieving family members.

Mourning war fulfilled a number of important social functions, in that the adoption of captives maintained population levels, the continuity of village and family life, and the spiritual power of the community. It also provided a means to cope with the emotional trauma of death. Moreover, these functions had two important consequences on Iroquois warfare tactics. First, they stressed the capture of prisoners, not the killing of enemies. Second, they helped minimize Iroquois deaths in battle. As a result, mourning war tactics stressed the use of surprise and ambush (the skulking way of war), foregoing attacks on fortified places, and retreating when an enemy appeared too powerful.

Murray, James

Born: January 21, 1722 Died: June 18, 1794

British general. James Murray was born on January 21, 1722, at Ballencrieff, Haddingtonshire, Scotland. He was the son of the Fourth

Lord Elibank. After serving for three years with the 3rd Royal Scots Regiment in West Flanders, Murray was commissioned in the 4th Marines in 1740. The following year he transferred to the 15th Foot as a captain and served in the 1741 Cartagena expedition. He also served in the defense of Ostend in 1745, where he was severely wounded, and in the Lorient expedition of 1746. In September 1757, Murray commanded the 15th Foot in the ill-fated Rochefort expedition.

In 1758, Murray took command of a brigade in North America, participating in the siege of Louisbourg that same year. His conduct there earned the praise of Brigadier General James Wolfe. As a result, Murray was named one of the three brigadiers, along with Robert Monckton and George Townshend, to serve under Wolfe at Quebec the following year. During operations against Quebec, Murray fought in the defeat at the Battle of Montmorency Falls and commanded raiding operations above Quebec in early August.

The relationship between Wolfe and his three brigadiers grew extremely strained during the siege against Quebec, with Murray and Townshend especially loathing their commander. Nonetheless, at the end of August 1759, Wolfe requested the opinions of his brigadiers regarding further attacks on the Beauport lines. Rejecting the proposal of again attacking Major General Louis-Joseph, Marquis de Montcalm's, strongest position, the brigadiers advised concentrating the British force for a landing above Quebec. In the ensuing Battle of the Plains of Abraham on September 13, 1759, Murray commanded the left of the British line. He has been criticized for his role in the battle in leading the 78th Foot in mopping up pockets of resistance rather than pursuing and possibly cutting off the main body of the retreating French forces.

Despite being the expedition's most junior brigadier, Murray commanded the British garrison at Quebec. He strengthened its fortifications. In the spring of 1760, the French, under Brigadier General François Gaston, Duc de Lévis, advanced on Quebec. On April 28, Murray rashly chose to attack the numerically superior French force at the Battle of Sainte Foy. In bitter fighting, the British left flank collapsed, forcing Murray to withdraw back inside the fortress of Quebec. However, Murray quickly reestablished order among his command and withstood the French siege for 17 days until Royal Navy ships arrived to lift it. Following the resupply of his forces and arrival of reinforcements, Murray advanced up the St. Lawrence River as part of Major General Jeffery Amherst's multipronged assault on Montreal.

Murray remained in Canada for six years following the French capitulation as military governor of Quebec. After the Treaty of Paris, Murray became the first civil governor of Canada (then still called Quebec) in November 1763. Murray's policies of protecting French Canadians aroused the ire of British immigrants, who secured his recall in 1766. An inquiry in the House of Lords exonerated him. Murray officially remained as governor until 1768 but did not return to Canada. Nonetheless, his farsighted policies led to the Quebec Act of 1774, which secured the rights of the colony's French inhabitants.

Promoted to lieutenant general in May 1772, Murray was appointed lieutenant governor of Minorca in 1774. He became

governor of the island in 1779. Following a six-month siege by a combined Spanish-French force and a gallant British defense, Murray was forced to surrender the island on February 5, 1782. Tried by court-martial, he was exonerated. Promoted to full general on February 19, 1783, Murray died at Beauport House in Sussex, England, on June 18, 1794.

Murray, John, Fourth Earl of Dunmore

Born: 1730 or 1732 Died: February 25, 1809

British colonial administrator, governor of New York (1770–1771), governor of Virginia (1771–1775), and governor of the Bahamas (1787–1796). Born in Scotland, in 1730 or 1732, John Murray was a descendant of the Scottish house of Stuart. The eldest son of William Murray, Third Earl of Dunmore, Murray succeeded to the title in 1756. He was a member of the House of Lords from 1761 to 1770, when he was appointed governor of New York.

The next year, in 1771, Dunmore was appointed governor of Virginia, England's largest and wealthiest North American colony. Very much interested in promoting colonial settlement of the western lands, during 1771–1774 Dunmore directed a series of military campaigns against the Native Americans—chiefly the Shawnees—in what became known as Lord Dunmore's War. The fighting ended with the Shawnees ceding to Britain all lands east and south of the Ohio River.

Despite Dunmore's success in fighting those outside of Virginia, he fared much worse with those inside the colony. Although his war

with the natives had made him a hero in Virginia, in 1774 his dissolution of Virginia's colonial assembly, the House of Burgesses, for its opposition to British policy led to the creation of a revolutionary convention in Virginia that supplied delegates to the subsequent American Continental Congresses. In 1775, Dunmore's removal of the colony's gunpowder stores from the Williamsburg Magazine led to threats against his life. Dunmore fled Williamsburg, then Virginia's capital, to take refuge aboard a British warship off Norfolk.

While aboard ship on November 7, 1775, Dunmore issued his most memorable declaration, in which he proclaimed martial law and declared as free all indentured servants and slaves who were able and willing to bear arms in support of the British cause. This was the first mass emancipation of slaves in British North America. Dunmore's declaration of martial law and offer of emancipation threatened the property rights of all Virginians, moderate and radical alike. It also polarized the colony into two camps: Patriots and Loyalists. Dunmore subsequently organized a number of black Loyalists into the Ethiopian Regiment. His force was subsequently defeated in the Battle of Great Bridge near Norfolk on December 9, 1775.

By July 1776, having failed to regain control of Virginia, Lord Dunmore returned to England. He returned to America in 1781 and again proposed arming the slaves to subdue the American revolutionaries, but the proposal was ignored and he sailed back to England. In 1787, he crossed the Atlantic once more to serve as governor of the Bahamas, a position he held until 1796. Retiring to England, Dunmore died there on February 25, 1809.

Musgrove, Mary

Born: ca. 1700 Died: 1763

Trader, diplomat, interpreter, and cultural liaison of mixed Creek-English decent. Mary Musgrove, also known as Coosaponakeesa, was born around 1700 in Coweta, an influential Lower Creek village in modern-day Georgia. She was the daughter of a white, English trader and a Creek mother.

Musgrove was brought up with an understanding and respect for both sides of her cultural lineage. She spent her formative years among the Creeks, but was also baptized and educated for five years in South Carolina. As such, she became one of the few natives of the period who could read and write. Musgrove returned to Coweta around 1715 and was there when Colonel John Musgrove headed an expedition to the Creeks during the Yamasee War. The two sides confirmed the peace with a pledge of marriage between Mary and John's son and namesake, John Musgrove Jr.

The newlyweds set up a trading post near present-day Savannah and were very successful. Mary often facilitated not only economic but diplomatic and social affairs as well. When James Oglethorpe founded Georgia in 1733, he requested Musgrove's help. She encouraged the local natives to provide food and military aid to the fledgling colony, and she herself served as Oglethorpe's official interpreter for almost a decade. During this period, Musgrove did much to foster amicable relations between the British and the Creek Confederacy. Indeed, Oglethorpe himself recognized the colony's indebtedness to her.

The alliance between the British and the Creeks, including the Creek military aid against the Spanish in the Anglo-Spanish War (1739–1744, also known as the War of Jenkins' Ear), was largely secured by her and a distant relative, Tomochichi. Musgrove also helped to negotiate the treaties that established Georgia's two main colonial towns: Savannah and Augusta.

After John Musgrove died in 1735, Mary successfully managed the considerable family assets. She married Jacob Matthews a year or so later, and the two set up another trading post called Mount Venture on the Altamaha River. After Matthews died in 1742, Mary married again in 1744. Her choice of a third husband, Thomas Bosomworth, raised eyebrows. Many considered him an unscrupulous character, and Mary's influence among the English began to decline after their marriage, especially after the couple initiated a series of controversial land claims.

The problem dated back to 1737, when Tomochichi had granted Mary a plot of land near Savannah. In 1747, other Creek chiefs (and possible relatives of Mary) granted her more land, including three of the Georgia Sea Islands. British officials contested the legality of those grants. The debate came to a head in Savannah in 1749, when Mary and many of her Creek relatives arrived in the capital city to press her legal right to the land. The town was a bit intimidated by such a presence, and Mary fell from favor. She was finally able to plead her case before the courts in England in 1754, but a compromise was not reached until 1760. Mary managed to maintain ownership over one of the three islands and acquired a sum of money as reward for her services to the king.

In the wake of the land controversy, Musgrove's involvement in Georgia-Creek relations waned, but the importance of her influence during the early years of the colony cannot be overestimated. She died sometime in 1763 at her home on St. Catherines Island, off the Georgia coast.

Muskets

The introduction from China of gunpowder into Europe in the 13th century led to a military revolution. Gunpowder consisted of saltpeter (providing oxygen for burning), sulfur (which lowered the temperature at which ignition of the powder occurs), and charcoal (which added bulk to the entire mixture and acted as a burning agent). Gunpowder changed little over the years, and "black powder" remained the principal propellant for firearms until the end of the 19th century.

When ignited, gunpowder generates great heat, releasing energy in the form of powerfully expanding gases. Properly channeled, these gases could be used to propel a projectile from a barrel at some velocity and distance. Large projectiles could batter down castle walls, and the smallest could penetrate body armor.

Larger cannon led the way, but in the late 14th and early 15th centuries a wide variety of individual hand "gonnes" appeared. The first primitive types consisted of a tapered wooden pole that was partially hollowed out at its larger end to hold a small, short metal barrel. Metal bands secured the barrel to its "gun stock." Behind the barrel a vertical metal spike running through the stock could be hooked over a portable rest in order to absorb recoil.

The earliest firearms were both unwieldy and heavy. Until about 1660, heavy so-called Spanish-style muskets were fired from a simple forked rest. Even the later lighter firearm models were cumbersome and difficult to load.

Although early gunpowder weapons were wildly inaccurate, infantrymen armed with them could employ them to kill or maim knights on horseback. Such weapons in the hands of well-trained individual infantrymen would eventually end the primacy of horse cavalry and knights on the battlefields of Europe.

To fire the "gonne," the individual using it would pour a set amount of gunpowder down the muzzle, then ram a round ball (usually of lead) after it in order to seat the ball against the powder charge at the bottom of the breach. The ball was wrapped in a cloth wad to ensure a tight fit between ball and barrel to hold the ball in place next to the powder. The individual would ignite the powder charge by means of a slow-burning match applied to the small hole (touch hole) in the top of the breach end of the barrel over the charge.

Until the mid-19th century and the introduction of a new cylindro-conoidal bullet in a rifled barrel, all individual firearms were

Firing Mechanisms of Colonial Muskets

Name	Firing Mechanism	
Matchlock	Tip of slow match plunged into priming powder	
Wheel-lock	Piece of iron pyrite struck against rotating wheel, creating sparks to ignite powder	
Snap-lock	Piece of flint struck against steel, creating sparks to ignite powder	
Flintlock	Refinement of snap-lock, with steel and powder pan cover one piece	

basically the same: smoothbore muzzle-loaders that differed only in the means of their ignition. Improvements in the firing process, however, came steadily after the gun's first appearance. "The hand gonne," culverin, or culiver (there are a bewildering number of names for early firearms) gave way to the harquebus or arquebus (a late-16th-century term for any type of long, individual firearm), and firelocks. Shoulder stocks appeared around 1470. By the early 1500s, hand-held firearms were on the battlefield to stay, accompanied by the invention of a new wheel-lock mechanism. Pistols made their appearance about 1540 and later that same decade the snaplock appeared. By the first decade of the 17th century and the beginning of European settlement of North America, a true flintlock had emerged. Flintlocks were in widespread use by 1650, and by the end of the century they largely had replaced the matchlock, at least in Europe.

As with most individual firearms through at least mid-19th century, the matchlock successor to the "hand gonne" had a long wooden stock. One end of the stock fitted against the individual's shoulder, and the stock itself held the cast-iron barrel and firing mechanism. Unlike the primitive "hand gonne," the matchlock had a trigger mechanism. On the trigger being pulled, its mechanism plunged the glowing tip of a slow match into priming powder in a pan, which then ignited the main charge in the barrel. A great many varieties of matchlock existed but in most cases the priming pan had to be opened by hand before the trigger was pulled.

Matchlocks did not immediately supplant bows or crossbows. The match proved susceptible to rain and wind, and it could reveal troop positions at night, inhibiting ambushes and surprise attacks. Matchlocks nonetheless initially had great psychological impact, especially in colonial America against natives. The Native Americans, however, soon overcame their fear of the great smoke, noise, and flame that accompanied the firing of these weapons, and before long they were trading for, or capturing, them for themselves.

Among its drawbacks, the matchlock was far slower to load and fire than either the longbow or crossbow. It also could not compete with them in terms of accuracy. There was also the concern of an accidental discharge.

The wheel-lock improved on the matchlock but its firing mechanism was very complicated. In the wheel-lock, pressing the trigger caused the cover over the pan containing the powder to slide forward. At the same time iron pyrites known as the spanner,

Eighteenth-century muzzle-loading muskets and rifles. Virtually all military infantry firearms of the period were smoothbore muskets, which were much faster to reload but not as accurate as rifles. (Dover Publications)

clamped into a cock or dog-head, brushed against a rough-edged wheel as the latter turned, creating sparks that ignited the exposed priming powder. The great expense of the wheel-lock meant that it never completely supplanted the matchlock for military use. Wheel-locks were not uncommon in America and are known to have been present in the "lost colony" of Roanoke.

The snap-lock was an important step forward from the wheel-lock. The snap-lock employed flint and steel for the first time. Pulling the trigger opened the pan cover, while at the same time the cock swung forward, scraping the flint against the face of a piece of upright steel, pushing it forward and causing sparks to fall in the exposed pan below.

The flintlock, the last musket of the colonial period, was merely a refinement of the snap-lock in which the steel and pan cover were of one piece. It proved to be simple and effective and replaced both the matchlock and wheel-lock. The flintlock was more reliable. It was also far easier to load, safer, and could be carried for a distance. Flintlock firing followed the following procedure: half-cock the weapon (putting it on safety—the origin of the phrase "Don't go off half-cocked"); take out the cartridge and bite off the paper at the top, pouring a small bit of powder into the pan; ram the remaining powder, paper, and ball down the bore; put the musket on full cock; and pull the trigger. Here the lock struck the flint, producing a spark in the powder pan. The cover, or *frissen*, kept the powder dry and

prevented it from falling out of the pan; it opened when the flint moved forward. (The term "flash in the pan," where there is a sign of something and yet not the desired result, comes from a misfire where there would be a flash only.) The resulting flash raced through the touch hole into the barrel, and the gun fired.

A well-trained soldier could fire three, or perhaps four, shots a minute from his flintlock. Even so, the flintlock musket was a highly inaccurate and rather unreliable weapon. With the French flintlock musket, 1 misfire might be expected in every 9 shots and 1 hang fire in every 18. The flint had to be changed every 30 shots or so.

The soft lead bullet moving at a relatively low velocity had great knockdown power. As soon as it struck any resistant object, such as human flesh, it began to spread, creating frightful wounds. Because this so often removed chunks of bone, amputations remained a common occurrence.

Despite the advance made with flintlocks, European armies did not immediately forego the matchlock or the wheel-lock. In fact, all three weapons were routinely integrated along with pikes. Well into the 17th century, governments did little to standardize firearm specifications or production. Despite this, the flintlock came to dominate Western armies by the 18th century.

The main drawback to the flintlock was its lack of accuracy. Its great windage (the difference between the diameter of the bore and the diameter of the ball being fired) meant that such weapons were

Closeup of a flintlock musket. (North Wind Picrture Archives)

inherently inaccurate. Soldiers could not reliably hit a man-sized target beyond 80 yards. Substantial windage was necessary because of the slightly irregular bullet and the considerable buildup of residue in the barrel from the burning of the black powder. As a result, the bullet actually bounded down the bore ("balloting") and might take flight from the muzzle of the weapon at an undesired angle.

The inaccuracy in fire meant that most battles between infantry took place at near-dueling pistol range. In firing tactics, commanders sought to mass as many muskets as possible in a short length of firing line, expecting that sheer volume of fire would overcome inaccuracy. The result could be frightful numbers of casualties.

Spain was the first nation to introduce firearms in the Western Hemisphere. Indeed, the word "musket" comes from the Spanish *mosquete*. During his exploration of the Caribbean in the 1490s, Christopher Columbus employed primitive hand cannon.

Under the reign of Holy Roman Emperor Charles V (1519–1556), also king of Spain as Charles I during 1516–1556, the Spanish arms industry greatly expanded. The Spanish are credited with two significant contributions to firearm design. First, the trigger mechanism commonly used on the crossbow was applied to the musket; and second, wooden stocks were designed so that a musket could be fired not braced against the chest as was customary, but rather

pressed against the shoulder. The latter method allowed better aim and a greater absorption of recoil.

The common Spanish firearm was the *escopeta*, or light musket. Used by both infantry and cavalry, the *escopeta* was also employed by civilians. Unlike mainline army regiments, however, presidios and frontier outposts remained persistently underequipped. Reportedly, in all of New Mexico in 1772 there were only 250 firearms. The variety of calibers and the lack of spare parts also proved a constant problem. As a result, the Spanish tended to retain and repeatedly refurbish older weapons. Cases of 17th-century muskets being used in the 19th century were not uncommon.

The Spanish government did not officially adopt a military musket until the mid-18th century. Heavily influenced by French and German design, its Model 1751 was the first standardized shoulder weapon of the Spanish Army until replaced by the Model 1791.

Like the Spanish, the French did not adopt a standardized infantry musket until the 18th century. Initially, arms used by French troops remained at the discretion of individual commanders, as long as the weapons were flintlocks. The French, who officially abandoned the matchlock in 1699, did not adopt a regulation flintlock musket until 1717. Produced in factories at St. Étienne, Maubeuge, Brescia, Tulle, and Charleville (Nozon Manufactory), French muskets were stamped with their place of manufacture.

These weapons were routinely all known as "Charlevilles." The Model 1717—unlike British or Spanish muskets—underwent numerous changes and modifications during the colonial period. For example, in 1728, metal bands replaced pins to secure the barrel in its wooden stock, making the barrel easier to remove. In 1746, a metal ramrod replaced the older, wooden one.

The 1768 model Charleville was lightened and known as the Léger. French armories produced some 150,000 of them. It was .69 caliber with a barrel length of 44.75 inches and an overall length of 60 inches and weight of 9.47 pounds. The French shipped large numbers of the model to America, and it was the principal musket of the Continental Army in the American Revolutionary War. Later, the Charleville formed the basis of the first U.S. military musket, the Model 1795. The French generally produced high-quality muskets, and theirs remained throughout the colonial period second in quality perhaps only to British weapons.

The British, like their Spanish and French counterparts, did not adopt a standardized military musket until the 18th century. Even as late as the 1720s, British regiments purchased their own firearms. Under Queen Anne (1702-1714), however, the British Army officially adopted a standardized shoulder weapon, the socalled Brown Bess. Perhaps the most famous flintlock musket of the colonial period, it may have taken its name from "browning," the process whereby the iron barrel was treated. "Bess" may have been a corruption of the German word büsche, meaning gun, or it may have been simply a soldier's nickname. The Brown Bess was introduced into the British Army in 1720 and remained in service until the 1840s. All models were .75 caliber (three-quarters of an inch or 19 millimeters), but barrel length varied. The Long Land musket common to 1760 had a barrel 46 inches long, whereas the Short Land model, or Second Model, thereafter had a barrel 42 inches long and overall length of 58.25 inches. It weighed 8.80 pounds. The lock for both had a goose-neck cock with a convex surface. The Brown Bess mounted a 17-inch bayonet.

Besides the standard military musket, other types of shoulder weapons found in the colonies included carbines, musketoons, and blunderbusses. Carbines and musketoons were shorter muskets generally intended for so-called light infantry, cavalry, and use aboard ships. No standard archetype of either weapon existed in the colonial period, but most had barrels that measured from 28 to 42 inches in length. Sometimes carbines were rifled. The need for portable shoulder arms in the American woodlands, particularly during the French and Indian War (1754–1763), forced the British military to consider the feasibility of officially adopting such weapons.

The blunderbuss was a large-caliber weapon with a short barrel and a distinctive, flaring muzzle. Introduced to England from Holland in the mid-17th century, the blunderbuss was specifically designed to spray a large number of pellets at close range. For this reason, it was the preferred weapon of naval boarding parties and by coach guards. At sea, large blunderbusses known as "boat guns" (often mounted on swivels) could fire up to one pound of shot. Con-

trary to myth, blunderbusses did not see widespread use in the North American colonies.

One technological innovation that never became widely adopted during the colonial period was the breech-loader. Borrowing a concept first used by experiments with early artillery pieces, it was rightly believed that loading a weapon from the breech (rather than the muzzle) would prove more efficient for the soldier. However, despite widespread attempts to develop a viable breech-loader, the tolerances necessary were simply not possible with the primitive metallurgical technology of the day. Gases escaping from the breech remained a serious problem for the individual doing the firing. Expense was another factor. As a result, European and American military forces continued to employ the standard muzzle-loader well into the 19th century.

A common firearm in the British colonies, the "fowler" (also referred to as the Kentucky, American, or, most frequently, the Pennsylvania rifle) was a musket with an extra long barrel. Sometimes these barrels were more than seven feet in length. The Pennsylvania Rifle was actually based on a hunting piece introduced by German immigrants. A superb firearm with an effective range of up to 200 yards, the rifle greatly outdistanced the military musket. What made this firearm so lethal was rifling, one of the greatest innovations in the history of weapons technology.

Rifling, or lateral, twisting grooves inside the barrel that imparted a spin to the bullet, had been introduced into firearms in Europe by 1550. By spinning a bullet on discharge, rifling allowed bullets to be fired from a weapon with much greater accuracy and distance

Despite their advantages, most armies did not employ the rifle in any large numbers. An exception were specialized units of riflemen formed in the Continental Army during the American Revolutionary War.

Rifled firearms (see separate entry) were costly, and they were difficult to load. In order for the rifling to take effect, windage was sharply reduced and the ball had to be rammed hard down the bore, a time-consuming and more difficult process. Also, since European armies continued to fight in closely compacted ranks at close range well through the 18th century, "accuracy" was never a serious concern. Thus, throughout the colonial period, rifles tended to be used primarily by civilians as hunting weapons, smoothbore muskets by the military.

Over time, the British North American colonies inadvertently acquired a diverse collection of shoulder weapons. Old parts were repeatedly reused and refurbished. More often than not, colonials owned one weapon that served as both a hunting and a militia piece.

Mutiny, Army

Mutiny is the act of disobeying a lawful authority; most commonly it is applied to military service. Many of the best-known mutinies have occurred in naval forces at sea, where the meager rations, close quarters, harsh discipline, and difficult service conditions of the colonial period created almost perfect conditions for dissent within the ranks. However, mutinies have occurred in virtually every military force in every era for a wide variety of reasons.

Prior to the European colonization of North America, mutinies were typically associated with mercenary units. Mercenaries, never known for strict discipline or abject loyalty to an employer, tended to mutiny against their commanders when faced with poor supplies or a failure by the employer to pay in a timely fashion. Winter was the most common season for mutinies. Then military forces were usually in garrison waiting for the spring campaign season. Bored, poorly supplied troops in winter quarters often expressed frustration with their situation by defying the orders of their commander rather than openly revolting. The penalty for mutiny has varied, depending on the causes and outcomes of the mutinous conduct and the whims of commanders charged with quelling them. Usually, individuals found guilty of inciting a mutiny or leading one have been executed, whereas mere participants have faced lesser penalties.

During the colonial period, the European power that faced the greatest difficulty with mutiny was Spain. The conquests of the Aztec and Inca empires both included native uprisings coupled with mutinous Spanish soldiers. Perhaps the most mutinous army in history was the Spanish Army of Flanders, which experienced 45 separate mutinies from 1572 to 1607. Chief among the causes were delays in payment for the troops, who refused to acknowledge orders until they were paid.

The 1664 English attack on New Netherland (later New York) benefited from a massive mutiny by the Dutch defenders of the colony. When Gov. Petrus Stuyvesant attempted to organize a defense of the colony, the militia refused to fire a shot, and the entire territory became an English possession. In the French and English colonies, friction between regular troops and provincial forces sometimes contributed to mutinous behavior. English regulars had great difficulty in compelling colonial militia forces to submit to royal authority. When colonial troops believed that they had been

mistreated by regular commanders, they routinely deserted en masse and simply marched home. In 1675, Nathaniel Bacon of Virginia, joined by a frontier force bent on the destruction of Native American tribes in the region, mutinied against the authority of Gov. William Berkeley, eventually descending on the colonial capital, Jamestown, and burning it in 1676. Bacon's Rebellion (1676–1677) was eventually put down by Virginia and Maryland militiamen assisted by a party of English regulars. Nevertheless, it represents one of the largest and best-known examples of mutiny in the American colonies.

English colonists often used native allies in their colonial conflicts, but soon discovered that their allies had a different view of military authority. English commanders considered it mutinous when warriors refused to follow commands or left a war party for their own reasons. During the Tuscarora War (1711–1713), a party of Yamasees returned to their homes when they decided that they had plundered and captured a sufficient number of Tuscaroras to make their participation in the war worthwhile. The Carolina colonists accompanying the Yamasees protested but could not stop what they viewed as a mutiny.

During the colonial wars between European powers, mutiny within regular units was almost unheard of, or went unreported by European commanders. Mutinies by provincial units, typically of the mass desertion variety, went unpunished by colonial authorities. During the American Revolutionary War (1775–1783), mutiny became almost an annual occurrence in the Continental Army, particularly when the army was in winter quarters and rations were scarce. In the winter of 1780–1781, General George Washington was forced to use French troops to quell a mutiny led by members of the Pennsylvania line, who were upset about poor food, inadequate clothing, and short supplies provided by the Continental Congress.

Mutiny, Navy

Mutiny is the disobeying of a lawful authority, most commonly applied to military service. Group resistance to discipline has been a continual facet of military organizations but has been particularly prevalent aboard ships. Typically, mutinies have been spontaneous

refusals to obey orders or persist in difficult service conditions. They have tended to be passive rather than active and most have been of a short duration. Although mutinies can occur in any branch of military service, and under almost any conditions, most people associate the term "mutiny" with shipboard actions.

Mutinies, though not limited to naval vessels, have historically occurred most often aboard ships. During the colonial period, service conditions aboard European vessels created almost perfect conditions for mutinies. On most vessels, living space for sailors was extremely cramped, food rations and medical care were poor, and discipline was very harsh. Voyages, lasting months or even years, consisted of isolation from any potential outlet for discontent among the crew.

The penalty for mutinous conduct has varied by time, severity of the behavior, and the whims of individual commanders. According to the Articles of War governing behavior in the British Royal Navy, mutiny was punishable by death. Some captains found negotiations more effective than brute force in ending mutinies, however. Captains whose crew mutinied faced the possibility of developing a poor reputation, and thus it is likely that shipboard activities fitting the literal definition of mutiny were not always reported as such. Although 4 of the 36 Articles of War defined mutiny and prescribed death as its punishment, the ship captains had tremendous leeway in enforcing discipline.

Naval mutinies are not limited to military forces during wartime. Many of the great European exploration voyages included mutinous conduct. During his attempt to circumnavigate the globe, Ferdinand Magellan faced a mutiny led by three of the five captains in his fleet while anchored off the coast of Brazil. One of the captains was killed during the mutiny, another was executed, and a third was marooned after a court-martial. Sir Francis Drake endured a similar rebellion 58 years later after navigating the Strait of Magellan. Like his predecessor, he ordered the execution of the mutiny's leader after a court-martial. Naval mutinies could also be triggered by the practice of impressment, or the forcible enlistment of personnel to serve in armies or onboard ship. With a crew containing enough impressed sailors, who would naturally be disinclined toward discipline, mutiny would never have been very far off.

Probably the most famous mutiny in history occurred on April 28, 1789, aboard HMS *Bounty*, but the largest and most widespread mutiny in the British Royal Navy occurred during the wars of the French Revolution (1789–1799). In 1797, seamen at Spithead, England, demanded an increase in wages, an end to impressments, an improvement in rations, and a reduction in shipboard punishments. The initial reaction of the Admiralty was to react with force, but in time, the Admiralty settled on a negotiated end to the revolt. As such, the collective mutiny at Spithead took the form of a labor strike rather than a rebellion. In the end, the Admiralty offered amnesty to the mutineers, approved an increase in wages, and removed the officers identified as the strictest disciplinarians in the fleet.

Mystic Fort Fight

Event Date: May 26, 1637

Assault on a palisaded Pequot community near the Mystic River in present-day Connecticut on May 26, 1637. The attack was carried out by a force of English settlers and their Native American allies. The Mystic Fort Fight became the central event of the Pequot War (1636–1638). It resulted in the immediate deaths of hundreds of men, women, and children, and led to the longer-term subjugation of the tribe to the Mohegans and the Narragansetts. These two tribes had assisted the English colonists.

Following the outbreak of the conflict with the Endicott expedition of September 1636, hostilities for the next six months revolved around Pequot harassment of the English at Fort Saybrook, at the mouth of the Connecticut River. But in late April 1637, Pequot warriors raided Wethersfield, an English settlement further up the river, killing 6 men, 3 women, and much livestock, and capturing 2 girls. A week later, on May 1, the General Court of the Connecticut Colony declared "offensive war" on the Pequots. It duly sent 90 men under Captain John Mason on a retaliatory mission.

Shortly thereafter, Mason's force arrived at Fort Saybrook accompanied by a number of Mohegan warriors under their leader Uncas. There Mason met a smaller group of 20 men under Captain John Underhill, sent out by the colony at Massachusetts.

Mason's original orders specified that he attack the main Native American settlement on the Pequot River. However, after considering the difficulties of such an attack, and in consultation with other officers and the expedition's cleric, Mason decided to move his force to Narragansett Bay. From there he planned to attack another large fortified Pequot settlement on the Mystic River.

On the evening of May 23, 1637, Mason landed with about 70 men from Connecticut, 19 from Massachusetts, and some 70 Mohegan warriors. He negotiated with Miantonomo and other Narragansett leaders to pass through their lands and marched his forces westward the following day. The English and the Mohegans then encamped outside, and surrounded, an Eastern Niantic village, a precaution to ensure that none alerted the Pequots of their approach. They did so also because of the Niantics' antagonistic attitudes.

Estimated	Casualties	during	the My	vstic For	t Fight

	Killed	Wounded	Captured	Escaped
Colonial troops	2	20	0	0
Colonial-allied Indians	Unknown	Unknown	0	0
Pequots	400-700	0	7	7

On the morning of May 25, several hundred Narragansett warriors joined Mason's expedition. The weather was hot and the march was a difficult one. Many of the Narragansetts abandoned Mason when his forces reached the Pawtucket River, which was their boundary with Pequot land.

The men rested during the night, then began their attack around daybreak on May 26, 1637. The attackers first surrounded the village and fired a musket volley, surprising the sleeping Pequots inside. Then, divided into two forces—one each under Mason and Underhill—the men simultaneously assaulted the two entrances in the palisade. The Pequots defended themselves with bows and arrows and in hand-to-hand combat. Although the original English intention was to kill the inhabitants, the attackers found the struggle difficult in the tight quarters among the Pequot wigwams, leading their commanders to decide to set fire to the village. The conflagration soon engulfed the settlement, with numerous Pequots dying in the blaze and many warriors fighting to the last. Other Pequots fled the village, but almost all those attempting to escape were slain by the English or their Native American allies.

Combat did not end with the destruction of Mystic village, however. Mason's force then had to continue on to the Pequot River to rendezvous with their ships. During the march, warriors from the other main Pequot settlement attacked, although the English effectively kept them at bay. Mason's march was slowed by the exhaustion of his men and the need to transport the wounded. The English reached their vessels later that day.

English casualties for the campaign amounted to 2 killed and 20 wounded; casualties among the accompanying Mohegan and Narragansett warriors are unknown. Estimates of Pequots slain at Mystic range from 400 to 700 people. Mason claimed that only 7 were taken captive and 7 escaped. Pequots elsewhere scattered after the assault, with many later hunted down by the English and their native allies. Although these operations did not result in the wholesale slaughter witnessed at Mystic, hundreds of Pequots were forced into servitude by the English or were incorporated into the Narragansett or Mohegan tribes.

N

Nairne, Thomas

Born: ca. 1672 Died: April 18, 1715

British military adventurer, diplomat, politician, and trader and the first official Indian agent in South Carolina. Thomas Nairne was most likely born in northern Scotland around 1672. Little is known of his early life or when exactly he went to Carolina. Nevertheless, by 1700 he had established himself as a planter in the colony.

In 1704, Nairne made a name for himself through his involvement in Thomas Moore's 1704 campaign against the Spanish-allied native towns of Florida. Most of Nairne's career, however, was devoted to improving English alliances with the Creek, Cherokee, Chickasaw, and Choctaw tribes. He also enlisted their support for English attacks against the French colony of Mobile, established in 1702. Beginning in 1706, Nairne was a member of the South Carolina Assembly.

Fearing French ambitions toward Carolina and hoping to solidify Anglo-native relations, the proprietary government appointed Nairne as Carolina's first official Indian agent in July 1707. The following winter, Nairne made a lengthy trip from Carolina to the Mississippi River. Once there, he enlisted native support for a British assault against Mobile. The natives happily accepted Nairne's gifts, but few supported the attack. Nairne's accounts of the journey, however, provide some of the richest and earliest English accounts of southeastern Native American ethnography. Nairne ended his mission imprisoned in the Charles Town (present-day Charleston) jail, falsely accused of treason by his political opponent Nathaniel Johnson, proprietary governor of South Carolina.

While in prison, Nairne made his most valuable contributions to the history of Anglo-native relations in the southeast. A manuscript map that he drew of his travels provided British cartographers with a wealth of new details on the native peoples of the southeast. More important, Nairne attached to his map a commentary that would form the nucleus of Britain's native policy for the remainder of the 18th century. In it, he emphasized the French threat and suggested aggressive British involvement in Native American affairs as a remedy. The British, he argued, needed to cultivate native alliances through trade, construct forts in the Tennessee Valley, and establish buffer colonies south of the Savannah River. Nairne's plan would not become official British policy until the 1720s.

Cleared of all charges by 1710, Nairne was once more elected to the assembly. He resumed his role as Indian agent in 1712, entering into frequent discussions and negotiations with the region's native tribes. He tried, unsuccessfully, to put an end to the shady dealings in which some white traders had engaged with Native Americans. In 1715, on the outbreak of the Yamasee War (1715–1717), Nairne attempted to negotiate a peaceful resolution to the conflict but was murdered by a group of Yamasee warriors on April 18, 1715.

Nansemonds

An Algonquian-speaking Native American tribe inhabiting an area south of the James River in eastern Virginia. The Nansemonds lived in villages along both sides of the Nansemond River near the present-day city of Suffolk. Their chief (or *werowance*), lived near Dumpling Island on the Nansemond River in the vicinity of Chuckatuck. The way of life of the Nansemonds was similar to that of other natives of the eastern woodlands. They lived a semisedentary existence, moving closer to food supplies based on the season. The men engaged in hunting, fishing, and war, while the women tended gardens and to domestic chores.

At the time of the founding of Jamestown in 1607, the Nansemonds could muster about 300 braves in a population estimated to have numbered about 1,200. Prior to the arrival of the English, the tribe had been defeated by Chief Powhatan, who compelled the Nansemonds to join the Powhatan Confederacy.

The earliest Nansemond encounters with the English were hostile because of raids carried out by the latter on Nansemond villages. Captain John Smith wrote that two English emissaries had been sent to negotiate the purchase of an island from the Nansemonds in 1608; however, they were tortured and killed. Led by captains John Martin and George Percy, the English in reprisal drove the Nansemonds off the island, burned their dwellings and assembly buildings, and desecrated the resting places of their dead. As English settlers moved into the area of the Nansemond River to farm the rich land there, fierce Nansemond resistance continued. In 1622, the Nansemonds participated in the March native uprising that precipitated the Second Anglo-Powhatan War (1622–1632).

The Nansemonds temporarily mitigated their hostility toward the English in 1638. That year saw the colonist John Bass marrying a Nansemond woman. Converted to Christianity, she was given the baptismal name of Elizabeth. It is believed that everyone in today's Nansemond tribe is descended from that marriage. The unconverted Nansemonds remained hostile toward the English, making war against them again in 1644 during the wider Third Anglo-Powhatan War (1644–1646). After the conflict, they fled southwest toward the Nottoway River. There the Virginia colonial government assigned them a reservation in the Hampton Roads area. In the late 1600s, the Nansemonds split into two main groups. The Christianized Nansemonds remained along the Nansemond River as Englishstyled farmers. The others stayed on the land reserved for them. After 1744, the reservation was abandoned because the Nansemonds preferred living with the Nottoways on the Nottoway reservation. The old Nansemond reservation was sold in 1792, and the last of these Nansemonds died on the Nottoway reservation in 1806.

The Christianized Nansemonds subsequently moved to an area northeast of the Great Dismal Swamp. The area had few English settlers and was well suited to their way of life. On May 29, 1677, the Nansemonds along with the Pamunkeys and the Appomattocks signed a peace treaty with the English. By this agreement, known as

the Treaty of Middle Plantation (the Virginia-Indian Treaty of 1677/1680), they became tributaries of the English Crown.

Narragansetts

Native American group inhabiting southeastern New England. The Narragansetts lived in present-day Rhode Island, although their authority frequently extended south to Long Island and Block Island. Other area tribes that fell under Narragansett control were the Pawtuxets, the Niantics, the Manisseans, the Cowesets, and the Shawomets. Some Nipmucks and Montauks were also beholden to the Narragansett sachems (chiefs). The Narragansetts came to be known by Europeans through their relationship with Rhode Island founder Roger Williams. Williams was exiled from Massachusetts Bay because of his unconventional ideas, especially in regard to religion. His relationship with the Narragansetts helped him pen *A Key into the Language of America*, written in 1643. It is from this account that much of the knowledge of the Narragansetts is derived.

The Narragansetts spoke an Eastern Algonquian language and were governed politically by two sachems, usually an uncle and a nephew. In addition to cultivating maize, squash, beans, and similar crops, the Narragansetts fished and hunted. Because wampum was usually made of shells, the abundance of quahogs (a large clam indigenous to the northeast) and whelks ensured that the Narragansetts dominated the wampum trade. Indeed, by the mid-1620s, the tribe had grown quite wealthy by its control of the wampum trade. Wampum was often used as money for trade, gifts, and even diplomacy, allowing the Narragansetts to develop strong trading ties and tributary relationships with other tribes of New England. When English settlement developed in New England in the 1620s, the Narragansett were thus quite powerful. Fortunately for them, they had avoided the devastating epidemics of 1616–1619 that had diminished many Native American nations.

During the Pequot War (1636–1638), Williams persuaded the Narragansetts to ally themselves with Massachusetts Bay. The English were intent on a preemptive attack on the Pequots and Narragansett assistance was critical. Accompanying the English to Mystic Fort in 1637, Narragansett warriors were appalled by the behavior of the English, who burned the entire village. Most Pequot adult males were away from Mystic preparing for war, so primarily

Roger Williams lands at Providence Plantation in 1636 and is greeted by members of the Narragansett tribe. (Library of Congress)

women and children remained. As the village burned, fleeing survivors were shot outside the walls. The Mystic Fort Fight killed as many as 700 Pequots and essentially annihilated the tribe. During the fighting, the English had attacked some 20 Narragansetts in the mistaken belief that they were Pequots.

In the 1640s, the colonies of Massachusetts, Connecticut, and Plymouth formed the New England Confederation. The loose union was meant to be a military alliance. In 1643, when Narragansett sachem Miantonomo sold a large parcel of land to an enemy of the Puritans, the confederation-allied Mohegans murdered him. Threatened with war, the Narragansetts submitted to the power of the English king, though not to the colonists. However, in 1644, a treaty between the two groups placed the Narragansetts in a subordinate position, and they continued to lose ancestral lands to the colonists.

Into the 1670s, the English continued to covet native lands. Wampanoag leader Metacom, also known as King Philip, organized attacks against the English settlements. In July 1675, the Wampanoags attacked outlying settlements of Plymouth Colony, sparking King Philip's War (1675–1676). With their initial success, other

tribes joined in the attacks against remote colonial towns. Although the Narragansetts tried to remain neutral while covertly aiding the Wampanoags, the English managed to drag them into the fighting. In retaliation for native attacks, the English organized a force of some 1,000 men who attacked the Narragansetts in late 1675. This offensive culminated in the devastating Great Swamp Fight of December 19, 1675, in which more than 600 Narragansetts died. At least 300 more became prisoners. The Great Swamp Fight was one of the bloodiest battles of the war and deeply demoralized the tribe, although afterward the Narragansetts openly assisted Metacom. King Philip's War raged on with sporadic attacks until the spring of 1676. Hunger and disease drove many warriors from the field, and Metacom was killed during the summer. Afterward, the English sold many of the native captives into slavery and imposed strict regulations on those that remained.

After King Philip's War, the Narragansetts ceased to exist as an independent entity. They joined together with the Niantics. Over the next two centuries, they assimilated with American culture as the only way to survive. The language and last full-blooded

Narragansetts died in the 1800s. Although the Narragansetts were detribalized in 1880, activists were able to regain recognition of the tribe in 1983.

Narváez, Pánfilo de

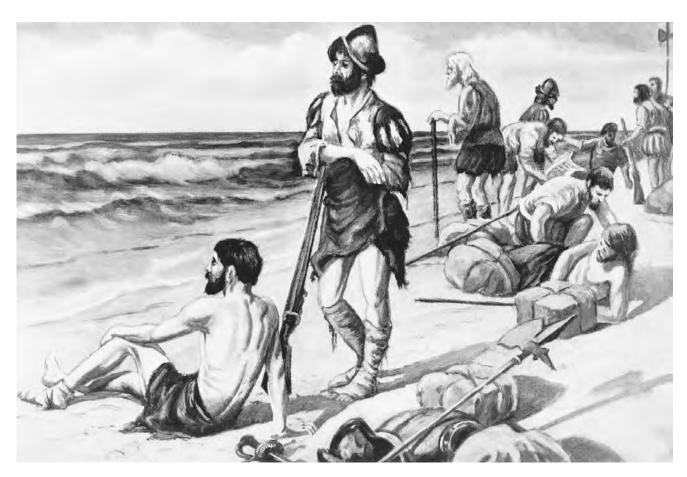

Born: ca. 1480 Died: 1528

Spanish explorer and conquistador who led an ill-fated expedition to Florida in the early 16th century. Pánfilo de Narváez was born in

Tidels or Valladolid, Spain, probably in 1480. As a conquistador, Narváez assisted in the conquest of the island of Cuba in 1511. In 1519, on the orders of the Spanish governor of Cuba, Juan Velasquez, Narváez tried to seize and imprison Hernán Cortés and claim Mexico for Velasquez. When this dispute was adjudicated by the king in Spain, Charles V took the side of Cortés, although he granted Narváez land in southeastern North America in 1526.

In 1528, while sailing to the northern Gulf Coast to claim his grant, Narváez accidently landed on the western coast of Florida after a storm drove his fleet of five ships off the coast of Cuba. Narváez decided to land to replenish his water supply and take advantage of the unintended detour to explore. He set out north, believing that he was headed toward Bahía Honda (Tampa Bay). Not realizing he was already north of the location he intended to explore, Narváez marched his 300 men northward after he sent his ships ahead to meet them. He never saw the ships again. Narváez's men arrived at the Withlacoochee River, but not finding a bay at its mouth, they headed inland along the river. The party encountered several Timucua villages and from there they headed north in northwest Florida.

In territory settled by the Apalachees, Narváez found the natives more numerous and food resources more abundant, but there was no gold. On encountering the first Apalachee village, Narváez

Artist's depiction of Spaniard Pánfilo de Narváez (center), who led an expedition to the Gulf Coast in 1528 to establish a settlement that would end in disaster. Narváez himself was swept out to sea on a raft and drowned. (Bettmann/Corbis)

ordered an immediate attack. From that point forward, however, the Spanish remained under constant attack by the Apalachees.

Finally low on supplies, the expedition headed west to the coast in the hopes of meeting its ships. When the men reached the Gulf of Mexico, the ships were nowhere to be seen, so they built rafts, trying to reach Mexico by sailing along the coastline. During a sudden storm in November 1528, Narváez, who was offshore on a raft, was suddenly swept out to sea and lost. Only a handful of survivors of the expedition finally made it to Mexico after wandering for several years in what is today the southwest United States and northern Mexico. One of the survivors, Álvar Núñez Cabeza de Vaca, published a record of their travails, and this narrative later inspired Hernando de Soto to explore the Southeast and Francisco Coronado to explore the Southwest in attempts to locate the rich lands and cities of gold that Cabeza de Vaca claimed in his narrative to exist. Another survivor of the Narváez debacle, Juan Ortiz, was later found in Florida by the de Soto expedition and proved to be an invaluable guide and translator.

Natchez

Native American group inhabiting the area now known as the southwestern part of the state of Mississippi. The center of their culture was present-day Natchez, Mississippi. Their language, related to the Muskogean language family, indicates that they were related to other Native American groups in the lower Mississippi River Valley. The word "Natchez" was the name of their principal settlement, and it was the Europeans who gave that name to all of them. The Natchez were successful farmers and grew corn, beans, and squash. They also hunted and fished.

The first European to encounter the tribe was Hernando de Soto in 1543. The nation was first designated Natchez in March 1682, when René-Robert Cavelier, Sieur de La Salle, descended the Mississippi River. In the Natchez, La Salle found the strongest Native American nation in the area. Of the American Indian groups to survive the wars and disease that came with de Soto's arrival, the Natchez retained much of their Mississippian mound-building culture, the monarchy, and their so-called Sun Caste.

Natchez society was organized as a chiefdom. It was highly stratified and organized into nobles and commoners; the highest level was known as the Sun Caste. Social standing was determined through the female line. The Natchez chief, known as the Great Sun, inherited his position from his mother's family. Natchez kings were

Depiction of Natchez Native Americans hunting deer by Antoine-Simon Le Page du Pratz, ca. 1758. (Library of Congress)

afforded every honor, such as being transported on a litter wherever they went. Indeed, no king's feet were allowed to touch the ground in travel. When a member of the Sun Caste died, many of his family and friends were buried with him in ritual sacrifice.

The Natchez were mound builders. This had to do with their tribal religion, and they erected sacred buildings on these flattopped ceremonial mounds. Periodically, the dispersed Natchez families gathered at the mounds for social and religious events.

As with other Native Americans, the Natchez fell prey to the consequences of contact with the Europeans and their diseases. Indeed, disease accounted for far more casualties than those lost to war. To replace their dwindling numbers, the Natchez turned to the custom of incorporating smaller groups into their nation.

Following the arrival of La Salle and Christian missionaries in the early 18th century, relations with the French remained relatively cordial. Indeed, a large number of Natchez had been baptized by the early 1700s. By 1713, the Natchez were involved in the lucrative task of capturing American Indian slaves for the colonial market. This human trade was a major factor in the eventual extinction of smaller, less-powerful tribes.

Relations with the French were not always peaceful, and in 1715 the First Natchez War began. Its basic cause was European encroachment on land the Natchez considered theirs. Following the murders of four Frenchmen, the French governor of Louisiana, Antoine de La Mothe, Sieur de Cadillac, ordered the commander of the Mississippi River, Jean-Baptiste Le Moyne de Bienville, and 34 French troops to deal with some 800 Natchez warriors. Recruiting additional manpower, Bienville moved into Natchez territory and succeeded by ruse and the taking of a number of Natchez nobles hostage, to get the Natchez chiefs to execute the 6 murderers. Bienville then secured the assistance of the Natchez in the construction in 1716 of Fort Rosalie (present-day Natchez, Mississippi).

French settlers continued to settle on Natchez lands. English agents were also active trying to stir up the Natchez against the French. Finally, in November 1729, the commandant at Fort Rosalie provoked the Natchez into revolt. The Natchez killed or captured hundreds of French colonists before French reinforcements and superior weaponry turned the tide. The Natchez finally capitulated in January 1731. Four hundred natives surrendered and were deported to Santo Domingo as slaves.

At war's end in 1733, the remainder of the Natchez fled to the Chickasaw Nation in northern Mississippi, where they received refuge. The French subsequently fought two unsuccessful wars with the Chickasaws to have the refugee Natchez handed over to them.

Eventually, the Natchez who had fled to the Chickasaws split into three groups. One joined the Upper Creeks in what soon became Georgia, the second joined the Cherokees to the north, in what would become Tennessee, and the third group fled to South Carolina. Today, the Edisto Nation of South Carolina identify themselves as the Kusso-Natchez.

Natchez Revolt

Event Date: November 28, 1729

Uprising by the Natchez against the French in November 1729. In 1716, the French constructed Fort Rosalie, situated along the eastern bank of the Mississippi River and among the Natchez people. This activity was part of an effort to monopolize the fur trade in the Mississippi River Valley.

Natchez relations with the French were tenuous at best, with sporadic episodes of open warfare. In 1728, Sieur de Chepart, a notoriously brash individual, replaced a fairly popular French commander at the Natchez post. His relations with the Natchez were deplorable. Particularly distasteful had been his order for one Natchez village to relocate to make room for a French plantation. Word quickly spread to all Natchez villages of an impending revolt designed to rid the region of the French and prevent further encroachment.

During the fall of 1729, Natchez villages held celebrations and ceremonies in preparation for the attack. They displayed elaborate decorations and ornaments while Natchez warriors swore to fight to the death for their people. During these autumn months, French settlers began reporting rumors of an impending attack. Chepart dismissed them.

On November 28, 1729, the Natchez began to carry out their planned attack. Natchez warriors moved throughout the French community asking for arms and ammunition for a hunt, promising some of the meat in return—something that did not raise suspicions. With 2 or 3 warriors at each French house, the Natchez simultaneously fell on the French inhabitants at the sound of firing at the commandant's house. Within hours, 145 French men, including Chepart, 36 women, and 56 children, had been killed, nearly a tenth of the white population in Louisiana. Almost 300 black slaves and another 50 white women and children were carried off into captivity.

The Natchez Revolt shocked the colony of Louisiana, and it halted French settlement around the fort, but the resulting Natchez War (1729–1733) between the French and Natchez ultimately proved disastrous for the Natchez peoples.

Natchez War

Start Date: December 1729

End Date: 1733

The last of three conflicts between the French and the Natchez, who lived along the Mississippi River near present-day Natchez, Mississippi. The Natchez War escalated into a regional struggle to include the English as well as a sizable number of southern and northern tribes. Although the Natchez were decimated and ceased to function as an independent people after the conflict, the war nevertheless accelerated the erosion of French authority and influence in Louisiana as well as in North America as a whole.

The French and the Natchez had fought previously in 1716 and again in 1722 without reaching any substantial accommodation. Although the French routinely disregarded Natchez culture, other tensions added to this volatile political and military environment. Through their trading partners, the Chickasaws, the British relished antagonizing tribes within the French sphere of influence. The Chickasaws goaded the Natchez by insinuating that they were merely minions of the French. A flash point occurred in 1729, when the commandant of Fort Rosalie, Sieur de Chepart, demanded that the Natchez vacate a village containing a sacred burial mound to make room for his plantation.

On November 28, 1729, the Natchez rose up in a general revolt that targeted the entire French population within their reach. Roughly 550 French citizens and slaves were killed or captured, with the mutilation and torture of men not uncommon. Some slaves were freed and encouraged to join the fight.

The French assembled an army in Louisiana dominated by 1,500 Choctaw warriors and proceeded into the Natchez heartland. Ensconced within a fort strong enough to resist cannon, the Natchez taunted their attackers with promises that the Chickasaws and the English would soon come to the rescue. This move only heightened preexisting French suspicions that outside agitation had prompted the Natchez to rebel. While negotiations were being conducted for the release of women and children, the Natchez quietly left the fort and scattered. One group was captured by Choctaw and Chackchiuma warriors while trying to reach the Chickasaws in early 1730. Some 150 men were executed, whereas women, children, and slaves were freed. The main body of the Natchez was discovered later in 1730 on an island in the Mississippi. Following a French artillery bombardment, the defenders were largely decimated. Another sizable contingent was captured by the French and their Caddo allies near Natchitoches, Louisiana. The group was subjected to a wholesale massacre. Some Natchez escaped to live among the British, the Creeks, and the Cherokees. But the largest collection of escapees, about 1,000 to include 200 warriors, settled among the Chickasaws in 1731.

Believing the Chickasaw tribe responsible for the war, the French recruited aggressively among northern tribes for mercenaries to launch a retaliatory strike. The Hurons and the Illinois responded in the greatest numbers. The French did not officially declare war on the Chickasaws, as they hoped to deal with the remaining Natchez first. A raid in September 1730 by northern warriors killed or captured some 50 Chickasaw men, but the French feigned ignorance when queried on the motives for the attack. The Chickasaws had some success in using gifts and peace messages to dissuade these distant foes from attacking. Chickasaw counterattacks on northern villages enhanced their reputation as the fiercest of tribes east of the Mississippi.

Emboldened by their virtual genocide of the Fox in the Illinois Country in 1730, the French intensified their efforts to eradicate the Natchez by demanding that the Chickasaws turn over refugees and cease trade with the British. When the Chickasaws refused, French authorities arranged for the Choctaws to burn three Chickasaw prisoners at the stake. By February 1731, there was a clamor among the Choctaws for joining the war, in part because of a rumor that the British had poisoned some cloth acquired through trade. But Red Shoes, an ambitious chief cultivated by the French, objected as part of an effort to play off the European powers against one another. The existence of heavily fortified Chickasaw towns further discouraged the Choctaws. But the Chickasaws were plagued by internal divisions of their own concerning the utility of harboring the Natchez. As the pro-Natchez faction gradually prevailed, the Choctaws grew less reluctant to attack their traditional rivals. With Red Shoes settled on a course of war, Choctaws assaulted a Chickasaw hunting party in July 1731 to secure scalps and prisoners.

As the conflict widened, the Choctaws grew adept at using decoys to lure away major Chickasaw forces before raiding their camps. Suffering heavy casualties, the Chickasaws angled for peace with the Choctaws in order to isolate the French. But French officials were adamant that the surrender of the Natchez must accompany any settlement. By the end of 1732, the French-Choctaw alliance was deteriorating over the French refusal to provide troops for native offensives. On the outskirts of New France, Louisiana ranked low among priorities in asserting French authority.

By 1733, the Chickasaws were weakening in their resolve to stand by the Natchez in the face of this lengthy conflict. A Chickasaw chief known as Courcerai parleyed with the French that spring to secure peace in exchange for handing over all available Natchez. But the French governor of Louisiana, Jean-Baptiste Le Moyne de Bienville, later incarcerated him in likely retaliation for the capture of two Frenchmen. Courcerai was never heard from again. Meanwhile, the French grew desperate for the Choctaws to demonstrate the sort of initiative lacking among themselves. French officials often assumed cowardice when faced with Choctaw timidity. But Choctaw warriors readied themselves for combat through a series of elaborate rituals deeply rooted in their culture. Expeditions hastily contrived by the French clashed with Choctaw norms and

ruined their fighting spirit. In 1733, the Chickasaws concluded a peace with the northern Choctaws that encouraged an abatement of hostilities. When the Chickasaws closed the Mississippi River to French commerce in 1734, the stage was set for another conflict. Only then would the French mount an expedition of their own against the Chickasaws that failed in 1736.

Native Americans

The term "Native Americans" refers to the first inhabitants or indigenous peoples of North America and their descendants. Most scholars, using anthropological, archaeological, and genetic evidence, now agree that the first Native Americans migrated to the Western Hemisphere between 11,000 and 35,000 years ago. This migration took place in four distinct episodes across a land bridge that connected Siberia with Alaska. The last ice age created the land bridge by lowering the sea level.

Although many native groups in North America maintained a nomadic lifestyle, other groups developed sedentary societies, especially in the Southwest and the eastern woodlands. Europeans first encountered American Indians in North America in the late 15th and early 16th centuries. They found some groups organized into relatively simple bands and others organized into complex chiefdoms and confederacies. There numbered more than 500 different native groups in North America speaking as many as 2,000 different languages and dialects. European contact and then settlement wrought havoc on American Indian societies. European diseases to which the natives had no natural immunity or resistance killed untold thousands. European settlement and constant land grabs disrupted the societal and political orders of virtually every nation or tribe. Land disputes with the Europeans also brought destruction to native societies, as many of them resulted in violence and war. By the end of the colonial period, most Native American populations had been decimated.

Important Native American Tribes during the Colonial Era

Tribe	Location	Major alliances/Interactions
Abenakis	Northern New England and Quebec	French
Algonquins	Ottawa River Valley	French
Apalachees	Florida panhandle	Spanish
Appomattocks	Eastern Virginia	Powhatan Confederacy
Calusas	Southwestern Florida	Spanish
Catawbas	Western Carolinas	British
Cayugas	Finger Lakes region of New York	Iroquois Confederacy
Cherokees	Southern Appalachian Mountains	British
Chickasaws	Northern Mississippi and Alabama	British
Choctaws	East-central Mississippi and Alabama	French and British
Creeks	Florida, Georgia, and Alabama	Spanish, French, and British
Delawares	Delaware, New Jersey, southeastern New York, and southeastern Pennsylvania	British
Esopus	Hudson and Delaware River Valleys	Dutch
Hurons	Southern Ontario and southeast Michigan	French
Illinois	Upper Mississippi River Valley	French
Kickapoos	Green Bay and Fox River regions	French
Mahicans	Upper Hudson River Valley	Dutch and French
Mingos	New York	British
Mohawks	Upstate New York	Iroquois Confederacy
Mohegans	Connecticut, Massachusetts, Rhode Island	British
Narragansetts	Southeastern New England	British
Natchez	Southwestern Mississippi	French
Nipmucks	East-central Massachusetts	British
Nottoways	Southeastern Virginia and northeastern North Carolina	British
Ojibwas	Upper Great Lakes	French
Oneidas	Central New York	Iroquois Confederacy
Onondagas	Upstate New York	Iroquois Confederacy
Osages	Upper Mississippi and lower Missouri River Valleys	French
Ottawas	Manitoulin Island and northern Lake Huron	French
Pamunkeys	Tidewater Virginia	Powhatan Confederacy
Pennacooks	New Hampshire	British
	Southeastern Connecticut	British
Pequots Pueblos	Upper Rio Grande River Valley	
		Spanish French
Quapaws	Lower Mississippi River Valley	
Rappahannocks Senecas	Tidewater Virginia Western New York	Powhatan Confederacy
Shawnees	South Carolina, Tennessee Cumberland River Basin, and southern Illinois	Iroquois Confederacy French and British
Tequestas	Miami River and coastal islands of southeastern Florida	Spanish Franch
Tunicas	Louisiana region	French
Tuscaroras	Eastern North Carolina	Iroquois Confederacy
Wampanoags	Narragansett Bay to Cape Cod	British
Yamasees	Central Georgia and North Carolina	Spanish

Native Americans, Alliances with Europeans

Diplomatic, trade, or military alliances existed between Native Americans and the colonists from the beginning of European settlement. Native Americans and Europeans created numerous alliances in the colonial period, most of which collapsed soon after agreement. Common in these compacts was the desire on the part of native tribes to secure allies against neighboring tribes and other

Europeans and to acquire trade goods, specifically weapons. For the Europeans, the chief motivations were the desire to secure provisions in times of need (especially in the early period of colonization), allies against hostile natives and competing European powers, and access to native land.

Colonists of all the major colonial powers present in America sought such alliances. Although alliances were dynamic and changed often, tribes in alliance with the Spanish included the Timucuas, the Apalachees, the Guales, and the Pueblos. Among tribes in alliance with the English at various times were the Powhatans, the Pequots, the Wampanoags, the Cherokees, the Yamasees, the Chickasaws, the Narragansetts, and the Iroquois Confederation. The French were by far the most successful in securing native alliances. Locked in a struggle for North American mastery with the far more numerous English,

the French spent considerable sums on the "king's presents" to the native peoples in order to secure their loyalty and manpower in time of war. The French were also much more tolerant in their attitudes toward the native peoples and were more likely to marry and live among the natives. Tribes in alliance with the French included the Algonquins, the Illinois, the Hurons, and the Choctaws.

In the first contacts between the colonists and natives, the alliances were simple and direct, involving only local representatives of both sides and usually an exchange of goods. With continued contact, the demands on both sides became greater and the alliances involved entire colonies and native nations. The natives were particularly anxious to secure firearms and trade goods, and the colonists took advantage of this to cement alliances against another colonial power or hostile native group and to secure pelts. Alliances between Europeans and natives on occasion involved exchanges of captives.

As with other alliances, these arrangements were hardly ever static. Intertribal confederations often presented a problem. As tribes shifted locations, new alliances and confederations developed. Sometimes these confederations uniformly bound all villages of the confederation into alliances undertaken with colonists. More often than not, however, elements of these confederations split their allegiances between neighboring European powers. Examples of such instances include the Upper and Lower Creeks, who divided their loyalties between the Spanish and the English. The Chickasaws also experienced divided loyalties between the English and the French. To the north, the French and the English competed for the allegiance of the Huron and the Iroquois peoples.

No matter which native tribe or European power was involved in the process, each party sought security for its own people and a means of prosperity through the compacts. The ability of the Europeans to tap into considerable weaponry and other military and population resources often gave them diplomatic advantage. However, Native American knowledge of the land and its resources, and competing European powers allowed larger tribes to exert considerable influence.

Native American Trade

Europeans and Native Americans regularly exchanged Europeanmade items for furs. Both groups often used trade to create and cement offensive and defensive alliances. In general, the Native American trade network consisted of the exchange of Europeanproduced items such as metal weapons and utensils, cloth and clothing, alcohol, and trinkets for furs that had been trapped and dressed by Native Americans, as well as deerskins and foodstuffs, and occasionally native slaves.

Although it carried distinct economic connotations for American Indians, this trade also contained spiritual and diplomatic elements that required trading partners to become allies in warfare. The European colonial powers of England, France, the Netherlands, Spain, and Sweden fought for control in North America and continually attempted to co-opt this indigenous process to achieve their imperial agendas in North America. The inclusion of the European powers in these indigenous trade and alliance systems and European attempts to manipulate them often increased the level of hostilities among the native peoples of North America. Additionally, the new weapons introduced by Europeans, such as knives, hatchets, and muskets made native warfare more dangerous.

The nature of Native American trade varied according to the region. In the northern English colonies, French Canada, the Great

Depiction of a colonist trading goods with Native Americans. (Frank Grizzard)

Lakes, and the Ohio Valley, the trade centered on the exchange of beaver pelts for European goods. At first, the Hurons in Canada and the powerful Iroquois Confederation in present-day New York controlled the flow of trade to the interior tribes in the North. By the late 17th century, the Five Nations had defeated the other tribes of the region in a series of bloody wars known as the Beaver Wars. From that point forward, the Five (later Six) Nations controlled trade until the end of the French and Indian War in 1763.

On the European side, the French vied first with the Dutch for the northern Native American trade. That remained the case until the English replaced the Dutch in the second half of the 17th century. Although a majority of the northern native peoples ultimately allied and traded with the French, the English held the upper hand because of their alliance with the Iroquois Confederation (Five Nations).

In the Southeast, English and French traders competed with each other and the long-established Spanish mission system for Native American trade in the late 17th and early 18th centuries. In this region, American Indians traded war captives (or Native American slaves) and deerskins to the English primarily for guns and ammunition. The French and the Spanish did not participate in the slave trade, but did accept deerskins for a variety of trade items. The inability of the French to provide sufficient numbers of muskets to their native allies and the reluctance of the Spanish to provide firearms for their missionized natives led to the victimization of these groups by armed, slave raiders. Thus, the native slave trade led to a dramatic increase in native warfare in the region.

The increased presence of disease brought by the European settlers to North America, combined with the establishment of the native slave trade, devastated the Mississippian chiefdoms that had dominated the region prior to the arrival of Europeans. This caused a radical realignment of indigenous peoples in the late 17th and 18th centuries. This realignment created the historic Catawba, Cherokee, Chickasaw, Choctaw, Creek, and Miccosukee Seminole societies.

Throughout North America, the Native American trade eventually forced American Indians into a relationship of dependency on Europeans. This dependency eventually eroded native sovereignty as the colonial period drew to a close. Furthermore, the increased use of alcohol as a trade item by Europeans sped up the process of dependency and the disruption of native societies in the 18th century. Overall, Europeans used native trade to gain control over American Indians. The British, more so than other Europeans, specifically manipulated trade to drive the natives into debt in order to acquire large amounts of land from them during the colonial period.

Native American Warfare

Combat techniques of Native American warriors in the colonial period evolved with in response to influences introduced by Europeans, including firearms technology. In fact, native capacity to adopt and employ European weaponry and adjust to European tactics were highly varied and innovative. Moreover, native warfare with Europeans and adoption of the latter's technology occurred on the basis of native perspectives and perceptions that reflected and affected native approaches to conflict.

The most common fighting tactic used by Native Americans was the so-called skulking way of war, which was marked by a reliance on stealth, surprise, taking advantage of terrain, and individual initiative. Contrary to the contemporary European practice of deploying soldiers in close-order formations firing group volleys under strict command, natives moved, aimed, fired, and used cover individually and rarely engaged in sustained fighting when finding themselves at a disadvantage.

Historians disagree over whether the natives' skulking tactics were in widespread use before contact with Europeans or whether they represented an adaptation to the Europeans' introduction of firearms. Some evidence, including early accounts by Samuel de Champlain of New France and Gov. Cadwallader Colden of New York, indicate that natives may have fought large-scale battles between massed forces in open terrain until the availability of firearms made such tactics too costly. Other accounts, however, demonstrate that at least some native tribes employed skulking methods before European contact because these tactics conformed to the native practice of minimizing casualties in warfare and the desire to obtain captives for adoption into the tribe.

Skulking techniques could not have been used in every form of combat, since natives, particularly the Iroquois, sometimes assaulted the palisaded towns of their enemies, which required the attackers to fire on the fortified town with arrows (and later, muskets), providing

The palisaded Native American village of Pomeioc, North Carolina, as painted by John White in 1585. Palisades were often used for the defense of native settlements. (National Archives)

cover while small assaulting parties hacked their way through the wooden palisade. These tactics also required modification, as the defenders adapted by constructing flanking positions to defend their fortifications against such attacks.

Palisades around settlements were used as a means of defense by many native groups, including the Hurons, the Iroquois, and the Susquehannocks. Such fortifications remained in use until the mid-18th century and provided effective protection against native enemies. However, they proved to be of limited use against European attackers and could even make the occupants of fortified towns more vulnerable to colonial attacks, as shown during the Pequot War (1636–1638) and King Philip's War (1675–1676). In both conflicts, English colonists surrounded and set fire to native forts, trapping the natives inside and slaughtering them when they attempted to escape the flames. Natives thus tried to improve their fortifica-

tions, observing and adopting European defensive techniques such as adding ditches outside the palisade to obstruct an attackers' approach.

Natives faced with the difficulty of attacking colonial forts, garrison houses, and vessels used a variety of innovations to ease their tasks. In August 1675, during King Philip's War, Nipmucks assaulting Brookfield, Massachusetts, constructed siege engines to try to set fire to a fortified garrison house, as did natives who attacked a garrison house in Saco, Maine (then part of Massachusetts), a month later. Abenakis in 1724 and Ottawas and Pottawatomis in 1763 used fire ships in efforts to destroy British and colonial vessels on rivers. The latter incident took place during the siege of Detroit at the height of Pontiac's Rebellion; the native besiegers also constructed field fortifications to protect their positions around Fort Detroit. In June 1763, Senecas who attacked and captured Fort

Presque Isle used approach trenches and tunnels to come safely within attacking distance of their objective.

Skulking tactics, the use and continuing development of fortifications, and the employment of siege engines and fireships demonstrate the wide variety of techniques used in warfare by Native Americans, as well as their ability to adapt and innovate to meet new military challenges. Yet although native tactics are well documented, how they formulated strategy and what those strategies were remain largely unknown.

The lack of information regarding native strategy is the result of the almost complete absence of native sources that could provide insight into their larger military goals and how native leaders planned to achieve them. Nearly all contemporary accounts of native strategy were recorded by Europeans or colonists, whose efforts to explain the rationale and decisions behind native military operations more accurately reflect the views of the writers rather than those of native leaders. All that can be said with certainty is that native leaders often worked to form intertribal alliances to counter the numerical superiority of the colonists, that they often sought (as in the Second Anglo-Powhatan War, King Philip's War, and Pontiac's Rebellion) to launch a coordinated series of surprise attacks to catch their enemies off guard and inflict maximum damage at the least possible cost to themselves, and that their ability to conduct sustained operations was impeded by the need to raise crops, hunt, and otherwise provide subsistence for their people, although if a European ally provided food supplies, native forces could remain in the field longer. The subsistence aspect of native warfare proved to be the natives' greatest vulnerability, and colonists quickly learned that they could force their native enemies to sue for peace by attacking and destroying towns, cornfields, and stored food supplies at less cost in casualties than it would have taken to seek out and engage native warriors in combat.

Another element of native strategy, employed most fully during Pontiac's Rebellion, was to lay siege to posts that could not be carried by assault and then focus on interdicting supplies and reinforcements. Pontiac used this method unsuccessfully during the five-month siege of Detroit in 1763, and his allies used the same strategy in an effort to force the surrender of Fort Pitt. In both cases, however, British relief forces were able to fight their way through to the beleaguered garrisons.

Although native strategy and tactics proved insufficient to protect their territory from the European colonists, native fighting methods did prove remarkable successful. King Philip's War checked the expansion of New England for several decades, the Iroquois managed to maintain their hold on their core territory in New York until the American Revolution, and Pontiac's Rebellion caused the British to halt expansion beyond the Appalachian Ridge. The greatest factors that enabled the colonists to overcome native resistance were not the strategic or tactical failures of the natives but the epidemic diseases that decimated the native population of North America and internecine warfare among native groups that prevented unified opposition to the European newcomers.

Naval Warfare

Naval warfare changed little in the course of the colonial period. With the introduction of cannon aboard ship in the 14th century, larger warships evolved into little more than floating artillery platforms. The introduction of gun ports cut into the sides of the ships led to a change in the way guns were carried in them. The many small, light, man-killer guns above decks gave way to fewer and heavier guns set broadside and fired through the gun ports, with the heaviest guns on the lowest deck.

New England troops under Sir William Pepperell climb aboard one of the warships bound for Louisbourg, Nova Scotia. The expedition captured Louisbourg from the French in 1745. (Library of Congress)

Warship operation was complex and intricate, and success in battle, let alone survival at sea, required crews to engage in a long training period. Although chance always played a role, well-trained crews had a great advantage. This held true both in being able to maneuver the vessel quickly and in producing rapid and well-aimed fire against an opponent.

Individual ship actions were fought as circumstances dictated. With virtually all the heavy guns set along the length of the two sides of the ship and with effective ranges relatively short, most engagements took place at dueling-pistol range, sometimes even gun port to gun port, with the ships grappled together.

If possible, a captain positioned his vessel to enable him to rake his opponent. This meant maneuvering his own ship so that it was broadside to an opponent vessel's bow or stern, enabling him to bring all his own port or starboard broadside guns to bear. The opposing vessel, then, could respond with only its few bow or stern guns. In addition, the bow and stern were much weaker than the ship's sides. This was especially true of the stern, which had at least one row of windows. Raking also meant more opportunity to damage a vessel and inflict personnel casualties because the length of the target vessel was exposed. For all these reasons, raking was the preferred way to engage another vessel.

A well-placed shot, or concentration of shots, could create havoc inside the opposing vessel, dismounting the guns and causing horrible personnel casualties. A chance shot also could damage the base of a mast. Aiming high was another useful tactic. Here a lucky shot could bring down a mast, yards, and sail, obscuring vision and disabling a vessel, at which point it could be raked.

If two ships grappled, one crew might try to board and take the other ship by storm. Edged weapons, such as swords, cutlasses, and poleaxes, as well as pistols then came into play. Well above the fray, marine sharpshooters, placed in the fighting tops, endeavored to pick off exposed members of the opposing crew, especially the officers.

Naval engagements could be exceedingly bloody, as loose cannonballs and showers of wooden splinters produced frightful wounds. Indeed, traditionally, gun carriages aboard ship were painted a blood-red color so as to partially mask the effects of battle. Generally, when captains surrendered, it was because of heavy crew casualties.

Ships were seldom sunk in actual battle, unless it was by fire or the chance explosion of a magazine. Stoutly constructed ships of the line in particular could absorb tremendous punishment. On March 30, 1800, the British 80-gun *Foudroyant* fired 200 12-pounder, 100 18-pounder, 1,240 24-pounder, and 1,200 32-pounder shot—2,740

shot in all—at close range at the 80-gun French warship *Guillaume Tell* before the latter surrendered, or "struck" (and two other British ships were also firing at the French ship at the same time). The *Guillaume Tell* not only survived but was soon incorporated into the Royal Navy.

At the beginning of a war, when a nation had to take its warships out of ordinary (reserve) and new ships had to be constructed, many seamen and officers were untrained. Admirals thus found it impossible to carry out complicated squadron and fleet maneuvers. It was only toward the end of a conflict, when experience among crews was high, that this could be accomplished.

Squadron and fleet tactics were notoriously difficult to execute properly, and admirals faced a considerable challenge in carrying out the highly standardized squadron tactics laid down in fighting instructions that had changed little over the centuries. Sailing vessels relied on the wind for their motive power. Even if the wind as blowing, and often it was not, at no time could the admiral make use of more than five-eighths of the sea because his vessels could not sail directly into the wind. Progress into the wind could be made only by tacking across from one side to the other, and never closer than six points of the compass.

In squadron and fleet engagements, frigates scouted ahead to locate the enemy. A chief failing of admirals in this period was in not maintaining adequate reconnaissance to provide warning of the approach of an opposing fleet. Once enemy vessels were located, the frigates signaled with flags, often in relay over the horizon. When two opposing fleets came within direct sight of each other, one was usually to windward and thus held what was termed the weather gage. This was a considerable advantage in that it allowed that side to choose whether, when, and how to attack. Thus both sides usually tried to secure the weather gage, although on occasion French commanders sought the lee gage to be able to escape if necessary. All this was complicated by the fact that wind and weather were subject to frequent, sometimes dramatic change, and if the fleets were near land the admiral had to take into consideration tides and currents. If the wind dropped altogether, the two sides were left immobile and unable to change position or close, let alone form in battle order. And if the warships on one side failed to maintain position, it could lead to defeat.

Fighting instructions specified linear tactics. These brought the greatest number of guns to bear and had the advantage of being prearranged and easy to enforce. Battles were tightly choreographed according to near-rigid rules. Admiral Sir John Byng, loser of the May 20, 1756, Battle of Minorca, was court-martialed *pour encourager les autres*, or as Byng put it, "They make a precedent of me such as admirals hereafter may feel the effects of." But the excuse for his conviction and execution was not that he had lost the battle. Byng was acquitted of disaffection and cowardice. Instead, he was found guilty of "neglect of duty in battle," that is, violation of the fighting instructions.

In a major action, two opposing fleets arrayed themselves similarly in three divisions: van, center, and rear. Communication by

signal flag, however, meant that captains along the line were unable to see a flag hoisted in the center and so signaling was sequential rather than immediate. The larger the fleet, the more difficult it was to control and the longer it took to maneuver it into position. Tacking into the wind and wearing or gybing (changing course with the wind astern) were difficult maneuvers and taxing for officers and crews. Each ship hoisted the flag shown by the ship ahead. Captains had to be able to hold their precise place in the battle line for their ship on the course set by the admiral and at a set distance from the ship in front. Keeping exact station in the battle line was essential, and in close order, collisions were a constant danger. As a consequence, night engagements were rare.

With each ship following the other and turning at the same place as its predecessor, the vans engaged before the centers, and the centers engaged before the rears. This enabled a fleet downwind, if hard pressed, to break off the engagement. The result was a slow-to-develop battle with each ship following the one ahead of it in two long, stately lines.

When one fleet attacked another already in line, the customary procedure was to make a slow and deliberate approach, maintaining alignment. This might mean an advance speed, even with a stiff breeze, of as little as four knots. Hours and even days might be spent getting in position, or trying to do so.

In 1697, Father Paul Hoste, a Jesuit who had been French vice admiral Anne-Hilarion de Contentin, Comte de Tourville's, chaplain, published *L'Art des armées navales*. The first great study of naval tactics under sail, it laid out three possibilities for fleet battles. The first of these was "massing," in which the attacker concentrated the bulk of his ships against a segment of the enemy line. This was accomplished by reducing the interval between the ships in order to achieve a decisive mastery at one particular point in the line. The remainder of the ships either ahead or astern would be stretched thin in an effort to contain the remainder of the enemy line.

The second major tactic was "doubling," whereby the attacker passed ships, moving in the same direction, on both sides of one end of an enemy line in order to take the enemy vessels under fire from both sides concurrently. This would force the enemy crews to work both the port and starboard batteries at once. Tourville had doubled the allied van in the 1690 Battle of Beachy Head. Doubling presumed a larger attacking force, however.

The third tactic was "breaking," in which case the attacking fleet might be in line-ahead formation coming from the enemy rear. Sailing parallel, it would then force its way through the enemy line at some point, doubling the enemy line by passing back on its opposite side and forcing the enemy crews to fight both sides of their vessels simultaneously.

As the opposing fleets closed, crews were called to battle stations and ran out the guns. When the ships were in position, the two opposing fleets blasted away at each other until individual vessels sustained sufficient casualties or, less likely, were damaged, usually in their rigging, to the point that their captains struck. Captured

ships were usually taken into the victor's navy. Such tactics remained essentially unchanged until the end of the 18th century.

Navigation Acts

Event Date: 1651 onward

Series of restrictions, duties, and taxes enacted by the English Parliament and designed to regulate trade and raise revenue. English navigation and trade regulations were rooted in the economic doctrine of mercantilism, the objective of which was the creation of a self-sufficient imperial structure that ultimately kept control of gold and silver reserves, protected English industries and jobs from foreign competition, and protected the flow of colonial raw materials. Ultimately, this reduced production costs. Mercantilism placed the good of the British Empire above colonial interests.

Parliament passed the initial Navigation Act in 1651 in response to growing Dutch trade with English North America. The act sparked the First Anglo-Dutch War (1652–1654). Parliament's legislation forbade foreign ships from trading with the colonies and required that goods destined for England, Ireland, and the colonies be shipped only on English ships, which were defined as having an English captain and a majority of English sailors in the crew. Foreigners were prohibited from importing fish in the coastal trade in England. These rules, however, were difficult to enforce, as Parliament relied on colonial governors, who had little interest in enforcing the laws.

In spite of the lack of cooperation from colonial governors, King Charles II and the Restoration Parliament saw the value in continuing the Navigation Acts. On July 27, 1660, Parliament passed the Restoration version of the Navigation Act. This legislation provided that no goods could be imported to or exported from English colonies on anything except English-built or English-bound ships. For the first time, Parliament created a list of enumerated goods, which had to be unloaded within the realm. At that time, the list included the important colonial commodities of tobacco, sugar, and indigo.

Over the next three decades, Parliament passed three more Navigation Acts. In 1663, Parliament demanded that all imports to English North America be shipped from England in English ships. The 1673 act demanded that duties be paid on enumerated goods that were shipped from one colony to another before crossing the Atlantic to Europe. Most importantly, however, this measure provided for the appointments of customs commissioners to collect the duties on enumerated goods. Finally, in 1696 Parliament under King William III confined all colonial trade to transportation in English ships. It also granted customs officials in the provinces the same power as officials in England, which included the authority of forcible entry. Further, it required bonds to be posted on enumerated goods and voided all colonial-made laws contrary to the Navigation Acts.

By the beginning of the 18th century, the Navigation Acts changed from creating a more integrated imperial system to a more regulatory system over colonial commodities. By 1705, Parliament restricted the production and exportation of wool and expanded the list of enumerated articles to include rice, molasses, and naval items. Over the next 50 years, Parliament continued these policies of protecting English industries from colonial manufacturing while expanding the list of enumerated goods.

In 1721, Parliament added beaver skins, furs, and copper to the list of enumerated goods. In the next decade, London stepped in to regulate the colonial hat industry and protect London felt makers and then to protect British West Indian planters in the production of molasses. These laws, however, proved to be nearly unenforceable. Lack of British enforcement resulted in what historians have called "salutary neglect" in that the colonies enjoyed the benefits of trade within the empire without the restrictions.

In the decades immediately preceding the outbreak of the American Revolutionary War, Parliament regulated the production of iron in the colonies with the Iron Acts of 1750 and 1757. The Sugar Act became the first act passed by Parliament for the purpose of raising revenue for the Crown, and its enforcement signaled an end to what had become known as the period of salutary neglect.

Neolin

Born: Unknown Died: Unknown

Native American prophet. Neolin (meaning "four") was also known as the Delaware Prophet and the Enlightened One. Although the specifics of Neolin's birth and death are unknown, he first attracted the attention of colonists as a young man preaching his beliefs on the Old Northwest frontier in 1762.

Neolin proclaimed his new "nativist" religion from his home in a Delaware village on the Cuyahoga River in present-day Ohio. His new religion exhibited Christian overtones, undoubtedly influenced by contact with Protestant Christian missionaries who lived and preached among the Delawares. Neolin's descriptions of the universe featured a graphic Christian hell, complete with horned devils and pitchforks, and purgatory. But his central teaching held that contact with whites, principally the British, was the cause of the Native Americans' declining fortunes. The only way to achieve salvation was by breaking off relations with Europeans and returning to the ways of their forefathers.

Neolin was especially vehement about prohibitions against alcohol, polygamy, and witchcraft, and he advocated a return to precontact native rituals and beliefs. He prepared religious charts, his "Indian Bible" for his followers, on deerskins, which outlined separate paths for Native Americans and white men to enter heaven.

According to tradition, Neolin received his first vision and instructions in 1760 from the Delaware Great Being, Keesh-she'-lamil'-lang-up, after earlier smallpox epidemics in 1756 and 1758. Neolin informed his listeners that after sitting at the feet of the Great Being, he had been told to return to Earth with the message that the Master of Life was angry with his Native American children because they had adopted white ways. Hence, he had punished them by removing fur-bearing and other animals deep into the forests. Once natives had severed ties with whites, the animals would be restored to them. Neolin preached a nativist return to precontact traditions and a rejection of social, moral, religious, and commercial dependence on Europeans.

Significantly, Neolin allegedly reported that the Master of Life had told him that not all Europeans had to be banished from native communities. The French reportedly would be spared because they did not covet native lands and always gave gifts to their Native American friends. The land-hungry English, meanwhile, would have to go to the place set aside for them by the Master of Life. Some evidence indicates that the Ottawa leader Pontiac altered Neolin's teachings to favor the French while Pontiac organized native tribes to drive the British from native lands; Pontiac hoped that native success would induce the French to return. Other research, however, suggests that Pontiac accurately related Neolin's ideas to tribal audiences. Certainly, Neolin's message reached outside of the Delaware refugee communities of the Ohio Valley and influenced the western nations of the Ottawas, the Potawatomis, the Ojibwas,

and the Wyandots in the 1760s. Pontiac capitalized on Neolin's ideas to assemble his alliance and launch his uprising in 1763.

Uncertainty shrouds Neolin's activities during the years after 1764. There is some indication that, having predicted British defeat, the suppression of Pontiac's Rebellion undermined his influence. There is also evidence that in his last years the prophet took a renewed interest in conventional Christianity.

Netherlands

The arrival of the Dutch in North America and the establishment of New Netherland took place in the context of the Netherlands' massive expansion and the creation of an extensive commercial empire between 1588 and 1700. The growth of the Dutch Empire was the direct consequence of new opportunities generated by political, strategic, and economic restructuring that occurred in the years around 1590. Most significant among these changes were the decline of Spanish domination in the Low Countries after years of land and naval warfare and the creation of the Dutch Republic (or United Provinces) following the negotiation of the Union of Utrecht in 1579.

The Dutch Republic took its institutional form between 1572, when it overthrew the Spanish Habsburg monarchy, and 1609. It evolved from the Union of Utrecht, which had envisioned a league of seven sovereign provinces that would give up their rights in a few limited areas—principally defense, taxation for defense, and foreign policy—within a confederation. Originally, the decisions, made through the principal governing body, the States-General, were supposed to be unanimous. In practice, however, unanimity was rare. The States-General took its decisions by majority vote. In addition, the States-General's decisions went beyond the limited spheres provided for in the Union of Utrecht. The provinces of Holland and Zeeland asserted their hegemony over the other provinces. Nevertheless, the structure of the Dutch Republican state fostered a unity between the public and private sectors that would profoundly influence the republic's development and that of its overseas colonies.

The flag of the Dutch East India Company and English explorer Henry Hudson's ship *Half Moon*. Hudson made his third voyage to North America under the auspices of the Dutch East India Company. (Library of Congress)

Many elements combined to make possible a vigorous and enduring extension of Dutch influence in Southeast Asia, Africa, and North America. Notably, this was at a time when the Dutch Republic was still embroiled in an all-out land and sea war with Spain that was to last until the Twelve Year Truce beginning in 1609. This extension included a secure home base with a political system that supported an alliance of the civic and private sectors (and that provided a secure base for long-term investments); political support for commercial activity; favorable conditions for breaking into the intensively competitive European pepper, spice, and sugar markets; detailed knowledge of trade routes and conditions in the producing areas of Southeast Asia; and ample military and naval power. The focus of this expansion and the source of the trade in spices so vital to Dutch commercial primacy were the East Indies, where Dutch influence had been growing since the late 16th century, and increasingly toward the 1630s, the sugar-producing islands of the Caribbean.

The emergence of Dutch dominance in these so-called rich trades from Southeast Asia and the Caribbean was the central factor in the rise of the Dutch Republic and its world commercial empire. The trend became apparent in the early and middle 1590s. The first step in the establishment of the Dutch trade empire was the founding of the Long Distance Company (Compagnie van Verre) in Amsterdam in March 1594 by a group of nine wealthy merchants with close connections to both government and com-

mercial circles. The company gathered initial funding of 290,000 guilders and outfitted a fleet of four ships manned by 249 men and armed with 100 cannon (supplied by Holland along with all of the other necessary military supplies). The states also granted the company an exemption from the generality customs on its imports from the East Indies. The fleet sailed for Asia in April 1595. Three of the ships returned safely in 1597, albeit with only 89 men.

With this expedition, the Dutch established the pattern that would characterize their approach to expansion and colonization over the next 60 years—the use of private trading companies supported by the Dutch Republic through direct means such as the provisioning of military supplies and personnel and indirect subsidies such as tariff exemptions. The Dutch Empire was indeed profit-driven. The unique federal structure of the Dutch state and the powerful influence of civic autonomy within the republic made possible a new type of commercial organization. That organization was a chartered joint-stock, state-supported monopoly. At the time, it was federated into chambers and kept its commercial and capital operations separate while observing general guidelines and policies set by a federal board of directors.

This new type of company came into existence in 1601. The states of Holland and Zeeland negotiated the arrangements with the merchant elite for the new United East India Company (VOC). However, it was the States-General of the Dutch Republic that granted the company its charter. This charter, in turn, granted the company sovereign rights to maintain troops and garrisons overseas, fit out warships, impose governors on Asian populations, and conduct diplomacy with local rulers.

From the outset, the new organization was heavily armed and intent on carving out a dominant position in a commercial empire that stretched from the Cape of Good Hope to the shores of the Philippines and Japan. The anchor of this empire was the East Indies. The Dutch presence in this chain of islands, in turn, rested on a network of settlements built around factories (trading stations) on the various islands that the company established and developed on the various islands. It did so through a combination of negotiations with local rulers and the use of force when talks failed. The principal agent in establishing and administering these settlements was the governor-general, appointed by the company's directors in Amsterdam. The governor-general's authority rested mainly on the support of his council, known as the Raad, which was comprised of his principal military, naval, and commercial subordinates. Although there were frequent clashes between the governor-general and the Raad, the system of collective responsibility worked well.

A succession of strong governors-general with support from the Raad expanded and consolidated Dutch dominance in the East Indies. In 1619, the Dutch seized Jakarta on the island of Java and transferred the company's headquarters there. Renamed Batavia, it developed into the largest European military, naval, and commercial establishment in East Asia and would remain so until the close of the 18th century.

By comparison with the Dutch factories and bases in Asia, Dutch settlements in West Africa and America in the early decades of the 17th century were modest. Although they were gradually supplanting the Portuguese and Spanish, the private Dutch companies trading in gold, ivory, salt, sugar, and other goods between Africa and the Americas increasingly felt the need for a state-supported joint stock monopoly modeled on the United East Asia Company to manage Atlantic commerce. The directors of these companies pointed to the opportunities to break into the eroding Spanish and Portuguese influence in the Caribbean and South America to bolster their recommendations.

Reluctance by the States-General to antagonize Spain in the wake of the 1609 truce delayed approval of the Dutch West India Company's charter until 1621. The company's initial endeavors to establish settlements in the Spanish and Portuguese colonies failed. It was not until the capture of Recife in northern Brazil in 1630 and the seizure of Curaçao in the Caribbean in 1634 that the Dutch established a permanent base in Ibero-America. Until the mid-1630s, the West India Company's revenues from privateering against Spanish and Portuguese shipping, the West African gold and ivory trade, and the fur trade in New Netherland were not enough to finance its substantial war fleet and organization. Up until then, it had to depend on States-General subsidies and assistance more than its eastern counterpart. Even after it began to show a profit, it was never as strong as the East India Company.

Around 1640, the Dutch appeared on the verge of establishing a vast and profitable colonial empire in the Western as well as the Eastern Hemisphere. Control of Netherlands Brazil (or New Holland) covered most of northwestern Brazil with a major base at Recife and gave the Dutch almost complete control of the European sugar market. The West India Company also dominated the Atlantic slave trade and was the dominant European presence in West Africa. Finally, the North American Dutch colony of New Netherland, based at the growing port of New Amsterdam and at Fort Orange farther up the Hudson River, provided the base from which the West India Company controlled the North American fur trade.

But this vast transatlantic empire was to disappear within 25 years. The West India Company soon found itself badly over-extended. Continuing tensions in Europe between the Dutch Republic and the European powers, constant warfare with Spain and Portugal, as well as deteriorating relations with England (which would culminate in the Anglo-Dutch Wars of 1652–1654, 1664–1667, and 1672–1674) forced the States-General to keep ground and naval forces closer to home. Furthermore, overbearing and incompetent company officials in New Holland and New Netherland fostered popular discontent. As well, wars with Native Americans endangered the colonies. In 1645, Catholic Portuguese sugar growers, resentful of Protestant Dutch rule and of Dutch favoritism toward Dutch-controlled plantations, revolted and forced the Dutch back into enclaves at Recife and other coastal cities. An expeditionary force of 6,000 Dutch troops dispatched from the Netherlands

in 1648 could not defeat the Portuguese rebels. As a result, the West India Company lost support for its Brazilian colony at home. The Dutch withdrew from Brazil in 1654. Likewise, a continuing series of wars with natives around their New Amsterdam base badly weakened New Netherland. Furthermore, the colony's population and economic growth could not keep up with that of the neighboring English colonies. Because of that, the West India Company did not have the resources to prevent the seizure of New Amsterdam by the English in 1664.

These reverses forced the West India Company and the States-General to scale back their aspirations in the Americas. The Dutch retained their bases in Curaçao in the Caribbean and their forts along the West African coast. This enabled them to maintain their position as a major participant in the Atlantic trade routes. Furthermore, the VOC continued to expand the Dutch commercial, military, and political presence in East Asia. During the mid-17th century, the VOC's naval and military forces virtually eliminated the Portuguese presence in India, Ceylon, and the East Indies. From 1660 until the 1720s, the Netherlands would remain the leading European power in Asia.

Thus, despite the loss of major colonies in the Western Hemisphere, the Dutch colonial empire reached its zenith between 1650 and 1725. During this period, Dutch commerce and shipping expanded in both Asia and the Americas. Under the leadership of the VOC, Dutch political and economic power grew for the rest of the 17th century. Indeed, the alliance between the public and private sectors that dominated the political, social, and economic life of the Dutch Republic served the Dutch well in the development of their commercial empire.

New England Confederation

Start Date: September 7, 1643

End Date: 1691

Union of four New England colonies first chartered on September 7, 1643, that lasted, despite several periods of stagnation, until 1691. The New England Confederation, or the United Colonies of New England, was a union of the colonies of Connecticut (Hartford), Massachusetts Bay (Boston), Plymouth, and New Haven. This marked the first attempt at a European-style federation in North America.

Colonial officials founded the confederation chiefly to provide protection from the threat presented by Native Americans and other European colonizing powers. It was also intended to mediate boundary disputes between the confederated colonies. Maine (nominally under Massachusetts' control), New Hampshire, and Rhode Island did not take part in the union.

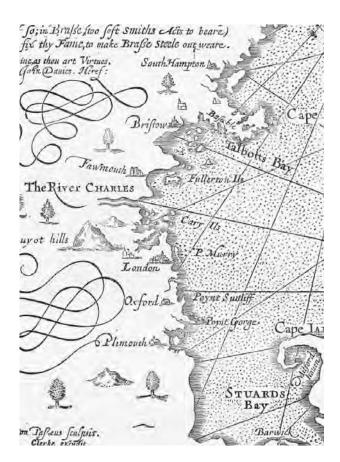

Massachusetts hoped to annex both Maine and New Hampshire, so those two colonies were barred membership because the confederation's charter guaranteed colonial borders. As such, Massachusetts would not be able to take control over them. The confederation refused to allow Rhode Island to join because of its religious tolerance, which was at great odds with Puritan thinking. Leaders of the other colonies hoped to be able to annex Rhode Island.

The articles of confederation contained provisos for joint military actions, defensive steps, and the raising and financing of troops in proportion to the colonies' ability to pay and the number of available men. Each colony selected two commissioners to coordinate the actions of the confederation. These commissioners held both regular and extraordinary meetings. However, the internal affairs of the member colonies were beyond the purview of the alliance.

The New England Confederation had no means to compel members to act. Commissioners simply had the power to ask for cooperation among members. The confederation's primary role was to deal with local Native Americans. That included mediating disputes between tribes or keeping peace between colonists and the natives.

The confederation was born out of several concerns, chief among them the Pequot War (1636–1638). In that conflict, New England colonists and their Native American allies vanquished the hated Pequots. Following the war, colonists and natives streamed into the vacated Pequot lands. In order to ensure an orderly settlement of Pequot territory, the interested parties entered into the 1638 Treaty of Hartford. Additionally, unrest caused by the English Civil War (1640–1660) had created concerns.

Religion was a strong motivation behind the New England Confederation. The four colonies that made up the union were all stoutly Puritan. The Puritans saw themselves as God's agents in the New World, in direct competition with the "forces of darkness" for control of New England. Accordingly, the colonists saw the need to band

Seventeenth-century map of New England. (William Stevens Perry. *The History of the American Episcopal Church, 1587–1883.* Boston: James R. Osgood & Company, 1885.)

together for protection from the heathen natives, the Catholic French, the overly secular Dutch, and the heterodoxy of Rhode Island.

From 1643 to 1652, the confederation indeed preserved peace in the area. In 1653, however, tensions between the Dutch and the New England colonies reached a climax during the First Anglo-Dutch War (1652–1654). When Massachusetts Bay refused to join the other colonies in a proposed offensive against the Dutch, the confederation all but collapsed. The union, though still in existence after the Anglo-Dutch crisis, ceased to be a legitimate political entity for a number of years. Nevertheless, the threat from Native Americans continued unabated.

The confederation was revived in 1672, now including the colonies of Plymouth, Massachusetts Bay, and Connecticut. New Haven Colony had been annexed by the larger Connecticut Colony in 1655. This new New England Confederation's primary goal was to provide protection from restive Native Americans. Tensions between Native Americans and the colonists erupted into the bloody King Philip's War (1675–1676), a conflict that forever destroyed Native American power in New England. The New England Confederation witnessed a brief resurgence between 1689 and 1691. The union helped deal with an Abenaki uprising in northern New England and assisted in negotiations for a friendship treaty

with the Mohawks. The confederation dissolved for good in 1691, when Massachusetts lost its charter and became a Crown colony.

Newfoundland

Island located off the coast of modern-day Quebec, north of the Canadian Maritimes, encompassing 152,734 square miles. As early as the 1480s, European vessels fishing for cod on the Grand Banks may have begun visiting Newfoundland. By the early 1500s, the spring voyage to the Grand Banks became an annual event for English, French, Spanish, and Portuguese fishermen. These fishermen treated Newfoundland's coast as neutral ground for common use by all. They established stations onshore to process the catch and worked out a system for allocating space.

In August 1583, Sir Humphrey Gilbert formally claimed Newfoundland for England. Newfoundland's first English colonists arrived in August 1610 but were unprepared for the long, harsh winter and short growing season. The settlement's population peaked at 100 people, then rapidly declined because of scurvy and hunger. George Calvert, First Lord Baltimore, founded a settlement in 1621 on the peninsula he named Avalon. Calvert himself arrived to govern his colony in 1628. Attacks by French pirates and a cruel winter convinced Calvert to desert Avalon for Chesapeake Bay, however. Thereafter, the English made no other organized attempts to establish colonies on Newfoundland.

Among the English, an informal government exercised what authority existed on the island. A so-called fishing admiral—the commander of the first fishing vessel to arrive each spring—administered justice in season. Year-round settlers were left to their own devices in winter. On the French side, a governor presided at Placentia, on the Avalon Peninsula, beginning about 1660. By the beginning of King William's War (1689–1697), about 1,000 French settlers and more than 1,600 English and Irish lived on Newfoundland.

During the Second Anglo-Dutch War, in June 1665, a Dutch fleet pillaged several English settlements and fishing vessels. Their depredations made the settlers' already precarious existence virtu-

Woodcut map of Newfoundland, 1609. (North Wind Picture Archives)

ally untenable. Simultaneously, the growing French presence further alarmed the English settlers, who then pleaded for a government presence and fortifications. Nevertheless, London officially frowned on permanent settlement of Newfoundland and offered no protection. During the Third Anglo-Dutch War (1672–1674), the Dutch again looted English settlements.

The first few years of King William's War saw a series of French and English raids on the Newfoundland settlements of the other. France then sent Pierre Le Moyne d'Iberville with orders to destroy all English settlements on Newfoundland. His French and Native American force mounted a winter campaign and marched overland to capture St. John's in November 1696. They burned much of the town and some 80 fishing boats, killed nearly 100 people, and sent nearly 500 captives to Europe. D'Iberville then swept through the English settlements, burning and pillaging. The so-called Winter War did not end until spring brought the threat of English warships. An English fleet arrived, too late, in June 1697, and deposited a small garrison to build fortifications at St. John's. At war's end, most of the captured settlers returned and rebuilt their homes. The English and Irish population grew to nearly 3,000 people.

From the beginning of Queen Anne's War (1702–1713), the French raided English Newfoundland by sea and overland. In 1703 and on several other occasions, British ships assembled offshore to move against the French but repeatedly shrank from carrying out the missions. In early 1705, the French launched an overland winter

campaign as brutal and as devastating as that of 1696–1697. Unanswered by the Royal Navy, the French again laid waste to St. John's in 1709. In 1713, however, under the terms of the Treaty of Utrecht, France ceded Newfoundland to Great Britain, although France retained the valuable seasonal right to fish the waters and use portions of the shore.

Now master of Newfoundland, London placed a small garrison at Placentia and continued in its refusal to send a resident governor. Instead, politicians weighed wholesale deportation of Newfoundland's settlers to Nova Scotia. Finally in 1729, King George II appointed Captain Henry Osborne governor. Osborne in turn established a system of off-season, winter government.

During the 18th century, salmon fishing and seal hunting drew British settlers northward and into conflict with the native peoples. A growing Irish population outnumbered the English by midcentury. Recruited as servants, most were locked in mutual loathing with their English masters.

Britain fortified Newfoundland during King George's War, but no attacks occurred there. However, near the end of the French and Indian War in May 1762, a French fleet landed French and Irish infantry on Newfoundland. The soldiers, assisted by Irish servants who turned on their masters, pillaged a number of coastal communities. A British force arrived in September and ejected the French. As provided by the 1763 Treaty of Paris, France retained access to the fisheries off Newfoundland along with possession of the two offshore islands of Saint-Pierre and Miquelon.

New France

Nouvelle France, or New France, was the North American territory claimed and colonized by France from an initial tentative exploration in 1524 to its ultimate cession to Great Britain in 1763. At its peak in the early 18th century, this territory extended from Newfoundland to Lake Superior and from Hudson Bay to the Gulf of Mexico along the Mississippi River Valley. Commerce and religion

drove French colonial expansion and settlement, but the emerging societies felt the defining impact of the military establishment. War was the norm in New France. In some respects, it became the colony's primary industry.

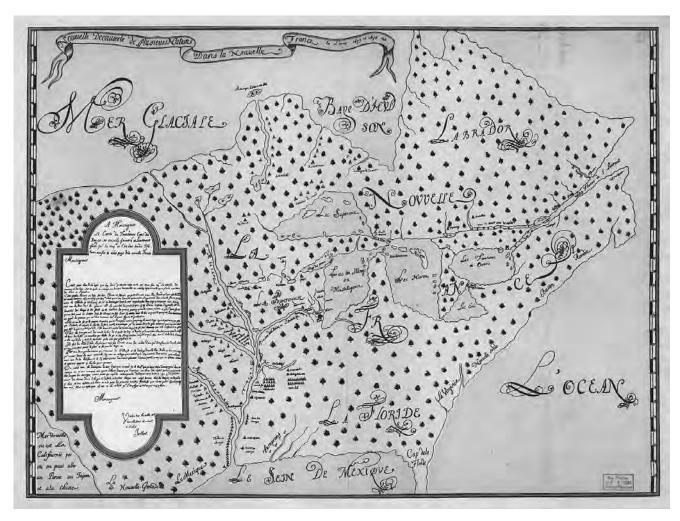

The French colonization of North America began in earnest during the first decade of the 17th century. As early as 1524, France claimed a vast territory under the names of Francesca and Nova Gallia. Attempts to establish a permanent settlement failed, however, and fishing fleets ensured only a seasonal presence along the Atlantic shoreline. Around the turn of the century, the Crown enlisted private money and energy to exploit the increasingly lucrative fur trade, farming out the responsibility for commerce and colonization to chartered companies and merchant associations. Entrepreneurs soon established permanent trading posts, the most important of which were Port Royal (1604) in Acadia and Quebec (1608) in Canada.

Initially, there was little incentive to expand, as American Indians brought their pelts to these stations. Yet the depletion of game, the hostility of the Iroquois toward France's Huron and Algonquin trading partners, and increasing commercial competition from other colonial powers soon compelled the French to push up the St. Lawrence River. They set up posts at Trois-Rivières (1634) and Montreal (1642). The Roman Catholic Church established itself in the colony and provided an additional impetus to the colonial effort. In Canada, an agricultural support base took on importance as peasants, known as *habitants*, settled the countryside to work lands granted to French notables under the seigneurial system.

In 1663, King Louis XIV and his chief minister, Jean-Baptiste Colbert, took over colonial administration from the Compagnie des Cent-Associés, which had overseen it since 1627. The king and his minister thereby established direct royal control over New France and proceeded to reorganize its government, giving it an essentially military framework that would be maintained for a century. Though the king had ultimate authority in colonial matters, the minister of marine and his staff at Versailles were responsible for all but the most important affairs.

In the colony, authority was shared between two officeholders, who followed and informed the content of royal decrees and ministerial instructions. As the representative of the king, the governorgeneral was the highest ranking official in New France. A career military officer, he was mainly responsible for colonial defense and diplomacy. The intendant oversaw justice, interior administration, and finances. As such, he supervised military expenditures. Both officials were based at Ouebec.

New France was subdivided into a number of distinct administrative units, or *gouvernements particuliers*. In the 17th century, these were Quebec, Trois-Rivières, Montreal (the three of which comprised Canada), Acadia, and Placentia. In the 18th century, Louisiana was founded, and Île Royale was established to compensate for the loss of Acadia and Placentia to the British. With the notable exception of Louisiana between 1712 and 1731, when it was controlled by three successive companies, all of French North Amer-

Map by Louis Jolliet showing the territories of New France in the 1670s. (Library of Congress)

ica came under the formal civil jurisdiction of the governor-general and the ecclesiastical jurisdiction of the bishop of Quebec. In practice, however, the distances involved meant that the administrators of Île Royale and Louisiana corresponded directly with Versailles. As a result, they generally acted independently of the governor-general's and bishop's authority.

Within the vast territory claimed as New France, French colonists always remained a minority. Native American societies constituted a dynamic majority on which they had to rely and with which they had to contend. From the very beginning, the nature of the fur trade along the St. Lawrence and Great Lakes axis dictated a lasting commercial partnership with the Algonquins and the Hurons. This in turn led to a century-long confrontation with the Iroquois. Furthermore, beyond economic and strategic considerations, religious conversion was a chief aim of France in America.

The missionary ventures of the Jesuits, and to a lesser extent of the Recollets, strengthened relations between natives and newcomers but brought disappointments as well. After the Iroquois destroyed Huronia in 1649, the fur trade was devastated and the colony lay exposed to renewed attacks.

Settlers became fighters during this early period, as chartered companies that sought to minimize overhead costs provided few soldiers. In 1665, within two years of the royal takeover, the Régiment de Carignan-Salières was dispatched to Canada. The impact of this on colonial society was considerable. The Iroquois finally sued for peace. Moreover, the funds put aside by the Crown for the subsistence of the troops, and the settlement of some 450 men and officers, brought a degree of economic and demographic prosperity.

Following the regiment's disbandment, and according to a royal request, the colonists formed a militia. Unlike similar organizations eventually established in Acadia, Île Royale, and Louisiana, the Canadian militia grew into a significant social and military institution. Yet although it became the primary military force of the colony numerically, its effectiveness should not be overemphasized. In fact, arms shortages and agricultural needs meant that only a fraction of the male population could ever be mobilized. Unlike his counterpart of the previous century, the average *habitant* of the 18th century rarely became a seasoned veteran of woodlands warfare.

Beginning in 1683, the burden of colonial defense shifted from the colonists to colonial regulars, the troupes de la marine. The

military establishment continued to grow as the Crown placed permanent garrisons throughout urban centers and key outposts of New France. Soldiers were recruited in France for service overseas. Few men born in the colonies ever enlisted among the rank and file. Yet in the 18th century, members of the Canadian commercial and seigneurial gentry increasingly dominated the commissioned ranks of the troupes de la marine. In a society that clung to aristocratic pretensions and to the military ethos, the profession of arms provided the nascent local elite a way of climbing the social ladder. This was not the case, however, in Louisiana and Île Royale, where troops continued to be officered by metropolitans who promptly returned to France on the completion of their terms of service.

The economic, political, and military sphere of influence of New France expanded dramatically during the last third of the 17th century. In 1662, the French established a permanent colony at the fishing base of Placentia, Newfoundland. A decade later, Denys de Saint-Simon and the Jesuit missionary Charles Albanel reached Hudson Bay. Louis Jolliet and the Jesuit priest Jacques Marquette extended French influence to the Mississippi River in 1674.

René-Robert Cavelier, Sieur de La Salle, pursued their exploration southward to the Gulf of Mexico. Claiming the entire Mississippi basin for France in 1682, La Salle named it Louisiana in honor of the king. Although the official policy was to restrict settlement to a compact colony along the shores of the St. Lawrence, illicit and licensed fur traders, the former known as *coureurs de bois*, followed suit.

A drawback of colonial expansion became apparent when, by the end of the 17th century, there was a glut in the market for beaver pelts. Despite a gradual recovery, and though the exploitation of wheat and lumber gained some importance, the strategic significance of New France began to outweigh its economic value. The colony became, in the eyes of the Crown and colonial administrators, a strategic barrier to British imperialism. In lower Louisiana, colonial authorities established forts and settlements, including New Orleans (1718), to guard the mouth of the Mississippi River and to provide flank protection to France's island colonies in the Caribbean. Slowly the colony developed a plantation economy similar to that existing in the islands.

The loss of Acadia and Placentia to the British in 1713 similarly prompted the establishment of the colony of Île Royale, comprising current-day Cape Breton and Prince Edward Island, to guard the mouth of the St. Lawrence. The town of Louisbourg (1713) quickly became an imposing fortified naval base, commercial depot, and fishing center.

In the interior of the continent, the French established a vast network of forts that fulfilled military, diplomatic, and commercial roles to sustain native alliances and to contain the British colonies. The hinterland became a middle ground, as natives and newcomers established relations on the basis of mutual dependency and cultural innovation. The Crown adopted a policy of grand alliance, negotiating the Great Peace of Montreal in 1701 with the representatives of 39 nations from the Great Lakes area, including those of the Iroquois Confederacy. A lasting, if tenuous, peace was thus achieved, and

France gained considerable credit among its indigenous allies by posing as its architect and guarantor. When nations such as the Fox, the Natchez, and the Chickasaws blatantly resisted French influence, however, the Crown's policy of accommodation and appearant turned into one of military annihilation.

France spent considerable sums of money on the distribution of presents to friendly Native American nations. The Crown increasingly subsidized the fur trade directly and indirectly to prevent commercial partners from turning to the British. The trade conducted in hinterland forts was farmed out to the commanding officers of the troupes de la marine, who combined their personal pecuniary interests with the political aims of the Crown. Some natives settled around these forts. Others were attracted to the colonial heartland, settling for a variety of personal, economic, and political reasons on missionary-administered *réductions* (now reserves) in the St. Lawrence River Valley. In wartime, France could depend on the military aid or benevolent neutrality of a great many native warriors. In light of the growing threat posed by Great Britain, it increasingly found this an absolute necessity.

Demographically, New France lagged behind its colonial rivals. By the mid-18th century, it numbered an estimated 70,000 colonists, most of whom were concentrated along the Quebec-Montreal axis. This amounted to less than 10 percent of the population in English North America.

In times of uneasy truce there existed a sort of colonial symbiosis, for commerce (generally illicit) was conducted between Acadia and New England by sea and between Canada and New York along the Richelieu River and the Hudson River. Yet economic, political, and military competition often led to open conflict. As early as 1613, and again in 1629, English adventurers had sacked Port Royal. The latter year, Quebec too became a target.

Toward the end of the 17th century, the conflict intensified. The first true intercolonial war, King William's War (1689–1697), was followed by Queen Anne's War (1702–1713). During these conflicts, as during King George's War (1744–1748), colonial authorities adopted an aggressive defense. They directed raids against frontier towns, trading posts, and fishing stations. Native allies played a prominent role in this *petite guerre*, and militiamen and colonial regulars in turn quickly adopted their guerrilla tactics. In the short term, the defense of New France proved broadly successful. Although Port Royal fell in 1690 and 1710, and Louisbourg in 1745, and Britain took possession of Newfoundland and Acadia, neither Canada nor Louisiana suffered any serious losses.

The Crown came to view New France as a small garrison that could tie down a much larger enemy force, preventing it from interfering with more important operations in Europe. This was never more true than during the French and Indian War (1754–1763). Great Britain was compelled to commit one-seventh of its army, some 20,000 men, along with thousands of provincial troops of the British North American colonies, to face a few thousand French colonial and metropolitan regulars supported by militiamen and native allies. French strategists combined guerrilla warfare with

traditional European campaign tactics, which yielded initial successes. Nevertheless, the French effort eventually collapsed in the face of overwhelming British naval and ground forces.

In September 1760, the governor-general of Canada capitulated. Three years later, the Treaty of Paris confirmed the cession of French North America to Great Britain, save for Louisiana, which had secretly been transferred to Spain. New France ceased to exist. This important shift, however, should not mask profound historical continuities. Although there were tragic stories such as those of the Acadians forcibly deported in 1755, the regime change made little immediate difference in the lives of the bulk of the French-speaking population that remained in Canada and Louisiana. They retained their language and many of their institutions. The military establishment, now maintained by Britain and Spain, continued for some time to play a fundamental role in the economy and society of France's former colonies.

New Hampshire

British colony that separated major English settlements in Massachusetts from French Canada and its Native American allies. As with all the New England colonies, the province of New Hampshire witnessed a series of American Indian raids throughout its early history, particularly after the Anglo-French wars erupted on the North American continent in the late 17th century. During that period, the French actively encouraged their Native American allies to attack English settlements.

Eighteenth-century view of Portsmouth, New Hampshire, from the Piscataqua River. New Hampshire was founded in 1623 with the establishment of English settlements along the Piscataqua River. (Library of Congress)

New Hampshire was founded in 1623 with the establishment of English settlements along the Piscataqua River. The English quickly spread westward, establishing four major towns—Dover, Portsmouth, Exeter, and Hampton—in quick succession. By 1640, just over 1,000 colonists lived in the region, amid roughly 4,000 Native Americans. For much of this early period, the settlers and natives lived at peace with one another. This détente was accomplished mostly through the force of personality of the dominant Native American chief, Passaconaway of the Penacooks, the largest of the 12 tribes in New Hampshire. Although suspicious of English settlers, Passaconaway maintained correct relations with the colonists through much of the mid-17th century.

By the outbreak of King Philip's War in 1675, however, Passaconaway had been succeeded by native leaders less tolerant of spreading English settlements. Two of the three biggest tribes in New Hampshire—the Ossipees and the Pequawketts—answered King Philip's call for a full-scale native uprising and began conducting raids on settlements all over the colony. Between September and November 1675, roughly 50 English and 90 Native Americans died in the fighting. In December, the tribes successfully negotiated a peace with Major Richard Waldron of the New Hampshire Militia.

When King Philip's uprising collapsed in Massachusetts and Rhode Island, many of his supporters fled to New Hampshire, hoping to hide among the area's native population. In August 1676, however, two Massachusetts Militia captains went to a Native American gathering sponsored by Waldron to seek out the fugitives. Those they recognized were sent to Boston, where they were either executed or sold into slavery. The New Hampshire natives never forgave

Waldron for his part in the proceeding. Anglo-American Indian relations remained tense over the next several decades.

Open warfare did not erupt between the two groups until the outbreak of King William's War in 1689, however. For years, the French had been expanding their exploration of the North American continent, carefully cultivating Native American alliances. Among the New Hampshire natives, a French emissary named Baron de Castine encouraged the anti-English sentiment that was already strong among them. He even convinced the Penacooks to join with other tribes in taking up arms against the English. When war began between England and France in 1689, these longstanding tensions led to a series of native raids and English counterraids.

Most of the English settlements in New Hampshire suffered from Native American attacks, and both Dover and Durham were burned. In fact, the attack on Dover in 1689 saw the torture and death of Waldron. The decade of the 1690s saw the most intense English-native fighting of New Hampshire's history, with the colony losing roughly one-tenth of its population, some to captivity. Among the most famous captives was Hannah Duston, seized by natives from her home in Massachusetts. While a prisoner, she killed several of her captors and escaped back to Massachusetts.

Subsequent colonial wars saw a continuation of this pattern of hostility between colonists and Native Americans, although the bloodshed never reached the level of that during King William's War. More and more, New Hampshire's commitment to the British war effort consisted of sending men to participate in various expeditions elsewhere in New England or in Canada. This commitment also included manning defensive positions along the Connecticut River, such as the Fort at Number Four, the northernmost British defensive works when it was constructed in 1740.

During King George's War, New Hampshire contributed a contingent of 450 men under the command of Colonel John Goffe to participate in the successful expedition in 1745 against the French stronghold at Louisbourg. Thirty men garrisoned at the Fort at Number Four repulsed an attack by more than 300 French and allied native warriors.

In the French and Indian War, New Hampshire boasted two colonial leaders who gained fame throughout the colonies—Robert Rogers and General John Stark. Both men led New Hampshire militiamen into battle, although none of the fighting occurred within the colony. New Hampshire men took a leading role in the Battle of Lake George in 1755 and by 1759 some 1,000 New Hampshire militiamen were serving outside the province. The province's most important contribution was the group of rangers trained for wilderness warfare by Rogers.

New Jersey

New Jersey passed from Dutch to English control in 1664. It remained under British control thereafter, except for the brief Dutch reconquest of 1673. Under the English, New Jersey came to have 85 proprietors, who tried to collect rent from colonists rather than confer land ownership. In addition, the government was subordinate to the governor of New York. As a result, legal and political contention periodically erupted into civil disorder. This dynamic dominated New Jersey civic life for much of its colonial history. New Jersey remained virtually untouched by warfare until the American Revolution.

In 1624, Captain Cornelis May of the Dutch West India Company established Fort Nassau as a small trading post on the eastern bank of the Delaware River, near present-day Gloucester, New Jersey. For many years the fort lay vacant, with just a single vessel anchored nearby to represent Dutch trading interests. A handful of settlers lived nearby. As the Swedes settled the Delaware Valley, Gov. Petrus Stuyvesant of New Netherland grew dissatisfied with Fort Nassau's location. In 1651, he mounted an expedition of 11 ships and 120 soldiers and transferred Fort Nassau's garrison to Fort Casimer in present-day Delaware.

Dutch settlers returned to New Jersey in 1660 and established the town of Bergen (present-day Jersey City). On the Dutch surrender of New Netherland to the English in 1664, King Charles II gave the territory to his brother James, Duke of York. The duke then transferred ownership of New Jersey to John, Lord Berkeley, and Sir George Carteret. The name "New Jersey" commemorated Carteret's service as governor of the island of Jersey in the English Channel. Carteret sent about 30 colonists to New Jersey under command of his cousin, Captain Philip Carteret.

Except for a few hundred scattered Dutch and Swedish settlers along the Delaware River and the Hudson River, New Jersey in 1664 was Lenni Lenape, or Delaware, country. The Delawares were an Algonquin-speaking people and consisted of several subgroups. The Delaware population was about 8,000 people when the first Europeans arrived, but in a series of epidemics during the 1600s the

Newly appointed royal governor Philip Carteret arrives at Elizabethtowne, New Jersey, in 1665. (Library of Congress)

Delawares died by the thousands. Hundreds more perished in Kieft's War during the 1640s, and by 1700 only about 3,000 Delawares remained. As the European population grew, the surviving Delaware people moved north and west into neighboring colonies. In 1758, the few hundred Delawares remaining in New Jersey gave up the last of their land. Most moved to a 3,000-acre reservation in the New Jersey Pine Barrens.

From the outset, the New Jersey proprietors tolerated religious diversity. During the first two years of English control, Quakers from Long Island, Puritans from Connecticut, and Baptists from Rhode Island all purchased land and founded towns in New Jersey. Over time, the colony attracted Scottish Presbyterians along with Irish, Dutch, Swedish, French, and German settlers of various Protestant denominations.

New Jersey's division into a multitude of proprietorships began when Lord Berkeley sold his half interest in New Jersey in 1674. Thus, a deed divided the province into East Jersey and West Jersey. Carteret retained ownership of East Jersey, and Berkeley sold West Jersey to two Quakers. They in turn sold much of West Jersey to William Penn and several other Quakers. In 1681, after Carteret's death, Penn's group purchased East Jersey as well. Many of the shareholders then sold off tracts until, by the mid-1680s, New Jersey had 85 proprietors.

Control of the New Jersey government passed from the proprietors to the royal governor of New York, and back again, except for a brief period under the Dominion of New England. In 1702, East and West Jersey were reunited as a royal colony under the governor of New York. The New Jersey Assembly fought the New York governors over almost every issue and kept the government in a state of deadlock. New Jersey received its own governor in 1738. Through it all, the proprietors retained and exercised their

right to charge rent for land, a considerable thorn in the side of the citizenry.

Beginning with the ouster of Carteret in 1672, New Jersey's settlers often broke out into open rebellion over land rents. The assembly refused to pass or enforce laws, and at times mobs attacked judges and broke up court proceedings. Even after New Jersey received its own governor, the colony's government ground to a halt as riots again erupted over old land controversies. Land riots continued to occur periodically for another decade. Residents refused to pay rent on their land. The proprietors then ordered them evicted and jailed, and rioters freed the prisoners, wrecking the jails in the process.

New Jersey faced little danger of attack during the various wars with France. Nevertheless, like all the colonies, it was expected to contribute money, men, and supplies. Despite the governor's requests, the assembly allocated only minimal support. During the French and Indian War (1754–1763), however, attacks by Native Americans along the upper Delaware River—during which about 40 settlers were killed—raised citizens' fears in western New Jersey. Answering their pleas, the assembly sent some 150 militiamen to protect the frontier. About 1,000 New Jersey troops, most notably the "Jersey Blues" regiment, saw action in New York, at Oswego, at Lake George, and at Fort Ticonderoga.

New Mexico

The northern frontier region controlled by New Spain. In the early 16th century, survivors from the 1527 Pánfilo de Narváez expedition to Florida, having been shipwrecked on the coast of present-day Texas, journeyed across northern Mexico in hopes of making their way home. Following his eventual rescue, Alvar Núñez Cabeza de Vaca, the leader of the group, reported rumors of cities to the north that contained an abundance of wealth.

These stories appeared to validate Aztec mythology, so the viceroy of New Spain authorized exploratory expeditions into the northern frontier of Mexico in search of cities of gold and silver. Francisco Vásquez de Coronado, governor of the province of New Galicia in northern Mexico, led the largest of these expeditions from 1540 to 1542. Coronado, with approximately 300 Spanish cavalry and infantry and more than 1,000 Tlaxcalan natives, journeyed up the Rio Grande River Valley into the land of the pueblos only to find none of the anticipated opulent cities. Instead, the Spanish conquistadors discovered desert towns of stone and mud-plastered dwellings containing not riches but stores of maize and beans.

Coronado's accounts of his unprofitable expedition dissuaded further official forays into the northern Mexican frontier for some 50 years. There were, however, occasional unsanctioned ventures northward during this period by Franciscan priests and civilian opportunists. One such expedition was led by Gaspar Castaño de Sosa, who in January 1590 led 170 settlers up the Rio Grande to the Pecos River in hopes of finding productive silver mines. Pursued by the viceregal agent, Captain Juan Morlete, Sosa was arrested and sent back to Mexico in chains.

In 1595, however, the Spanish court commissioned Juan de Oñate, the son of a wealthy silver mine owner, with leading an expedition up the Rio Grande to spread the Catholic faith, pacify the natives, and establish a permanent colony in the northern provinces of New Spain. In 1598, Oñate and 500 men, women, and children entered New Mexico near present-day El Paso, Texas, and claimed possession of the land and its people. Oñate arrived at the confluence of the Chama River and the Rio Grande in July and established his headquarters at Ohke Pueblo, which he renamed San Juan, the capital of the new colony.

From San Juan, Oñate personally conducted a reconnaissance of the province. Native hospitality turned to resistance at Acoma Pueblo in January 1599, leaving 11 Spanish soldiers dead. In retaliation, Oñate sent a punitive expedition against the town, killing 800 men, women, and children and taking another 580 captive. In 1601, Oñate moved the capital across the Rio Grande to Yunque Ouinge

Pueblo and renamed it San Gabriel. Nine years later, the capital moved again, this time to its permanent location in Santa Fe.

Throughout much of the 17th century, New Mexico existed mainly as an outpost on the fringes of the Spanish empire. There was no Spanish military garrison in the colony and the settlers were expected to serve as soldiers if necessary. With only one urban center (Santa Fe) in the province, most of New Mexico's 3,000 colonists lived in scattered settlements near the pueblos along the Rio Grande and profited from the exploitation of native labor. The realization that there were few riches to be found among the pueblos persuaded many colonists to return to Mexico and offered little incentive for new colonists to venture northward. Life challenged those who remained, and support from Mexico was rarely forthcoming. Warding off Apache, Ute, and Navajo raiders proved especially problematic. Church and civil authorities seldom got along, and corruption and abuse of power were commonplace.

The repressive policies of the Spaniards toward the Native Americans, particularly in the realm of religion, reached a boiling point in 1680. Popé, a spiritual leader from San Juan Pueblo, preached the maintenance of traditional religious practices and railed against all things Spanish and Christian. As Popé's message spread throughout the pueblos, Gov. Juan Francisco Treviño ordered the arrest of native spiritual leaders in the province. Because of the loss of their religious leaders, the Rio Grande pueblos threatened to rebel against the Spanish and prompted a worried Treviño to free his captives. On his release, Popé devised plans for a widespread revolt. Popé unified the majority of pueblos in a coordinated uprising against their oppressors in early August 1680.

The success of the Pueblo Revolt kept the upper reaches of the Rio Grande free from Spanish control for 12 years. When the Spanish returned to New Mexico in 1692 under Diego de Vargas, the pueblos responded with minimal resistance. Spanish officials quickly repressed any opposition they did encounter.

Effective Spanish control of the province resumed in 1696 but with a decidedly different approach toward the pueblos. Natives were allowed to retain their religious icons and ceremonies. Labor and food requisitions were moderated. Spanish officials went so far as to arm the pueblos to help them ward off raiding tribes. Throughout the remainder of the colonial period, the pueblos were spared the repressive policies of the pre-1680s as Spain grew more concerned about encroachments along the fringes of its provinces than it was about the conversion of natives to Catholicism.

As French traders along the Gulf of Mexico and the upper reaches of the Mississippi River Valley began seeking trading partners among the inhabitants of New Mexico and Comanche raiding parties began threatening New Mexican settlements, the viceroy of New Spain responded by increasing the Spanish military presence in the province. The construction of presidios at El Paso del Norte in 1681 and at Santa Fe in 1693 were followed by punitive campaigns against nomadic natives and unwanted Frenchmen.

After the War of the Quadruple Alliance (Britain, France, Holland, and Austria against Spain, 1718–1720) erupted in Europe, New Mex-

ican governor Antonio Valverde y Cosío dispatched his lieutenant governor, Lieutenant General Pedro de Villasur, to seize French fur traders who had entered New Mexico illegally and to gather information about French activities along the northern frontier.

Villasur and his force of 45 soldiers, 60 Pueblo Indian allies, some Apache scouts, and Father Juan Minguez marched to the confluence of the Platte River and the Loup River in present-day Nebraska, before Pawnee and Oto warriors (possibly aided by a few French fur traders) attacked them at dawn on August 14, 1720. The lieutenant general, 31 soldiers, Pueblo Indians, and the priest were killed. The defeat, which the survivors blamed on the French fur traders, demoralized Spanish forces in New Mexico and spawned fears of a French invasion.

The conclusion of the French and Indian War (1754–1763), and the subsequent Treaty of Paris in September 1763, removed the French threat from New Spain's frontier only to replace it with worries about roving natives and Anglo-Americans. In 1779, the governor of New Mexico, Juan Bautista de Anza, led 800 soldiers on a punitive expedition against the western Comanches who had been systematically raiding New Mexican settlements for years. Anza decisively defeated the Comanches north of present-day Pueblo, Colorado, and established long-term peaceful relations with their leaders.

With the exception of a brief foray in 1807 by a party of U.S. explorers under Lieutenant Zebulon Pike (who was detained by Spanish officials in Santa Fe), Anglo-American interest in New Mexico did not really materialize until the 1820s with the establishment of the Santa Fe Trail. For the remainder of the colonial period, until Mexican independence in 1821, New Mexico existed as part of the Comandancia General de las Provincias Internas (General Command of Inland Provinces), a semi-autonomous administrative entity designed by the Spanish court to boost morale among the presidios, coordinate military campaigns across the northern frontier, promote immigration, and foster economic development in the region.

New Netherland

New Netherland was the North American portion of the Dutch 17th-century overseas colonial empire. The Dutch presence in North America spanned 55 years. It began with Henry Hudson's discov-

ery of the river that bears his name in 1609 and ended with the English seizure of New Amsterdam in 1664. The commercial elite of the Dutch Republic viewed their North American foothold as a business enterprise rather than as a colonial settlement. This outlook helped to shape the colony's economic, social, political, and military development.

Dutch expansion into North America began at the height of the republic's military and economic power in the first half of the 17th century. Unfortunately, the Dutch sought to expand their global trading empire by violence, triggering a growing rivalry with England and France and spreading themselves perilously thin. The Dutch solved the latter problem by making their overseas holdings as self-sufficient and profitable as possible. The early Dutch settlements on Manhattan Island and elsewhere in the Hudson River Valley were trading posts. Even as the colony gained more settlers, it remained essentially a business enterprise that lacked permanence and social cohesion.

The trading elite who dominated the settlements were often at odds with each other, and although the Dutch extended their toleration of religious and ethnic minorities to their colony, its government was hardly democratic. The Dutch West India Company appointed the colonial governor and an advisory council of leading colonists. It did not, however, permit any elected assembly. The governors tended to be autocratic, arbitrary, and, save for Petrus Stuyvesant, appallingly incompetent.

Dutch relations with Native American tribes were ambivalent at best. Dutch authorities sought good relations with the larger, more powerful tribes because of their political and economic power. But their dealings were heavy-handed with those tribes that were smaller and weaker.

This bullying attitude also extended to their weaker European rivals, the Swedes. In 1655, Stuyvesant seized a string of Swedish forts along the coast of present-day Delaware. He did so without notifying either the company or the home government of his intentions. Such actions did not endear the Dutch to either the other European states or their Native American neighbors. Eventually, greed and arrogance on the part of the Dutch leadership in New Amsterdam led to a series of wars with Native Americans between 1640 and 1664. These conflicts ruined Dutch trading settlements economically and left them vulnerable to seizure by the English.

The profit-driven nature of the Dutch enterprise is reflected in its origins. Hudson, an English entrepreneur and ship captain, made his 1608–1609 voyage to the New World under contract to Dutch merchants. Beginning with Hudson, these merchants annually sent ships across the Atlantic and up the Hudson River to trade with the natives for furs. From the upper reaches of the river, traders could contact distant northern tribes. To use these trade routes, however, the Dutch needed the good will of the powerful Iroquois Confederation.

In 1614, the Dutch established a semipermanent presence on the upper Hudson by establishing Fort Nassau (later relocated and renamed Fort Orange, near present-day Albany, New York). Until

The Fall of New Amsterdam, by J. L. G. Ferris, shows Petrus Stuyvesant in 1664, standing among residents of New Amsterdam who are pleading with him not to open fire on British warships in the harbor. (Library of Congress)

the late 1620s, this small outpost contained only about 50 Dutchmen. Most of them were fur traders and soldiers employed by the Dutch West India Company. They remained neutral in the quarrels among the Native American tribes in the area, delivering trade goods (especially muskets, powder, and ammunition) to whichever groups provided the beaver pelts prized in Europe.

The need for good relations with the Iroquois was emphasized in 1626, when the fort's commander, acting against company instructions, sided with the Mahicans in their war against the Mohawks, a member of the Iroquois Confederation. The commander was killed along with three of his men. Unlike the Spanish and French and, to a lesser extent, the New England Puritans, the Dutch made no effort to perform missionary work among the Native Americans. Eschewing such endeavors, New Netherland missed a chance to solidify its ties to the Iroquois through religious conversion.

The directors of the Dutch West India Company recognized the need for immigrants and large settlements to protect their outposts on the Hudson. Without strength in numbers to guard the colony's entrance, the rich Dutch trade in furs flowing from Fort Orange would be vulnerable to seizure by French or English ships. Farms worked by colonists could, moreover, help the colony become self-

sustaining in food by producing grain, meat, and lumber to supply Fort Orange. Home-produced products could also be shipped to the Dutch West Indies to supply the slave-worked sugar plantations that formed the cornerstone of Dutch trade between the New World and Europe. With a large and diverse population in the home country drawn by the Dutch Republic's religious and ethnic tolerance, company promoters had a seemingly ample pool of potential immigrants to North America from which to draw.

In 1625, the Dutch founded New Amsterdam, a fortified town on Manhattan Island at the Hudson's mouth. With one of the finest harbors on the Atlantic Coast, New Amsterdam served as New Netherland's largest town, major seaport, and governmental and company headquarters. The strategic presence of a large, fortified town encouraged the growth of farms and villages not only on Manhattan Island but also on Long Island to the east and in present-day New Jersey to the west.

In spite of the attractions of rich farmland and the fine seaport, however, government and company officials never attracted sufficient settlers to North America to keep up with the growing English population to the east and south. With no religious persecution to endure and enjoying the highest living standard in Europe, most of

the Netherlands' citizens preferred to remain at home or else venture to the richer East Indies. New Netherland thus never was able to develop a strong political community. Instead, it became increasingly divided between the small trading post upriver at Fort Orange and the burgeoning settlements on the lower Hudson River.

The defense of the colony lay with the Dutch West India Company. Unlike the English colonies, Dutch company and government officials in the home country and New Netherland did not rely on local militias. In their haste to induce settlers to immigrate, the Dutch did not bind the new arrivals to any military service obligation. Instead, they promised the immigrants military protection and underwrote the shipping and payment of Dutch soldiers (many of whom had joined the Dutch Army as mercenaries in the first place) to protect the settlement.

In addition, Dutch tolerance of ethnic and religious diversity gave New Netherland a social heterogeneity that undermined the development of a community identity and subverted militia organization. Indeed, Dutch officials vacillated between forming militias and discouraging their growth. They feared that such organizations might turn against the autocratic government in New Amsterdam. This atmosphere of dependence and distrust of their own people forced local authorities to rely on the home country's military and naval resources, the goodwill of the Iroquois, and their ability to hire mercenaries. With only these limited resources, they were unable to match the growing power in the New World of England and France.

The dualism in Dutch relations with the local tribes reflected this growing strategic and political vulnerability. The contrast between the isolated trading posts on the upper Hudson and the growing cosmopolitan settlements on the Atlantic was manifest in behavior toward the natives in the two halves of the colony. Upriver at Fort Orange, the small number of Dutch soldiers and traders were too few and too dependent on the fur trade to threaten the formidable Iroquois Five Nations (particularly the Mohawks). With their reliance on Iroquois goodwill for their survival and prosperity, the Dutch at Fort Orange were as much an asset to the natives as they were to their superiors in New Amsterdam and the home country.

This respect for Iroquois primacy in the upper Hudson contrasted sharply with Dutch treatment of Native Americans living around New Amsterdam. A disunited grouping of Algonquian-speaking bands, these natives contributed little to the fur trade and they had fewer and less-well-armed warriors. Furthermore, the downriver Dutch had come in substantial numbers to develop farms and regarded the Algonquins as competitors for land and food, competition that was best removed as soon as possible.

Dutch arrogance, greed, and brutality toward the lower river natives eventually resulted in war. The Algonquins particularly resented the Europeans' disregard for their agriculture. Colonists' livestock invaded Algonquin cornfields, trampling and eating their produce and provoking the natives to kill the offending animals. Ultimately, the natives killed some of the cattle's owners, in turn outraging the settlers.

Dutch colonists trading with Native Americans in New Netherland. (Library of Congress)

This cycle of Dutch encroachment and native reprisal culminated in 1641. That year, the overbearing Dutch governor, Willem Kieft, offered a bounty for members of the Raritan and Wappinger bands who had killed several Dutch farmers in a livestock dispute. Matters worsened in 1643, when the Mohawks moved downriver to exact tribute from the Wappingers. The Dutch permitted the Mohawks to attack a Wappinger village at Pavonia (near present-day Jersey City) where they killed most of the adult males. When the Mohawks finished, Kieft ordered Dutch soldiers to kill the survivors, many of whom were women and children. This incident, which became known as the "Slaughter of the Innocents," precipitated an all-out war between the Dutch and 11 local Algonquin tribes, who killed large numbers of rural white inhabitants and laid siege to New Amsterdam.

Kieft's War, as the conflict came to be known, proved ruinous to New Netherland. Indeed, it revealed that neither the colony, nor the Dutch West India Company, nor the home government had the resources to impose terms on their Native American adversaries. In the end, company officials hired Captain John Underhill, an English mercenary who had gained a reputation for ruthlessness during the Pequot War. Underhill brought an end to the war by attacking native villages and burning them to the ground. These tactics compelled the natives to divert manpower from besieged New Amsterdam and, ultimately, to agree to peace in 1644.

The Dutch pattern of maintaining friendship with the stronger, richer tribes while bullying those that were weaker and poorer led to other major wars, particularly the Peach War (1655–1657) and a continuing conflict with the Esopus tribe that ran from 1659 to 1664. In these conflicts, New Netherland authorities frequently relied on native allies, such as the Susquehannocks and the Mohawks, who valued their access to Dutch trade and wanted to reduce the territory held by the Esopus. In 1664, Governor Stuyvesant persuaded the Mohawks to mediate an end to the Esopus Wars. The conclusion of this turmoil ended more than 20 years of war between the indigenous peoples and Dutch traders, a conflict that drained the Dutch colony financially.

These native wars, disastrous as they were, weakened the Dutch strategic and political position in the New World vis-à-vis the English and the French. The decline of Dutch power and influence in the New World was accelerated by growing English control of the seas. That dominance enabled them to enforce a series of Navigation Acts that excluded Dutch trade goods from English ports. The Dutch failure to break England's control of the seas in the First Anglo-Dutch War (1652–1654) ultimately had an impact on colonial developments.

The weakness of the Dutch colony came to a head in 1664. That year, England's King Charles II instigated another war by sending an expedition to bring an end to New Netherland, thereby ending Dutch competition in trade but also intimidating the Puritan colonists in New England. Without a declaration of war, the English sent three warships supported by 300 soldiers under the command of Colonel Richard Nichols to seize New Amsterdam. Unaware of any hostile English intent until this force appeared off Manhattan, Dutch officials had no time to rally support in their community. Fearing the destruction of their town, homes, and property and alienated from Stuyvesant's tyrannical rule, the people of New Amsterdam refused to fight. Stuyvesant thus had no choice but to surrender. The English had seized New Amsterdam without firing a shot.

The Second Anglo-Dutch War (1664–1667) ended in the Dutch cession of all of their holdings in North America. In the Third Anglo-Dutch War (1672–1674), the Dutch briefly recaptured New Netherland in 1673, but they surrendered it permanently the following year.

Firmly under English control, New Netherland became New York, named after the Duke of York. New Amsterdam on Manhattan Island became New York City.

New Orleans (Louisiana)

French settlement founded in 1718 by Jean-Baptiste Le Moyne de Bienville on the lower Mississippi River and named Nouvelle Orléans in honor of the French regent, the Duc d'Orléans. The site chosen lay at a relatively high elevation between Lake Pontchartrain to the north and the Mississippi River to the south. A series of forts and trading posts that ran from the interior to New Orleans and Mobile allowed the French to control trade in the lower Mississippi River Valley.

The founding of New Orleans advanced a profitable trade network already in place. However, over time its commercial and strategic importance for the French empire in North America as the outlet to the Mississippi increased. Indeed, control of New Orleans and its approaches via the river and its portages from Lake Pontchartrain and Mobile Bay meant effective French control over the whole of the southern half of the Mississippi River. In 1722, New Orleans replaced Mobile as the capital of the colony of Louisiana.

Louisiana's settlement differed substantially from French Canada. A gender imbalance retarded the development of family farming among French settlers, and the colony failed to develop the sort of military tradition that occurred within Canada. John Law's Company of the Indies, which undertook the development of the interior of the Mississippi Valley, turned to slaves to solve the colony's labor shortages on its sugar plantations. Rather than having an effective militia, the colony depended for its security on French regulars, but also on native allies, particularly the Choctaws, to combat other tribes. In 1729, the Natchez tribe went to war against the French settlers in the area, which led to the development of the first earthwork defenses around New Orleans. The Natchez War would last until 1733. Meanwhile, in 1731, Louisiana became a Crown colony.

In 1736, a war began that pitted the French and their native allies against the Chickasaws. Later, intertribal disputes among the Choctaw would endanger French settlers. Nevertheless, New Orleans was never subject to attack by a European power over the course of the colonial period, although governors certainly feared such an attack in times of war.

View of New Orleans, Louisiana, in 1719. (Corbis)

In 1763, at the end of the French and Indian War (1754–1763), the city of New Orleans was ceded to Spain. In 1766, French settlers within the city rebelled on the arrival of the new Spanish governor, Antonio de Ulloa. The Irish-born Spanish general Alexander O'Reilly arrived in 1769 to govern the territory and with 2,000 troops quickly put down the insurrection and had the leading figures hanged. During the American Revolutionary War, Gov. Bernardo de Gálvez, on learning of the declaration of war between England and Spain, moved with a force from New Orleans in 1779 to take British West Florida, completing the conquest of that province in 1781. In 1788, a massive fire swept through the city, destroying most of the older wooden structures built in the French style. Municipal ordinances henceforth required buildings of a certain size to be built with brick, which gave the city a more Spanish style of architecture. Spain ceded Louisiana back to France in 1800, and France soon thereafter sold it to the United States, which formally took possession of the territory in a ceremony in New Orleans on December 20, 1803.

New Richmond (Louisiana)

British settlement established in 1763 on the eastern bank of the Mississippi River, located northwest of New Orleans and near present-day downtown Baton Rouge. A French concession established at the site in 1718 had failed by 1727, leaving the area largely devoid of a French presence. In the 1763 Treaty of Paris that ended the French and Indian War (1754–1763), France ceded to Britain its possessions in North America east of the Mississippi, with the exception of New Orleans. The Spanish also ceded Florida to the British. Simultaneously, in the Treaty of San Ildefonso, France ceded Spain its possessions in North America west of the Mississippi as well as New Orleans.

To secure their southwestern boundary in North America, on October 7, 1763, the British divided the territory gained along the Gulf Coast into East and West Florida. Pensacola became the capital of West Florida, with naval captain George Johnstone serving as the first governor. New Richmond lay within Johnstone's jurisdiction. The governor then made a series of land grants to British veterans from the recent war. New Richmond was largely a cluster of plantations established by these grants. To protect the colony from the Spanish, the British constructed Fort Bute at the juncture of Bayou Manchac and the Mississippi River, which was countered by the Spanish-held Fort San Gabriel on the opposite bank. Within months, Johnstone erected Fort New Richmond along the Mississippi River to serve as a defensive bulwark against Spanish encroachment.

In the early 1770s, Sir Wesley Dunbar, a fantastically wealthy planter, took control of a massive plantation near New Richmond by way of a land grant. Most plantation owners in the area did quite well owing to the fertile soil, long growing season, and illegal trade with Spanish-held Louisiana. By 1775, New Richmond was more of a trade and defensive center than a settlement in the strict sense of the word.

In 1778, American revolutionary James Willing began raiding British settlements along the lower Mississippi River. The Spanish governor of Louisiana, Bernardo de Gálvez, received word of the declaration of war between Britain and Spain in 1779, well before the British in West Florida. Thus, he promptly moved against Fort Bute. The British under Colonel Alexander Dickson withdrew from Fort Bute to New Richmond, where they constructed more fortifications. On September 21, 1779, British forces at New Richmond surrendered after a short Spanish bombardment. The inhabitants were given six days to declare their allegiance to Spain or lose their land and homes. The Spanish then strengthened the site into a more formidable structure known as Fort San Carlos, essentially expelling the British from the region.

The Louisiana Purchase in 1803 did not include Baton Rouge or West Florida, but by 1810 Spain's hold over the region had become untenable. That September rebels at St. Francisville declared the Spanish governor deposed and decreed establishment of the Republic of West Florida, ordering militiamen to seize Baton Rouge and Fort San Carlos. At a cost of only two Spaniards dead, the militia seized Baton Rouge. Then, on October 27, 1810, President James Madison authorized the governor of the Orleans Territory, William C. C. Claiborne, to take possession of West Florida, and on December 10, 1810, Baton Rouge became part of the United States.

New Sweden

Swedish colony established in 1638 in the Delaware River Valley that competed with other colonies for territory and trade. New Sweden officials encouraged Swedes to participate in colonial trade and agricultural ventures. Approximately 800 colonists immigrated to New Sweden aboard 12 ships during the colony's 17-year existence. Its governors often alienated colonists, natives, and trade rivals, however. Sweden did not support the colony as officials had hoped it would. Although few Swedes settled in the colony, many of those who did chose to stay after Dutch forces defeated New Sweden.

In the 1620s, Sweden's King Gustavus Adolphus considered establishing a colony in the New World, but the Thirty Years' War

Map of New Sweden, ca. 1638-1655. (North Wind Picture Archives)

(1618–1648) rendered this impossible. In the mid-1630s, Count Axel Oxenstierna, serving as regent to the young Queen Christina of Sweden, revived the plan and approved the establishment of the New Sweden Company, led by Peter Minuit. In December 1637, Minuit led 50 colonists transported in two Swedish ships into Delaware Bay. He then held discussions with Delaware (Lenni Lenape) chiefs and purchased land on both sides of the bay in present-day Delaware, Pennsylvania, and New Jersey. New Sweden encompassed the entire Jersey shore from Cape May in the south to a point opposite Chester, Pennsylvania. On the western shore, it extended from Cape Henlopen to present-day Philadelphia. The Swedish settlement, however, caused friction with the Dutch, who claimed that territory was theirs.

Few Swedes were interested in settling New Sweden because the colonial venture offered few incentives. Indeed, only an average of about 100 colonists arrived annually. New Sweden's governors repeatedly asked Swedish officials to encourage immigration, even suggesting that Sweden deport criminals, debtors, poachers, and military deserters to the colony. Crop failures in Sweden in 1650 and

1651 boosted the number of immigrants who left Sweden for the colony. In 1653, however, New Sweden counted only 200 people.

A number of Finns who lived in Sweden immigrated to New Sweden beginning in 1640. The Finns thrived by clearing agricultural fields and land for communities and forts. They also skillfully adapted plants and other indigenous materials to make such needed products as shoes and clothes. Finns benefited New Sweden's agricultural communities and peaceably coexisted with natives. Gov. Johan Björnsson Printz, who served from 1643 to 1653, disliked the Finns, however. He ordered the execution of a Finn for trading with the Dutch and Native Americans against company rules, for instance, and he jailed Finns he claimed were witches. Unhappy colonists protested until Printz left New Sweden.

New Sweden's leaders built forts to defend the colony and intimidate trade rivals. The first structure, Fort Christina, was erected near the site of modern-day Wilmington, Delaware, soon after the first colonists arrived. Other fortifications, including Fort Elfsborg and Fort New Korsholm, guarded strategic river trade routes for New Sweden. Fort Christina served as New Sweden's capital from 1638 to 1643 and from 1654 to 1655. Tinicum Island, near modernday Philadelphia, was the colony's capital from 1643 to 1653.

Swedish officials were interested in earning a profit for the company, and they saw tobacco as a viable cash crop. Efforts to grow tobacco proved unsuccessful, however. The colonists then raised grain and corn.

Swedish, English, and Dutch officials disputed land claims adjacent to the Delaware River. The Dutch proved New Sweden's chief adversary. They resented New Sweden competing with them for the fur trade and earning money they believed they deserved. The colonies waged war when the Dutch disputed Swedish claims to specific land tracts. In 1654, New Sweden's governor, Johan Classon Rising, sent forces to seize Dutch Fort Casimer. When the Dutch responded with the capture of a Swedish supply ship, Rising refused to return the captured fort. Petrus Stuyvesant then outfitted seven ships with 600 troops, retook the Fort Casimer, and defeated New Sweden in 1655.

The collapse of New Sweden resulted in Governor Rising and 37 colonists returning to Sweden. Most of the remaining colonists willingly vowed loyalty to the Dutch, who agreed that the Swedes could continue their agricultural, religious, and government practices. They were also permitted to retain their cultural traditions. Both Dutch and English communities accepted former New Sweden colonists, hoping that they would help maintain peaceful alliances with natives.

New York

A colony controlled first by the Dutch then by the English with the important Hudson River close to its eastern boundary. New York also borders Lake Erie, Lake Ontario, and Canada. New York was originally founded by the Dutch as New Netherland, a colonial presence dedicated almost entirely to the fur trade and maritime commerce. In 1609, the Dutch East India Company, founded in 1602, hired Captain Henry Hudson to explore the region, seeking a northern route to China. In 1614, the Dutch established trading posts on Manhattan Island and on the Hudson River at Fort Orange (near modern-day Albany). In 1626, the Dutch purchased Manhattan from the natives and founded their colonial capital, New Amsterdam, at the southwestern end of the island.

Dutch settlements expanded rapidly, aided by generous land grants provided by the West India Company. However, attempts to transplant feudal society to the New World were unsuccessful, and the government had only limited control over the colony. In the mid-17th century, the Dutch and the English competed for mercantile domination of the seas. New Netherland separated the English settlements in New England and the Chesapeake region and was a source of irritation for the English Crown, particularly because Dutch colonists smuggled goods into and out of the English colonies in North America, costing the Crown valuable tax income.

In 1664, English king Charles II granted a charter to his brother James, Duke of York, for the entire region from Connecticut to Delaware, regardless of Dutch claims or earlier English charters. James sent a small fleet, supported by colonial militias and regular infantry, to enforce the claim. The Dutch, busy with a native conflict near Fort Orange, were caught unawares by the English. Although Petrus Stuyvesant, governor of New Netherland, called for volunteers to defend the colony, he was ignored by the citizens, who preferred surrender over support for a repressive Dutch government. The entire Dutch claim transferred to English control without a shot being fired and was renamed New York. At the time, the entire population of New Netherland was only 10,000. This number included 1,500 residents of New Amsterdam. The Dutch recaptured New York for a brief time in 1673 but returned it in that same year during peace negotiations.

Both the Dutch and the English in New York maintained an important relationship with the Iroquois Confederation, a powerful union of five Native American tribes in the region. Early Dutch settlers in the region, massively outnumbered by the Iroquois, sought to maintain harmonious relations with that nation. Indeed,

Contemporary illustration of City Hall and Great Dock in New York City in 1679. (North Wind Picture Archives)

the Dutch showed little interest in conquest and quickly established trading relationships revolving around skins and furs, particularly prized beaver fur. In establishing the regional fur trade, Dutch merchants inadvertently manipulated the power relationships of tribes in the northeastern woodlands. As tribes abandoned subsistence hunting in favor of continual hunting and trapping, stocks of game animals of the region quickly became exhausted. If a tribe could no longer supply the furs desired, the Dutch cultivated relationships with different tribes. In this way, members of the Iroquois Confederation, especially the Mohawks, became the dominant traders because the lands they controlled stretched from New York to the Great Lakes.

An influx of European goods and weapons provided a competitive advantage to the tribes that traded with the Dutch. When Iroquois lands became depleted of fur animals, the Dutch supplied weapons for an Iroquois assault on the Hurons, who controlled territory north of the Great Lakes. The Hurons were virtually annihilated by the war, and furs continued to arrive in Dutch trading posts

in New Amsterdam. When the fur supply dwindled and no replacement supply appeared, the Iroquois and other regional tribes became a hindrance to Dutch agricultural expansion. By 1664, the Dutch colonists had adapted practices similar to New Englanders in regard to natives. This resulted in constant tension.

With the English conquest of New Netherland in 1664 and the foundation of the middle Atlantic colonies of Pennsylvania and New Jersey, British control of the North American seaboard was consolidated. Although the colonies rarely cooperated with each other, and in fact often feuded over territory or resource rights, they shared a common language, heritage, and dislike of the French and Spanish colonies in North America. New York included a massive frontier region bordering French possessions, and thus any conflict with French colonial forces represented a direct threat to the citizens of New York.

In King William's War (1689–1697), English and French colonists took advantage of a war between the mother countries to launch a series of attacks on one another. One logical avenue of

advance for each population was through New York, using the Hudson River and the St. Lawrence River and Lake George and Lake Champlain. Any fortifications along this route were of paramount importance to both sides, thus New York became the site of brutal fighting throughout the war.

Although English colonists outnumbered French colonists by a margin of 20 to 1, the combined population of New York and New England was only five times that of French Canada, and the English colonies proved virtually incapable of any significant cooperation. In 1690, New York and New England planned a joint, two-pronged invasion of Canada. One army began in Albany, planning to attack Montreal via Lake George and Lake Champlain. After the force from Albany failed to make sufficient progress, the New England advance on Quebec faced all of the forces New France could muster to resist the invasion. The New England forces also retreated, but they blamed their failure on the New Yorkers, minimizing the prospect of cooperation in the future. After the disastrous 1690 campaign, neither New York nor New England had the resolve for a renewed attempt, and thus the war after 1690 consisted of a series of brutal frontier raids. The brunt of the war was borne by local militia units, native allies, and the noncombatant frontier population.

When Queen Anne's War (1702–1713) commenced, New York and the Iroquois Confederation, still smarting from the previous conflict, declared their neutrality. This refusal to participate greatly eased pressure on New France, as any British invasion would need a different route than the rivers and lakes used in 1690. Some Massachusetts accounts of the war accused New Yorkers of trading in items taken in French raids on New England. New York and the Iroquois remained neutral until 1709, when the promise of British regular forces lured both to provide volunteers for an assault on Quebec. The assault was not ready until 1711 and collapsed before setting foot on Canadian soil. The provincials recruited in New York proved undisciplined and poorly trained, because most were recruited from outside the ranks of the state militia.

In King George's War (1744–1748), New Yorkers generally remained aloof from combat along the northern frontier thanks to the Iroquois' neutrality. New England enthusiastically supported the war, providing troops and supplies for attacks on French fortifications, including the successful siege of Louisbourg. New York, by comparison, remained content to secure its own borders against French and allied native incursions. The French, hesitant to make an enemy out of a colony behaving in a neutral fashion, largely respected New York's territory and concentrated on defending themselves from New England attacks. When British negotiators returned Louisbourg to French control in 1748 after its capture by New Englanders in 1745, New York colonists felt vindicated in their decision to avoid active participation.

The French and Indian War (1754–1763) drew New York into conflict with French Canada on a scale greater than all previous colonial wars. In June 1754, delegates from seven English colonies met at Albany to discuss a cooperative system of defense and native diplomacy. The Albany Plan of Union called for a unified defense

structure within the colonies to eliminate the self-centered behavior of previous wars and to streamline the supply and communications systems of provincial forces. Although signed by the colonial delegates, the plan proved unacceptable to each colonial assembly, as well as to the British government, and none of the participants ratified the agreement.

Unlike previous wars, New York proved very supportive of the British efforts in the French and Indian War. It was the only colony to satisfy the requests of the British commander in chief for recruits, supplies, and transportation in 1756 and 1757. This may have been prompted by increased French and allied native activity in the Great Lakes region of western New York. By 1756, the French had constructed a series of fortifications from Lake Erie to the Allegheny River and defeated a British expedition against Fort Duquesne.

As British regular officers and colonial assemblies quarreled over troops and supplies, French forces advanced into New York. Many provincial leaders wished colonial forces to remain independent of British regular commanders. The argument delayed efforts to resist French offensives. In the summer of 1756, the French captured Fort Oswego on Lake Ontario and its garrison of 1,500 provincials. Simultaneously, with their native allies they raided largely undefended frontier settlements across western New York. Even a threat to Fort William Henry on Lake George did nothing to spur colonial efforts at cooperation. On August 9, 1757, French forces compelled the surrender of the fort, exposing the entire Hudson Valley to attack.

Early French successes in the war could do little to offset the British numerical superiority. British sea power prevented any significant French reinforcements from reaching North America, even if France had not concentrated its primary military efforts in Europe. The reverses in New York, although troublesome, were not enough to cause England to abandon any territorial claims or to cancel an invasion of Canada.

In 1758, New York was the point of departure for an invasion commanded by Major General James Abercromby headed for Montreal. He intended to follow the traditional route along rivers and lakes, but began his operations with an ill-conceived assault on Fort Ticonderoga at the southern end of Lake Champlain. Abercromby's force of more than 20,000 heavily outnumbered the Ticonderoga defenders, but his poorly coordinated assaults and failure to properly use siege artillery allowed a French counterattack to devastate his army. Major General Jeffery Amherst was forced to abandon an assault on Quebec to rescue Abercromby from total defeat. By the time of Amherst's arrival at Lake George, it was too late in the campaign season to contemplate another attempt on Fort Ticonderoga. Abercromby was relieved of his command and the invasion of Canada was delayed another year. Amherst resorted to simple raids near the Gulf of St. Lawrence and the Bay of Fundy while awaiting the 1759 campaign.

In 1759, Amherst remained in New York, determined to personally lead an invasion across either Lake Champlain or Lake Ontario to capture Montreal. To ensure colonial support, Prime Minister

William Pitt offered to equip and supply provincial troops for the offensive and to reimburse colonial assemblies for their wartime expenditures. The colonial governments responded enthusiastically, voting to raise almost as many troops as Pitt requested. Recruitment proved more difficult; the colonies raised only 75 percent of the promised troops, and the recruits were uniformly untrained and undisciplined. Amherst pressed on in spite of the difficulties, assembling 13,000 troops at Albany. His progress was delayed by small French garrisons along the route as he made parallel advances across Lake Ontario and Lake Champlain. This ensured that both bodies of water would need to be swept of French vessels before troop transports and supply vessels could safely embark.

Although Amherst greatly benefited from the French decision to abandon Fort Ticonderoga (July 26) and Crown Point (July 31), he simply moved too slowly to allow an assault on Montreal in 1759. He decided in October to establish winter quarters at Crown Point, New York, delaying the invasion for yet another year. In 1760, two armies converged in New York for a final assault on Montreal. The first, a party of 11,000 provincials and regulars, departed Albany in June and crossed Lake Ontario en route to the St. Lawrence River. The second and much smaller force mustered at Lake Champlain. A third force departed Quebec for the final assault, and in a rare display of regular and colonial cooperation, all three forces arrived almost simultaneously. On September 8, Montreal surrendered, ending the conquest of Canada and securing the New York frontier. At the Treaty of Paris (1763), France agreed to evacuate all of its North American possessions.

In the American Revolutionary War, New York played a pivotal role in the strategy of each side. Loyalties were divided there, and it was a major source of recruits for the two belligerents. In fact, New York City served as the base of British operations for much of the war. The state was also the site of some of the most important battles of the conflict, including those at Long Island and Saratoga.

New York, Dutch Capture of

Event Date: August 9, 1673

Dutch operation against New York on August 9, 1673, during the Third Anglo-Dutch War (1672–1674). The war was fought for much the same reason as the previous two Anglo-Dutch conflicts. The three conflicts were chiefly for commercial dominance and were waged mostly between the two nations' fleets. This war, however, saw the Dutch fighting for their survival against both England and France.

In November 1672, the Dutch Republic sent to sea a small squadron under Admiral Cornelis Evertsen. His force consisted of six small ships mounting a total of 115 guns. Evertsen's flagship, the *Swaenenburgh*, was a captured English frigate.

Evertsen sailed from the Dutch port of Vlissingen on November 30. His plan was to capture the English island of St. Helena in the South Atlantic. It lay astride the shipping lanes to the Far East, and in Dutch hands St. Helena could serve as a base to disrupt English trade. An encounter with an English squadron off the Cape Verde Islands, however, forced Evertsen to change his plan in favor of a raid against English possessions in the New World, with the goal of inflicting as much damage as possible on English and French shipping.

Crossing the Atlantic, the squadron sailed to the east coast of South America and the Dutch colony of Cape Orange in modern-day Brazil. It was joined there by a smaller squadron under Jacob Benckes. The ships then sailed north to raid French and English possessions in the West Indies, including the islands of Montserrat, Guadeloupe, Nevis, St. Christopher, and St. Eustatius. The Dutch then sailed north to Chesapeake Bay, where Evertsen surprised the Virginia tobacco fleet, then preparing to sail to England.

The Dutch took 11 of the English ships; some were kept as prizes and others were burned. Evertsen's little fleet now numbered 19 ships. Departing Virginia waters, Evertsen sailed for the port of New York. The Dutch ships arrived off New York Harbor on July 28, 1673, and anchored off Sandy Hook on the New Jersey shore. The English had captured the Dutch colony of New Amsterdam in the course of the Second Anglo-Dutch War (1654–1667), but its inhabitants had been allowed to remain providing they took an oath of loyalty to the English Crown. Many of the Dutch were unhappy about living under English rule, however, and several of them made their way to the squadron to inform Evertsen of their desire to see Dutch rule restored. They also reported that the English defenses were weak and that Gov. Francis Lovelace was absent.

Evertsen then decided to expand his mission and take New York. In 1673, the city had more than 2,500 citizens, most of them Dutch. New York's principal defense against seaborne attack was Fort James (formerly Fort Amsterdam). Located on the southernmost part of Manhattan Island, it commanded New York Harbor.

Evertsen's first step was to ensure that the Dutch population ashore would not side with the English. He sent a letter informing them of his impending attack. The letter stated that if they remained neutral, they would not be bothered.

Although Lovelace had been warned six months before of a possible Dutch descent on New York, little had been done to improve the city's defenses. Most of the city's cannon faced inland, and their carriages were in such poor repair that only a half dozen guns could be relied on to repel the Dutch. Troop reinforcements had been sent to New York from Albany earlier, but when the Dutch had failed to appear, these men went home. When the Dutch arrived, there were perhaps only 50 to 60 men stationed at the fort. Lovelace had left town several days before the Dutch fleet arrived, leaving Captain John Manning in charge.

On August 9, 1673, the 19 Dutch ships sailed into New York Harbor, and Evertsen sent ashore a demand for surrender. Manning sent three officers to the Dutch flagship in an attempt at delay in hopes that Lovelace would be able to send reinforcements. Evertsen refused to grant a 24-hour truce as Manning wished, and he informed the emissaries that New York would have only a half hour to surrender. When no satisfactory reply was received, Evertsen brought his ships into position and opened fire on Fort James.

As the battle began, the Dutch landed marines and sailors from the squadron. Commanded by Anthony Colve, they received an enthusiastic reception from the Dutch inhabitants. Realizing the hopelessness of the situation, after little more than an hour of cannonading, most of it by the Dutch guns, Manning ordered a white flag raised over the fort. Assisted by Dutch inhabitants, the landing force then took control of Fort James.

Evertsen installed Colve as governor of the now restored colony of New Amsterdam. New York became New Orange. Evertsen left 60 men from the squadron to hold the now renamed Fort Wilhelm Hendick and then set sail north to raid the French Newfoundland fishing industry.

Much to the dismay of New York's Dutch inhabitants, the change of control was brief. The Treaty of Westminster on February 19, 1674, which ended the Third Anglo-Dutch War, restored the colony to English control. On November 10, 1674, Colve handed over New Orange to English governor Edmund Andros.

New York Slave Revolt

Event Date: April 6, 1712

Slave uprising on Manhattan Island (New York City) on April 6, 1712, involving two dozen slaves, leading to the murder of 9

white New Yorkers. At the beginning of the 18th century, African American slaves constituted about one-fifth of New York City's population of 5,000 people. Though often treated better than those in southern plantation colonies, these slaves still resented their oppression and resisted it as best they could.

Usually, slave resistance took nonviolent forms. However, on January 25, 1708, slave owner William Hallett Jr., along with his pregnant wife and five children, were found murdered in their New York home. After the arrest of several slaves, two of them—a man and a woman—confessed to the killings. Two other men were implicated as accessories. To spread terror among the slave population, all four were executed in tortuous fashion.

Yet the fear of future slave revolts remained high among the white population. Responding to the Halletts' murder later that year, the provincial assembly passed "An Act for preventing the Conspiracy of Slaves." The law stipulated that slaves who had allegedly murdered or attempted to murder anyone except another slave, African American, or mulatto, were to be tried before a quickly commissioned court. It set the penalty for guilt at death, to be administered as the justices saw fit. Undeterred by the promise of harsh penalty, a number of slaves hailing from the African states of Koromanti and Popo, along with some Native American slaves, began plotting a violent uprising in the spring of 1712.

The slaves planned to start a fire and then attack those who responded to the resulting alarm. On the night of April 6, 1712, two slaves, Cuffee and John, who belonged to the baker Peter Vantilborough, laid a torch to their master's property. Meanwhile, about two dozen men armed with whatever guns, blades, or clubs they could procure waited in the streets for townspeople to rush to the scene. When the first contingent of New Yorkers arrived, the slaves killed nine and wounded seven others.

When word of the revolt reached Gov. Robert Hunter, he issued a general alarm and sent troops in pursuit of the slaves. As the slaves retreated, Hunter posted guards along the routes out of Manhattan and militiamen patrolled the island. Most, if not all, of the slaves involved in the insurrection were eventually apprehended, some posthumously after they committed suicide.

On April 9, a preliminary jury probing the deaths of the 9 New Yorkers cast suspicion on at least 38 slaves. Drawing on the 1708 law to prevent slave revolts, a court of quarter sessions of the peace convened on April 11. It met intermittently until June 3 to try slaves as they were arraigned. After June 3, the regularly scheduled supreme court took over the trials, which lasted into October. None of the suspected slaves had the means to mount a vigorous defense, and they were tried before juries drawn from a paranoid population.

When the trials were over, 25 slaves had been condemned and 18 acquitted. Eighteen among the condemned had been hastily executed, and a pregnant woman had her death postponed until after she delivered her child. Of those killed, 14 were hanged, 3 were burned alive, 1 was broken on the wheel, and 1 was suspended in chains without food or water. Governor Hunter eventually intervened to grant reprieves to 6 of the condemned individuals, believing that the

attorney general had been overzealous in his prosecution. The proceedings against one slave in particular drew the governor's ire. This defendant belonged to one of the attorney general's political rivals, and he had to face three different trials because the jury handed down acquittals in the first two.

Given the haste of the trials, the vigor of the prosecution, and the mood of the town, it seems likely that some of the condemned were innocent. The injustice of the trials would have been worse had the governor not intervened. Yet the convicted slaves were not the only ones who suffered. The city council and provincial assembly reacted to the revolt by passing even more repressive laws in order to control New York's slave population. And the memory of the slave revolt of 1712 probably led New Yorkers to overreact to a feared uprising in 1741.

New York Slave Revolt

Start Date: March 18, 1741 End Date: April 1741

Slave rebellion in New York City during March–April 1741. The winter of 1741 had been a difficult one for New Yorkers. The North (later the Hudson) River remained frozen into the spring. The unusual cold and heavy snow had killed livestock, and many New Yorkers were going hungry. Compounding their miseries, Britain had been at war with Spain for two years (Anglo-Spanish War, 1739–1744). Many feared that the time was ripe for a Spanish naval assault on the city. A Spanish attack seemed logical because earlier in the winter part of the crew of a captured Spanish ship had been brought to New York. When the black men among them could not prove that they were freemen, the court of admiralty allowed their sale as slaves. With the Spanish promising to retaliate, many New Yorkers also began to fear that these slaves in particular might foment a revolt.

With New York's African Americans comprising about 2,000 of the city's 11,000 people, the overwhelming majority of whom were enslaved, New Yorkers had good reason to fear a slave rebellion. Indeed, the New York slave revolt of 1712 was still part of the community's memory. That uprising had resulted in the deaths of 9 whites and the executions of 19 slaves.

Fire broke out on March 18, 1741, at Fort George, the heart of the colonial government in New York. When the flames died down, the royal governor's house and numerous other government buildings lay in ashes. One soldier had been killed. Although the cause of the fire was unknown, more fires broke out a week later, prompt-

Two slaves being burned at the stake for their participation in a slave revolt in New York in 1741. Colonial officials hanged 4 whites and 18 slaves. Another 13 other slaves were burned at the stake. (Hulton Archive/Getty Images)

ing New Yorkers to suspect arson and abandon their homes. With officials desperate to find the cause of the fires, a woman stepped forward on April 5 to report that she had overheard a slave make a cryptic comment about fire to a companion. When two more fires broke out on April 6, rumors began circulating that the slaves acquired from the Spanish ship were part of a larger slave plot.

The testimony of Mary Burton, a 16-year-old white indentured servant who had been arrested for robbery in February 1741, gave authorities evidence that supported popular rumors. Burton had already accused her master, John Hughson, of criminal activity. Before a grand jury convened in mid-April, she charged him with overseeing the conspiracy. In further questioning she gave enough information to implicate a number of slaves and whites in the plot. The implicated whites tended to belong to disaffected groups—criminals, Irish conscripts, and Roman Catholics. In further proceedings, accused individuals named more alleged conspirators, and the grand jury testimony stretched until August 1742.

The only surviving record of the proceedings comes from the journal of Daniel Horsmanden, who was the city recorder and a

judge at the trial. Historians debate the potential biases of this document, but certain facts from the proceedings are clear. The laws of conspiracy made suspect even those who might have passively overheard rebellious plans. Thus, it is not surprising that a sizable number of people faced trial.

Most of the 20 whites and approximately 150 African Americans arrested were denied legal counsel. At the same time, the prosecution had the services of the city's best legal minds. Equally problematic for the enslaved defendants was the fact that they were tried in groups, rather than as individuals. On the other hand, the slaves were at least allowed hearings in the same court as whites, a rather unusual occurrence in colonial America. Many defendants confessed to crimes with the hope that it would save their lives. Usually it did not.

The mostly forgotten proceedings of 1741 resulted in more deaths than the Salem Witch Trials of the late 17th century. In the end, based solely on questionable and flimsy evidence, colonial officials hanged 4 whites and 18 slaves. Thirteen other slaves were burned at the stake, and 70 were sold and shipped away, mostly to the West Indies.

Niagara, Treaty of Event Date: August 1764

Agreement between some 44 Native American nations and the British signed at Fort Niagara (New York) in August 1764. The British undertook the negotiations in an attempt to end hostilities with Native Americans that had begun the previous year with Pontiac's Rebellion. The treaty also affirmed the Proclamation of 1763 and recognized the nation-to-nation relationship between the American Indians and the British. In a significant way, the negotiations attempted to deal with the postwar order after the long and destructive French and Indian War (1754–1763).

In late 1763, Sir William Johnson, Britain's superintendent of Indian Affairs for the northern colonies, called for a peace conference to take place in the summer of 1764. He sent messengers carrying strings of wampum and copies of the Proclamation of 1763 to the natives. The message reached as far away as Nova Scotia in the east, Hudson Bay in the north, the Gulf of Mexico in the south, and the Mississippi River in the west. As a result, approximately 2,000 indigenous people representing roughly 44 nations attended the

peace conference. Chief Pontiac, one of the key leaders of the anti-British faction, however, was not present. He would sign a separate peace in 1765.

The Niagara Congress convened and met in July 1764. During the negotiations, Johnson attempted to use a "divide and conquer" technique to ensure a swift agreement. The chiefs, though they met with Johnson independently, kept each other abreast of their discussions. The final agreement was reached in August. A hybrid of two worlds, the accord was symbolized in wampum, with the two-row wampum belt used to symbolize native understanding of the agreement. The treaty was also written out for British officials.

The terms of the treaty included an exchange of prisoners, reestablishment of British gift giving, promises to prosecute whites who committed crimes against natives, compensation for white traders' losses, a schedule of value for trade goods, and promises of open and free trade. It also stipulated that there must be protection against mutual enemies, no settler encroachments on native territory, free passage across the frontier for natives and traders alike, and a native promise to cease contact with British enemies.

Details of the Niagara Treaty continued to influence native-Canadian/British treaty negotiations into the 19th century. For example, in 1836, when negotiating a treaty on Manitoulin Island, Chief Assickinack reminded the lieutenant governor of Upper Canada, Sir Francis Bond Head, of the terms of Niagara. In Canada, the 1764 Treaty of Niagara and the Proclamation of 1763 represented a charter for the Native Americans' relationship with the Crown.

Nicholson, Sir Francis

Born: November 12, 1655 Died: March 28, 1728

British Army officer and colonial governor. Born on November 12, 1655, at Downholme Park in Yorkshire, England, Francis Nicholson entered the King's Holland Regiment in 1678 as an ensign and saw service in Flanders toward the end of the Third Anglo-Dutch War. From July 1680 to February 1684, Nicholson served under Colonel Percy Kirke in the Tangier Regiment, when Tangier was

garrisoned by the English. On his return to England, he served in Kirke's command during the suppression of the Duke of Monmouth's rebellion against James II in 1685. Although Nicholson may not have fought at the Battle of Sedgemoor, he was involved in the ruthless suppression that followed that battle.

Following Monmouth's rebellion, Nicholson was rewarded for his service to James II, who promoted him to captain and dispatched him to the newly created Dominion of New England in 1686. On his arrival in the dominion, Gov. Sir Edmond Andros appointed Nicholson to the Governor's Council. Two years later Andros named Nicholson lieutenant governor and assigned him to New York. When news of the Glorious Revolution of 1688 reached the colonies in the spring of 1689, Nicholson hesitated to acknowledge William III and Mary II until he received formal instructions. Consequently, Nicholson was toppled by Leisler's Rebellion.

Although Nicholson had been part of James II's administration, he succeeded in winning the support of William III and Mary II after the Glorious Revolution. In May 1690, Nicholson was appointed lieutenant governor of Virginia and would spend the next 15 years in the Chesapeake serving as lieutenant governor of Virginia, governor of Maryland, and governor of Virginia. He returned to England in April 1705.

An ardent advocate of aggressive action against the French in North America, Nicholson was dispatched to the colonies with the rank of colonel in 1708 during Queen Anne's War (1702–1713) and instructed to organize an invasion of New France. With approximately 3,000 troops under his command, Nicholson established a chain of stockades from Albany to Lake Champlain in anticipation of an advance on Montreal. In late summer 1708, however, Nicholson received news that London had cancelled the naval component of Nicholson's planned two-pronged attack. Nicholson returned to London and vigorously encouraged the cabinet to reconsider his plans to invade Canada. Revealing a capability for showmanship, Nicholson took 4 Mohawk warriors with him and they quickly became a popular sensation in London and contributed to the ministry's decision to approve Nicholson's plans.

Returning to New England in May 1709 with the rank of brigadier general, Nicholson organized the highly successful invasion of Nova Scotia. Moving swiftly to publicize his victory, Nicholson returned to London and received a hero's welcome. Promoted to lieutenant general in 1711, Nicholson was sent back to the colonies to command a planned assault on Quebec. As Nicholson advanced up the Lake Champlain corridor, however, the Royal Navy lost half of its force while sailing up the St. Lawrence River, ruining any chance for success.

Although Nicholson's 1711 campaign against Quebec would mark his last field command, he continued to serve in the colonial administration. From 1713 to 1715, he served as governor of Nova Scotia, and from 1720 to 1725 he served as governor of South Carolina. Nicholson died in London on March 28, 1728.

Nipmucks

Native American people belonging to the Algonquian linguistic group who lived primarily in east-central Massachusetts. Several small bands of Nipmucks lived in northeastern Connecticut and northern Rhode Island as well. Nipmuck means "Fresh Water People" and refers to their living inland, away from the coast. The Nipmucks were relatively small in number, perhaps about 5,000 people in 1620. They were very loosely organized and militarily weak. As such, they frequently saw their territory dominated by neighboring tribes—particularly the Wampanoags, the Pequots, the Narragansetts, the Massachusetts, and the Pennacooks. The Iroquois people and the Mohegans also viewed the Nipmucks as their enemy.

Like other New England Algonquian speakers, the Nipmucks lived in local bands of a few hundred. Each band settled in a village for part of the year and traveled over its territory to hunt and gather food the rest of the year. A head sachem (chief) and a council of lesser sachems led each band, making such decisions as whether to go to war. Limited warfare among rival bands occurred frequently. But slaughter with the goal of total annihilation did not take place until English colonists introduced their own brand of take-no-prisoners warfare.

Most of the Nipmuck bands had bowed to the authority of Massachusetts Bay Colony by the mid-1600s. With their population depleted by European diseases and intertribal warfare, a number of the remaining Nipmucks turned to Christianity. Under the influence of such Puritan preachers as John Eliot, they viewed their plight as a sign of the English god's supremacy over their own. During the early 1670s, the Christianized Nipmucks began living in the so-called praying towns of Massachusetts.

English offenses against the Nipmucks soon outweighed Christian influences, however. Matoonas, once a loyal Nipmuck convert, became a leading adversary when the English executed his son on

a false charge. On August 1, 1675, a Nipmuck force led by former converts Matoonas and Muttawump ambushed a group of English troops that had come to open peace negotiations. When the surviving English took refuge in Brookfield, some 200 Nipmucks laid siege to the town until English reinforcements arrived three days later. By the autumn of 1675, most of the recently converted Nipmucks deserted the praying towns to join Metacom and the Wampanoags in prosecuting King Philip's War against the English. Only a few remained loyal to the Puritans and relocated to another tribe's praying town. During the war, bands of Nipmucks joined other combatant bands in raiding Massachusetts frontier towns, including Deerfield, Hadley, Northampton, and Springfield. At peak strength, Muttawump commanded a mixed force of some 700 warriors from Nipmuck and allied bands.

Probably fewer than 1,000 Nipmucks survived the war. The English sold some survivors into slavery in the West Indies and consigned others to reservations or praying villages. A few escaped to take refuge with other native bands and joined in attacks on English frontier towns during later uprisings.

The presence of Nipmuck refugees among the Pennacooks of New Hampshire brought about another episode of betrayal and revenge in New England–native relations. In 1676, New Hampshire Militia commander Richard Waldron invited a party of Pennacooks and Nipmucks to visit him then seized the Nipmucks and shipped them off for punishment, execution, or slavery. His betrayal enraged and humiliated the Pennacooks. They waited 13 years for the opportunity to take revenge, torturing Waldron to death.

Norridgewock, Battle of Event Date: August 12, 1724

New England raid against the Eastern Abenakis' main village at Norridgewock, Maine (then part of Massachusetts), during Dummer's War (1722–1727) on August 12, 1724. The objective of the raid was to capture or kill Father Sébastien Râle, a French Jesuit missionary believed by New Englanders to have fomented the conflict. After years of increasing tensions, Gov. Samuel Shute of Massachusetts declared war on the Abenakis in July 1722, beginning

Dummer's War. New Englanders blamed Abenaki resistance on French machinations, rather than their own land hunger and duplications trade and diplomacy.

To English thinking, the French mission at Norridgewock, some 75 miles up the Kennebec River, was the heart of the rebellion. The New England colonists portrayed Râle as a religious fanatic who had encouraged the Abenakis to purge English Protestant heretics from North America. The reality was far more complex. For over two decades, the Jesuits had lived among the Abenakis and championed their interests, often forcefully, against English demands.

After two years of a frustrating guerrilla war, the New Englanders targeted Norridgewock. They did so to arrest Râle but in reality to break the rebellion. On August 8, 1724, Captain Johnson Harmon and a force of some 200 militiamen and a few native scouts left Fort Richmond, a small post 25 miles up the Kennebec. The group traveled by whaleboat upstream to a point just south of Norridgewock. Leaving 40 men to guard the boats, Harmon's force marched overland.

The attackers were undetected and reached the village's outskirts by midday on August 12. Harmon took half the force to scour surrounding cornfields, leaving the actual attack on the village to his second-in-command, Captain Jeremiah Moulton.

Moulton's men approached Norridgewock from the west and soon cordoned off the northern and southern approaches. This left the only avenue of escape eastward by means of the Kennebec River. Achieving near total surprise, the attackers fired into the village while Abenaki warriors scrambled from their dwellings, trying to purchase time for their families to escape. The New Englanders, however, quickly overran the village and pursued their escaping foes, shooting many as they sought to cross the river.

In the fighting roughly 30 Abenakis were killed, among them many prominent warriors. Some historians have suggested that the death toll may have been higher, however. Moulton's force lost 1 New Englander and 1 native scout. As many as 150 Abenakis escaped to other French missions. Râle was among the dead. English and Abenaki accounts offer several versions of his death. The English portrayed the Jesuit as either actively leading the Abenakis, or firing on the militia from a dwelling. Abenaki accounts, relayed by French missionaries, depicted the unarmed missionary confronting his attackers and dying at the foot of a cross. Allegedly, his body lay amid several of his converts, who died shielding him with their own bodies.

With dusk approaching, the English spent the night in Abenaki dwellings. After pillaging and burning the town the following morning, Harmon's force returned to English territory. Harmon arrived in Boston to a hero's welcome, complete with a number of Abenaki scalps and that of Râle in order to collect a £100 reward.

The attack on Norridgewock eliminated a major obstacle to further English expansion in the Kennebec River Valley. Râle had openly challenged New England's aggressive policies, and his death and the destruction of the Eastern Abenaki village at Norridgewock

weakened that nation, although the war continued for three more years.

Norteños

A term used by the Spanish in reference to certain Native American tribes, mostly in the interior regions of what is present-day Texas. Norteños translates as "nations of the North," in reference to the natives living north of Spain's colonial Mexican holdings. In the early 1700s, Spain had limited its settlements in Texas chiefly to the area northwest of San Antonio and Natchitoches. It did so because of French incursions from Louisiana beginning in 1699, with the establishment of Baton Rouge. To blunt this, the Spanish launched the large-scale Aguayo Expedition (1720–1722), which helped them check French expansion, reassert control over the region, and spread Catholicism.

Eventually, Spanish authorities established 10 missions and 4 presidios to cement Spanish influence in northern and western Texas. At the same time, Native American refugees from other parts of the continent were reforming as "refugee tribes" on the southern plains of Spain's northern frontier. These tribes became the Norteños when they had acquired horses from Spain and firearms from the French. Indeed, in the 1700s the Comanches, the Kitsais, the Tonkawas, and the Wichitas proved to be some of the most formidable light cavalry soldiers in the world. An excellent example of this was the Norteño raid on the mission and presidio established at San Sabá in northwest Texas in April 1757. The mission had been established several miles downstream of the presidio to Christianize the Lipán Apaches in the area. Almost immediately, the Norteños began raids against their old enemies the Apaches, and the presumed allies of the Apaches, the Spanish. On March 16, 1758, a large force of Norteños attacked, looted, and burned Mission San Sabá, killing 8 Spaniards and several Apaches there. In December, a Comanche band killed 21 Apaches near the presidio, and in March 1759, 19 Apaches died trying to protect the presidio's herd of horses.

On September 1, 1759, a large Spanish force commanded by dragoon colonel and San Sabá commandant Diego Ortiz Parrilla left San Antonio for San Sabá to punish the Norteños. The force of 576 included 176 mission native warriors, 1,500 horses, several hun-

dred mules, several cannon, and provisions of dry beef, flour, corn, and beans. On October 1, they surprised and routed a Norteño ranching outpost, killing 55 Tonkawas, capturing 150 others, and taking 100 horses.

The Spanish force pressed on to the Red River on October 7, where they were lured into a Norteño trap. Following fleeing Norteños, the expedition came on a fortified Wichita village near present-day Spanish Fort on the Red River. Surrounded by quick-sand, the settlement was being watched by 11 different bands of well-armed Norteños hidden along the river banks. The Norteños then struck when the Spanish least expected. Spanish horses became bogged down, and 11 cannon rounds proved ineffective. The four-hour battle ended at dark with a rout of the Spanish. Their losses were 19 men killed, 14 wounded, 19 others lost by desertion, and all the cannon lost. Presumably the Norteños also captured many horses and provisions.

Norteño warfare proved so troublesome for Spain that imperial officials called for redesigned presidios and other strongholds and the adoption of tactics that would allow Spanish soldiers greater flexibility to pursue attackers. By the 1770s and 1780s, New Spain had engaged many of the Norteños in peace talks. Peace generally held after that, although Spanish settlements were never completely free from the Norteño threat. Small bands of Norteños, unwilling to negotiate peace with the Spanish, continued to hound settlements and missions into the early 19th century.

North Carolina

Southern colony first settled by the English in 1587 and part of the Carolina colony until the region was split into North and South Carolina in 1712. The area had first been explored by Giovanni da Verrazzano in 1523–1524 on behalf of the French, and the Spanish further explored the coastal regions of North Carolina in the 1540s. In 1526, Lucas Vásquez de Ayllón tried unsuccessfully to found a settlement near modern-day Myrtle Beach, South Carolina. During the 1560s, several other Spaniards scouted the area, but no serious efforts were undertaken to establish settlements there.

In 1585, Sir Walter Raleigh, at the behest of Queen Elizabeth I, sent a contingent of 100 people to settle at Chesapeake Bay, but the expedition instead landed at Roanoke Island. The settlement was

quickly abandoned, however. In July 1587, another contingent of would-be colonists went ashore at Roanoke Island. In 1590, when an English supply ship finally made its way back to the island, there was not a trace of the colonists. One of the great mysteries of North American colonization, the disappearance of the settlers has been attributed to hostile natives, food shortages made worse by drought, and diseases such as yellow fever. The eastern region of the colony was later populated by English settlers moving south from the Virginia settlements.

In 1663, King Charles II established a proprietary government in Carolina under the governance of eight lords proprietors. The colony loosely encompassed an area from the mouth of the Savannah River in the far southeast, to the Virginia border in the north, and to Chesapeake Bay in the far northeast. From 1663 to 1729, the proprietary government suffered from internal rebellions, mismanagement, and problems with the native population. The major Native American groups inhabiting the region were the Cherokees, the Tuscaroras, the Catawbas, and the Saponis. Some Creeks were also present. There were numerous smaller tribes, and the region was home to a diverse set of American Indians that represented three distinct language groups: Iroquoian, Algonquian, and Siouan. Between the 1660s and 1680s, settlements began to emerge in the eastern quarter of North Carolina. In 1691, Carolina was further consolidated with a governor residing in Charles Town (presentday Charleston, South Carolina). The colony was separated into North and South Carolina in 1712, although North Carolina was still within the control of the South Carolina governor (North Carolina had a governor who reported to Charles Town). In 1729, the remaining lords proprietors sold their claims back to the British Crown, and North Carolina was established as a royal colony.

By the early 1600s, the northeastern region of the colony had become an area of conflict between the incoming settlers and Native Americans like the Tuscaroras. During the period of the proprietary government, the English settlers were unable to defend or even mount counterraids against natives because of the inefficient colonial government. North Carolina invariably had to rely on either Virginia or South Carolina to come to its assistance with troops and supplies.

The best example of this problem was the Tuscarora War of 1711–1713. Initially, the Tuscaroras, under the leadership of Chief Hancock, attacked a number of white plantations around the area of Bath and New Bern, North Carolina. The colony requested assistance from South Carolina, and a force of soldiers and native allies under the command of Captain John "Tuscarora Jack" Barnwell arrived in the area in January 1712. By April, Barnwell had arranged a truce with the Tuscaroras.

Unsatisfied with the result of the campaign, however, North Carolina appealed to Virginia, but refused to supply the expected troops. Virginia withdrew its offer, whereupon another South Carolina expedition under the command of Colonel James Moore Jr. returned to the region in March 1713. His force of 900 warriors and 30 whites captured the Tuscaroras' Fort Nohoroco and effectively

destroyed the power base of the tribe. After the Tuscarora War and Yamasee War (1715–1717), settlers began streaming into North Carolina, which now seemed relatively safe from large-scale native attacks. Between 1730 and 1765, it is estimated that the colony's population jumped from some 30,000 European inhabitants to as many as 200,000. During the various wars of imperial conquest, North Carolina was not altogether immune from depredations. Both the Spanish and the French raided the coast during Queen Anne's War (1702–1713), and such activities were repeated during King George's War (1744–1748). Indeed, during 1747–1748, Spanish privateers ravaged ports from Brunswick to Beaufort.

During the French and Indian War (1754–1763), the North Carolina frontier became a battleground that pitted French-allied native tribes against the North Carolina settlers. This fighting was centered in the foothills of the Appalachian Mountains. The possibility of native raids forced the North Carolina General Assembly to construct Fort Dobbs, named after the royal governor, Arthur Dobbs, in the Carolina Piedmont.

Native attacks increased in 1759 when French agents sent from Fort Toulouse took advantage of colonists' murders of several Ckerokees to incite that nation, formerly a British ally, to war. During March and April 1759, Cherokee raiding parties struck in the area in and around the Catawba River Valley and Yadkin River Valley. Fort Dobbs was then reinforced with colonial troops pulled from the coastal fortifications and ranger companies raised by the colonial government. This was the opening salvo of the Cherokee War (1759–1761).

With increased violence on its frontier, South Carolina appealed for assistance from both North Carolina and Virginia. Governor Dobbs dispatched a company of militia to assist South Carolina. In 1760, two British expeditions advanced into the South Carolina frontier to bring an end to the Cherokee attacks. The first campaign, under the command of Colonel Archibald Montgomery, resulted in an indecisive engagement at the town of Echoe, where the advantage of the British advance was negated by the failure of North Carolina and Virginia to move against the Overhill settlements. In 1761, British lieutenant general James Grant employed a combined force consisting of British soldiers, colonials, and native allies to defeat the Cherokees. Several months later, the Cherokees sued for peace with both North and South Carolina. In 1763, King George III established a "proclamation line" of 40 miles to separate the Cherokee towns and the English settlements in western North Carolina. This resulted in a briefera of relative calm before colonial-native clashes resumed late in the decade.

Northfield Fortifications (Massachusetts)

The Northfield Fortifications were a succession, as well as a collection, of defensive British outposts. These works were situated at the American Indian village of Squakeag, just west of the Connecticut River in what was then northwestern Massachusetts. The English settled Northfield in 1670, and until 1724 it served as the northernmost outpost in the Connecticut River Valley. Like many in its day, this town was a center for both trade with, and defense against, the native tribes of the region.

The Northfield forts first served against autonomous American Indian tribes, but over time also helped to protect Massachusetts against French and allied native incursions.

The first of the Northfield forts was constructed in 1673, a log garrison surrounded by a palisade. Two years later, the fort played a minor role in the skirmish at Beers Plain during King Philip's War (1675–1676). Metacom (King Philip) used the fort as a temporary base of operations in 1675. The following year, 1676, the colonists retook, rebuilt, and improved the fortifications. The colonists added additional outworks and redoubts in 1685, 1686, and 1688. Nevertheless, the fort was again destroyed during King William's War (1689–1697) in 1690, this time by American Indians supported by the French.

For the remainder of King William's War and throughout Queen Anne's War (1702–1713), Northfield remained unfortified. After the fighting ceased, the area was again resettled. The English erected two separate forts in 1722, and several garrison houses in 1724. These fortifications helped to protect western Massachusetts from the threat posed by French forces based at Crown Point during King George's War (1744–1748).

Peacetime retrenchments brought a temporary end to the Northfield forts in 1753. But French hostilities prompted their rebuilding in 1754. There were then four Northfield forts defending the Massachusetts frontier, but the British by this time had more advanced posts opposed to Crown Point. The new fortifications were therefore probably never tested by the French and their American Indian allies and were, in any case, rendered obsolete by the Treaty of Paris in 1763.

Nottoways

Native American tribe that lived along the modern-day Nottoway River in southeastern Virginia and in northeastern North Carolina. When the English founded Jamestown in 1607, the Nottoway population was estimated at some 1,500 people. They were of Iroquoin background, which sometimes led to tensions between them and their Algonquian neighbors. Nottoway is an Algonquian term meaning "snake" or "adder." The name stuck when Europeans began using it.

Initially, the 40-mile distance between Nottoway villages and Jamestown limited their interaction with white colonists. Their relative proximity to the coasts of Virginia and North Carolina, however, placed the Nottoways directly in the path of future English colonial expansion. During his infamous rebellion in 1676, for example, Nathaniel Bacon attacked the Nottoways and surrounding tribes, leading the natives to sign a 1677 treaty promising friendship to Virginia.

The outbreak of the Tuscarora War in North Carolina in 1711 divided the Nottoways. Gov. Alexander Spotswood of Virginia marched a militia force to the main Nottoway town to prevent its inhabitants from joining the uprising. The action had some success, and in 1712 the Nottoways pledged peace in return for the right to trade for muskets and ammunition. Not all of the Nottoways apparently agreed, however, as some joined their Iroquoin neighbors, the Tuscaroras. When the Tuscaroras lost, they and some of the Nottoways fled to New York, where they became the sixth nation in the Iroquois Confederation. The Nottoways who remained behind in Virginia thereafter enjoyed relatively good relations with their white neighbors. They supported the British colonists in the French and Indian War and then the American side during the American Revolutionary War.

A possible exception to this friendly pattern was a burst of violence along the South Carolina frontier during the late 1740s and early 1750s. Two white Charles Town (present-day Charleston) traders, George Haig and Thomas Brown, were killed by a mixed group of "Notowega" natives. Contemporaries identified some of them as Conestogas or Senecas. But the clear Iroquoin identification of the group has led to speculation that at least some of them were Nottoways. After several years of clashes with South Carolina settlers, the Nottoways retreated to Cherokee territory and disappeared.

After the Tuscarora War, the Nottoways in Virginia declined in numbers. In 1728 William Byrd estimated their population at just 300. A 1764 report described the Nottoways and their lesser neighbors as collectively having 60 warriors. The pattern continued so that, by the end of the American Revolutionary War, Thomas Jefferson exaggeratedly reported that not a single male Nottoway still lived. A census in 1825 counted only 47 Virginia Nottoways. Although the name Nottoway is still used by some northern Iroquois tribes, descendants of the Virginia band today call themselves the Cheroenhakas.

Nutimus

Born: ca. 1680 Died: 1763

Delaware (Lenni Lenape) sachem chief who became the principal spokesperson for the tribe, particularly in regard to relations with English settlers. Nutimus (meaning "one who spears fishes") was born around 1680, most likely in modern-day New Jersey in the region of the upper Delaware River Valley. His tribe occupied territory in present-day Northampton County in eastern Pennsylvania near the Lehigh River and the Delaware River. Thanks to the beneficence of its founder, William Penn, the colony dealt fairly with Native Americans. But rising debt among Penn's heirs to the proprietorship, sons John and Thomas, set the stage for a betrayal.

In 1735, Thomas Penn produced a dubious contract purportedly negotiated in 1686 that ceded to the proprietors as much native-held territory as could be traversed in a day and a half of walking. Nutimus objected and threatened to press his case through the Iroquois Confederation. The Penns, however, forestalled the move through separate negotiations with the Onondagas, who were members of the confederation. Iroquois leaders ignored the fraud because they saw an opportunity to establish themselves as the sole agents for the British in handling questions of land rights.

In 1737, Nutimus officially acquiesced and subjected his people to the so-called Walking Purchase. He cried foul as the whites hired as "walkers" took few breaks and ran for portions of their trek. The Penns ultimately claimed 1.2 million acres based on a 65-mile journey. By 1740, Nutimus had resumed efforts to enlist the support of other tribes in redressing his grievance. But in 1742, the Onondaga chief, Canasatego, with prompting from Gov. George Thomas of Pennsylvania, admonished Nutimus. Referring to the Delawares as "women," Canasatego evicted them from their land without allowing them any right to sell it.

The Delawares relocated to Pennsylvania's Wyoming Valley by the northern branch of the Susquehanna River. Their ongoing lobbying for the abrogation of the bogus treaty lasted 19 years, but came to no avail. One of Nutimus's followers and a subsequent chief, Teedyuscung, secured a royal investigation into the matter. Quakers disenchanted with the Penn family had by then taken up the cause of the Delaware tribe. Teedyuscung withdrew his claim before a hearing could be held, however. Nutimus lived out his remaining years in relative solitude, although he did engage in diplomacy with Superintendent of Indian Affairs Sir William Johnson in 1756 to earn his tribe recognition as an independent nation.

Nutimus died in 1763 during Pontiac's Rebellion. Although neither he nor his village were involved in the hostilities, the settlement was nonetheless raided and destroyed by colonial forces. It is believed that Nutimus died during the attack.

Oconostota

Born: ca. 1712 Died: 1783

Great warrior (primary war leader) of the Cherokee Nation in the third quarter of the 18th century and later a revered leader of the Cherokees during some of the most violent and turbulent events in Cherokee history. Born about 1712, by 1753 Oconostota had become the great warrior for the Overhill town of Chota, which had gained preeminence over all the Cherokee towns. This in effect made Oconostota the great warrior for the entire Cherokee Nation.

During the years leading up to the Seven Years' War, Oconostota favored an alliance with the French over the existing Cherokee alliance with the British. Another great Cherokee chief, Attakullakulla, opposed him on these matters as a staunch leader of the more popular British faction. In any case, the French were unable to maintain the supply of weapons, ammunition, and other European trade goods that the British were able to furnish, and this left Oconostota and others favoring the French a minority of the Cherokees.

Despite his desire to ally with the French, Oconostota led numerous war parties against French-allied natives during the 1750s as the Cherokees' alliance with the British strengthened. In 1753, he led some 400 warriors against the Choctaws to provide assistance to the Chickasaws at the behest of Gov. James Glen of South Carolina. Oconostota and his Cherokees administered a decisive defeat on the Creeks in the Battle of Taliwa, forcing the Creeks to leave northern Georgia. Then in 1755, during the French and Indian War (1754–1763), Oconostota led numerous war parties against the French-allied natives in Illinois. Finally, in 1757, he led raids against French trading boats and canoes on the Mississippi River and the Ohio River.

Unfortunately for the Cherokees and the colony of South Carolina, relations between the Cherokees and the British soured in

1759 as some unscrupulous Virginia Rangers attacked a Cherokee war party returning home after fighting for the British in the Ohio Valley. This incident led to an outbreak of hostilities along the Cherokee-Carolina frontier known as the Cherokee War (1759–1761). Oconostotaled a Cherokee peace delegation to Charles Town (present-day Charleston, South Carolina) to resolve the situation, but Gov. William Lyttelton took the Cherokee delegates hostage and then accompanied them and South Carolina forces to Fort Prince George among the Cherokee Lower Towns. There Governor Lyttelton demanded that in exchange for the release of the chiefs, the Cherokees surrender those responsible for the killing of two dozen settlers. Lyttelton had hoped to use his military force to chastise the Cherokees, but an outbreak of smallpox dispersed his men.

Eventually Attakullakulla secured the release of some of the chiefs, including Oconostota. He immediately led a Cherokee attack on Fort Prince George, which brought the immediate execution of the remaining Native American hostages. The attack also brought a South Carolina punitive expedition. Archibald Montgomery and James Grant led a mixed force of regular British troops (most of them Highlanders) and militiamen against the Cherokees. The troops destroyed many of the Lower Cherokee towns. On June 1, Oconostota and the Cherokees repulsed Montgomery at Etchoe, about six miles south of present Franklin, North Carolina, whereupon Montgomery retired to Charles Town.

Oconostota then led a Cherokee siege of Fort Loudoun in present-day Tennessee. The garrison surrendered in August, marking the worst defeat of a British force at the hands of Native Americans until Pontiac's Rebellion of 1763. Although the garrison had been promised safe conduct, the Cherokees attacked the troops as they withdrew, killing a number exactly equal to the Cherokee hostages killed at Fort Prince George.

In 1761, Oconostota traveled to New Orleans to seek French assistance, but he was unable to secure any meaningful military aid. In the spring of 1761, Colonel James Grant led some 2,400 South Carolinians against the Cherokees. He avoided an ambush near the site where Montgomery had been defeated and was victorious over the Cherokees. Grant and his men then attacked the middle Cherokee settlements, destroying some 15 towns and a great many crops. The Cherokee War was concluded that same year.

Although the war had been a serious setback for the Cherokee Nation, Oconostota remained an important leader. Indeed, from 1764 he was effectively leader of all the Cherokees. In 1768, Oconostota led delegations to meet with both the Iroquois and representatives of Virginia to draw a new boundary line between Cherokee lands and that colony. The Virginians almost immediately broke the agreement.

Preferring peace to war, in 1775 Oconostota signed an agreement with North Carolina lawyer Richard Henderson that ceded more than 20 million acres of Cherokee land in middle Tennessee and Kentucky. In 1776, some Cherokees attacked colonial settlements along the frontier from Virginia to Georgia, leading to savage settler reprisals against Cherokee towns. The Cherokees agreed to peace in the spring of 1777, with Oconostota playing a key role in the talks. Some Cherokees fought on the British side in the American Revolutionary War, but Oconostota opposed this. Oconostota remained the revered leader of the Cherokee Nation until his death in the spring of 1783.

Oglethorpe, James Edward

Born: December 22, 1696 Died: June 30, 1785

British general, member of Parliament, and founder and governor of Georgia (1733–1743). James Oglethorpe was born in London,

James Edward Oglethorpe, founder of Georgia, shown here with his Chickasaw allies during the Spanish attack on the English colony in 1743. Wood engraving from 1887. (The Granger Collection)

England, on December 22, 1696, and was reared in typical upperclass fashion. After some schooling at Corpus Christi College at Oxford, Oglethorpe joined the Austrian Army in 1716. He served with considerable distinction in fighting against the Ottoman Turks.

By 1719, Oglethorpe had returned to England and was elected to the House of Commons in 1722. After a personal friend died in debtor's prison, Oglethorpe led a commission to investigate prison conditions, and he prepared a special report in 1729 that highlighted the atrocities of confinement.

Looking for a solution to such injustices, Oglethorpe believed that the New World could provide a haven for England's hardworking, honest poor. He hoped to establish a colony that would provide a fresh start for debtors and where yeoman farmers and small merchants could also flourish. Oglethorpe's concept involved no large land grants to individuals, no liquor, and no slavery. Individual families would work their own small plots of land with their own labor. The area he envisioned as a colony would also serve as a buffer zone between English settlements in lower Carolina and Spanish settlements in Florida.

Oglethorpe landed in the New World at Charles Town (present-day Charleston, South Carolina) in 1732 and immediately began preparing the area south of the Savannah River for settlement. He formally founded Georgia in February 1733 to provide a haven not only for the poor and disposed but also for the religiously persecuted.

Oglethorpe served as governor of Georgia for 10 years (1733–1743), during which time the colony became modestly successful. The lure of slaves and liquor in nearby colonies, however, created a steady migration out of Georgia. The new colony did function fairly well as a buffer between South Carolina and Spanish Florida.

When the Anglo-Spanish War (1739–1744) began, Oglethorpe's fledgling colony faced serious threats. Oglethorpe, then a colonel, decided to make a preemptive strike against the Spanish. He led a force of men south and laid siege to St. Augustine and the Castillo de San Marcos for 38 days in the summer of 1740.

Early victories in the St. Augustine campaign were overshadowed as Oglethorpe's combined land-sea plan of attack fell apart. Although he had strong Native American allies, Oglethorpe did not have many white soldiers available to fill the ranks. The expedition suffered a major defeat on June 15 at Fort Mosé, which brought Oglethorpe's military skills into question, especially when he repeatedly divided his troops and seemed to have no resolute plan of attack. Spanish reinforcements arrived on July 3, 1740, and the English, knowing they then had no chance to take the town, withdrew the following day.

Oglethorpe's opportunity to redeem himself came in July 1742. The Spanish had planned to take Georgia and then move on to Port Royal (South Carolina). From there, they hoped to incite a slave insurrection to oust the English from the southern colonies. Given the high stakes, South Carolina's acting governor, William Bull, was remarkably unresponsive, allowing Oglethorpe and Georgia to bear the brunt of the English defense against the Spaniards.

In June 1743, Spanish troops under Gov. Manuel de Montiano invaded the Georgia coast at St. Simons Island, just 40 miles south of Savannah, the heart of the Georgia colony. Oglethorpe had gathered his forces and set his defenses, but his force was pitifully small without South Carolina's help. Outnumbered and quickly outflanked, Oglethorpe ordered his troops to abandon Fort St. Simons and retreat to Fort Frederica.

On July 7, 1743, the opposing forces met along the Military Road that connected the fort and the town in what became known as the Battle of Bloody Marsh. In this short engagement, Oglethorpe's combined army of English, Scottish Highlanders, and Native Americans ambushed the Spanish force of nearly twice its size. Using guerrilla tactics, Oglethorpe's men thoroughly routed the Spanish. The Spanish then withdrew back on St. Simons and sailed for Florida on July 14. Oglethorpe had thus repelled what turned out to be Spain's last attempt to expand northward from Florida.

In the wake of this Georgia military success, Oglethorpe received promotion to brigadier general. In July 1743, he traveled to England, under some criticism for his administration of the colony. In England in 1744, he met and married Elizabeth Wright. In 1745, he was advanced to major general and in 1765 to the rank of general. Meanwhile, he had been defeated in parliamentary elections in 1754. Oglethorpe settled in Essex in 1760. He died there at Cranham Hall on June 30, 1785.

Ogoula Tchetoka, Battle of

Event Date: March 25, 1736

French attack on the Chickasaw village of Ogoula Tchetoka on the lower Mississippi River (near present-day Memphis, Tennessee). As allies of the British, the Chickasaws were important in helping Britain gain supremacy over France in the southern part of North America. The nation's location on the Mississippi River and the stranglehold it imposed on French commerce and communication cut New France virtually in two, separating Louisiana from the rest of the colony. The Chickasaws had supported the Natchez when they revolted against the French in 1729, adding insult to France's grievances against the tribe and leading to the French decision to destroy the Chickasaws in the same manner as they had destroyed the Fox and the Natchez.

In the spring of 1736, two French forces set out against the Chickasaws. The northern one, under the command of the Illinois Territory's governor, Pierre d'Artaguette, included 30 French regulars, 100 militiamen, and almost 300 Illinois, Weas, Miamis, and Piankashaws led by the Illinois chief Chicagou and François de la Valterie, Sieur de Vincennes. The southern force included some 600 French troops and 1,000 Choctaw warriors commanded by Jean-Baptiste Le Moyne de Bienville. The original plan was for both armies to meet at the main Chickasaw town of Ackia (Tupelo, Mississippi) at the end of March.

Bienville's force, which followed the Tombigbee River north from Mobile, was delayed for several weeks by heavy rains, but Bienville had no means of informing d'Artaguette of his position. The northern force arrived at the Chickasaw Bluffs (Memphis) in early March as planned and built a small fort as a supply base. After three weeks, however, d'Artaguette was running out of food and decided to attack on his own. The Chickasaws were well aware of the presence of the French and were waiting in their fortified towns. Realizing that his force was not strong enough to defeat the Chickasaws in their main town of Ackia, d'Artaguette chose to attack Ogoula Tchetoka on March 25.

The village was heavily fortified, and the French and their allies were pinned down by crossfire. Worse yet, 400 Chickasaw warriors arrived from a nearby town and hit the French flank. Most of France's native allies fled the battlefield, joined by some of the French regulars. Seventeen Frenchmen were captured including d'Artaguette and Vincennes. When the Chickasaws realized that a second force was approaching from the south, they no longer hoped to ransom their captives and burned d'Artaguette and the others alive.

Learning of d'Artaguette's death when he approached Chickasaw territory, Bienville was determined to avenge him by attacking Ackia, which hosted Natchez refugees. The Chickasaws, however, had used the interval to fortify the town with the help of British traders. Nevertheless, as the French forces outnumbered the Chickasaw and Natchez defenders three to one, the Chickasaws sent a delegation of intermediaries to arrange for a truce, but the Choctaws killed them after their arrival.

The French employed grenades against the village's fortified houses and protected themselves with heavy woolen bags against musket balls, but the defenders caught them with crossfire between houses. Several French officers were killed, which added to the confusion among the soldiers. The French finally retreated, and Bienville led his diminished force back to Mobile. The Battle of Ogoula Tchetoka was the worst defeat the French had suffered to that point in their clashes with Native Americans.

Ohio Company

A land speculation company formed in July 1749 and officially dissolved in May 1771. The official name of the enterprise was the Ohio Company of Virginia. After hearing the company's petition for land in 1749, King George II sent instructions to Lt. Gov. William Gooch of Virginia directing Gooch to grant 200,000 acres to the company in the Ohio River Valley, which was within Virginia's extensive western land claims.

The company did not fulfill the obligations outlined in its charter, namely, to settle 100 families on its land grant, but it managed to capitalize on an expanding Native American trade network. By the end of 1749, company traders and agents had constructed a storage house on a western branch of the Potomac River. Within the next two years, the company had begun planning a road northwest

Woodcut of the Ohio Company coat of arms. The Ohio Company was a land speculation company formed in 1749. (The Granger Collection)

toward the Monongahela River. It also sought to purchase more land in western Maryland. Company representative Christopher Gist also began surveying Ohio Company land for larger-scale settlement.

The Ohio Company's attempts to advance its claims raised fears among natives in the region. In 1752, officials representing Virginia and the Ohio Company negotiated the Treaty of Logstown with the Iroquois, Shawnee, Delaware, and Wyandot nations. It required the natives to recognize Virginia's claims along the eastern Ohio River and the Ohio Company to build a fort near present-day Pittsburgh to protect the allied natives and white settlers. This provision brought the company and the colony of Virginia into direct confrontation with the French, who also claimed the area.

Shortly after company agents began building the fort in 1754, it was surrounded by an armed French force, which secured the surrender of the fort after a brief parley. This action set in motion the events that precipitated the French and Indian War.

Stockholders in the Ohio Company included members of some of the most prominent families in the colony, such as Augustine Washington, Thomas Lee, John Mercer, and Lt. Gov. Robert Dinwiddie. The company's most effective advocate was John Hanbury, a wealthy Quaker merchant in London. Hanbury had presented the Ohio Company's petition for the land grant to the king's Privy Council, leading to the 1749 grant.

After the French and Indian War, the Ohio Company met more obstacles to settlement. The company finally merged with another land company before the official expiration of its charter in 1771.

Ohio Country

A loosely defined area of territory west of the Appalachian Mountains and north of the Ohio River and a key battleground in the French and Indian War (1754–1763). The Ohio Country encompassed modern-day Ohio, eastern Indiana, southern Michigan, western Pennsylvania, and northwestern West Virginia.

Before the English and French settlements emerged between 1650 and 1700, the Iroquois considered the Ohio Country part of their territory. However, the Europeans ultimately forced the area's natives to confederate, move, or perish. Around 1660, hoping to dominate the fur trade, the Iroquois chased the Shawnees out of the region during the so-called Beaver Wars. By 1730, however, the Shawnees were back.

By the middle of the 18th century, French and English merchants in Ohio traded with the natives and came into increasing conflict with each other. Interested again in the fur trade, the Iroquois revived their land claim. They, the French, and the Shawnees (allied with the Delawares) fought the British.

George Washington and other wealthy Virginia planters sought to purchase large tracts of land in Ohio Country, subdivide these, and then sell smaller sections to settlers. They had less interest than the French in the fur trade. In 1749, the Ohio Company received a crown charter for 200,000 acres near the Forks of the Ohio River. The company sought to settle 100 families and build a fort there in order to strengthen British claims. In 1750, the company dispatched Christopher Gist into the Ohio Country to survey it in preparation for settlement.

The French soon learned of the Virginians' interests in the area. Having no intention of sharing the land, they established a string of forts, and the struggle for control of the Ohio Country was under way; indeed, it was the immediate cause of the French and Indian War. The conflict ended with the Treaty of Paris (1763), in which France ceded the area to the British.

The war thwarted the Ohio Company's plans. The company was also blocked by the Proclamation of 1763. London did not want the expense of garrisoning the area nor bloodshed, so it issued the Proclamation of 1763, which barred colonial settlement west of the

Appalachians. The colonials had fought the war in part because they wanted the fertile farmlands available in Ohio, and they saw the proclamation as a clear disregard on the part of the Crown of their needs and interests.

The restrictions on settler access to the Ohio Country were a contributing factor in the coming of the American Revolution. Other British actions dealing with Ohio further fanned the flames of colonial resentment. For instance, London ended the Crown's recognition of the colonies' land claims in the area. And the Quebec Act of 1774 placed the region under the newly acquired province of Quebec, making it French in governance and Catholic in religion.

Virginian and Pennsylvanian settlers seeking new land ignored the prohibitions and crossed the Alleghenies, coming into conflict with the Shawnees. Threatened by the westward expansion of English colonists, during the American Revolutionary War the Ottawas, the Wyandots, the Miamis, the Mingos, the Shawnees, and other natives joined the British to keep the settlers out. Although the French had ceded the Ohio Country, this action had not extinguished the Native Americans' claims.

During the American Revolutionary War, Patriot forces were successful in Ohio by 1778. The Virginia legislature organized the county of Illinois, covering Ohio lands that Virginia claimed. But the Native Americans were not done yet. In 1782 the Ohio Nations and the British bested the Americans at the Battle of Blue Licks. Under the terms of the 1783 Treaty of Paris, the Ohio Country was ceded to the United States and opened almost immediately to settlement. With the establishment of the Northwest Territory, which encompassed Ohio, colonial claims were extinguished. Claiming their wartime bonus, American veterans and land speculators flocked to the territory.

The Shawnees continued to resist, but by 1800 they had mostly given up their Ohio claims in exchange for land in Missouri. During the War of 1812, the Shawnee chief Tecumseh mounted the last effective Native American resistance. By 1817 it had been eliminated.

Ohio Expedition

Start Date: April 2, 1754 End Date: July 3, 1754

Failed British colonial campaign against the French in the Ohio River Valley that began on April 2, 1754, and ended with Lieutenant

Colonel George Washington's surrender at Fort Necessity (Pennsylvania) on July 3, 1754. The expedition followed Washington's failed attempt to negotiate a French withdrawal from the region in 1753. The results of the campaign set the stage for another expedition in 1755. That offensive formally began the Seven Years' War (French and Indian War) in North America.

Late in 1753, Washington, already commissioned a major in the Virginia Militia, marched to Fort Le Boeuf, some 25 miles southeast of Lake Erie. There he presented the French commandant, Captain Jacques Legardeur, with an order from Virginia's lieutenant governor, Robert Dinwiddie, calling on the French to evacuate the region. The directive also demanded that New France give up all territorial claims along the Ohio River and its tributaries. Legardeur rejected the demands, and Washington then returned to Williamsburg, Virginia, to report to Dinwiddie.

In the spring of 1754, after an extended debate with the Virginia House of Burgesses, Dinwiddie secured an appropriation to outfit a 200-man force under Washington's command to march into the Ohio Valley. Dinwiddie promoted Washington to lieutenant colonel. He also sent word to agents working for the Ohio Company of Virginia, a land speculation and trading enterprise, to begin recruiting a militia company in far western Virginia to assist with the defense of Virginia's land claims.

On April 2, 1754, Washington led a contingent of only 160 men from his supply base in Alexandria, Virginia. Once this force had crossed the Blue Ridge Mountains, they gathered more provisions at Winchester, Virginia. Because they had to widen the road as they traveled west from Winchester, progress was slow. On average the company covered only two to three miles a day. The only benefit to such slow progress was the possibility that other companies might have time to come to Washington's aid before his command reached the area contested by the French.

Washington advanced steadily toward the Forks of the Ohio River, near present-day Pittsburgh. On April 20, he received word that 41 Virginians under the command of English ensign Edward Ward had surrendered a new fortification to 600 French soldiers led by Captain Claude-Pierre Pécaudy de Contrecoeur, new commandant of Fort Le Boeuf (Pennsylvania). The surrender had been negotiated peacefully and Ward's men returned to Virginia. The French renamed the newly acquired fortification Fort Duquesne and continued its construction under the French flag.

Four days later, Washington stopped his troops at a marshy clearing known as Great Meadows. There he decided to build a fortification and await reinforcements. While his men constructed a crude stockade, scouts brought news that a small French force was close by. Washington sent out 75 men to reconnoiter the area and cut off the French force from the Monongahela River. Soon afterward, Tanaghrisson, a Mingo chief known as "Half-King" to his English allies, sent a message to Washington that he and a small group were camped near Great Meadows ready to attack the French party.

Late that night, Washington left half of his force in Great Meadows and marched with 47 men to join Tanaghrisson's party. At sunrise on May 28, 1754, Washington's men along with Tanaghrisson and several Mingo warriors surrounded and attacked the French encampment. More than 20 Frenchmen surrendered after a 15-minute battle that claimed 9 of their force. In the aftermath of the fighting, Washington lost control of the situation when Tanaghrisson approached the wounded French commander, Ensign Joseph Coulon de Villier de Jumonville, and killed him by cracking his skull with a tomahawk. After this turn of events, Washington sent the surviving prisoners under guard to Virginia and returned to Great Meadows to continue construction of the fortification there.

On June 2, Washington's post, Fort Necessity, was complete. It consisted of a circular palisade about seven feet high with an entrenchment on the outside to provide protection for soldiers unable to fit in the tiny fort. After Washington received reinforcements of about 300 men, he marched toward Fort Duquesne with a large portion of his force.

Along the march, scouts reported on June 28 that more than 700 French soldiers and native warriors were marching from Fort Duquesne. Washington considered his options and decided to fall back on Fort Necessity. When the men arrived there, they did their best to strengthen the palisade and waited for the French.

French forces attacked Fort Necessity on the morning of July 3. Washington marched his men out of Fort Necessity's stockade to confront the French in traditional battle formation. The French commander, however, kept his men within the tree line surrounding the fort and was able to pour musket fire into Washington's line. Washington then ordered a retreat into the fort and its surrounding trenches. There they faced continuous enemy fire for the next eight hours. With his men surrounded and many unable to fire their weapons because of rain, Washington asked, via an interpreter, to negotiate terms of surrender.

The French commander allowed Washington and his men to return to Virginia, marching under full colors and carrying several of their weapons. Because of a failure of translation, however, Washington unwittingly acknowledged that he was responsible for the murder of Jumonville a month before. This last point heightened tensions between England and France and was a factor in bringing the nations to full-scale war by the following year.

Ohio Expedition

Start Date: April 1755 End Date: July 1755

British campaign during April to July 1755 against the trans-Allegheny French position at Fort Duquesne at the Forks of the Ohio River during the French and Indian War (1754–1763). In the summer of 1754, colonial forces under the command of Lieutenant Colonel George Washington had failed to secure the Forks of the Ohio against French designs. The mission, in fact, ended in Washington's surrender of Fort Necessity.

With the beginning of the French and Indian War, British authorities were determined to make a concerted effort in 1755 to strike the French in North America. They planned an ambitious, multipronged attack. The British planned to send four separate expeditions against French strongholds at Fort Niagara, Fort St. Frédéric (Crown Point), Fort Beauséjour (New Brunswick), and Fort Duquesne. The latter was the primary objective of British strategy in 1755.

The French constructed Fort Duquesne in 1754. It soon became a significant threat to the backcountry settlements of Virginia, Maryland, and Pennsylvania. It also solidified French control over the upper Ohio Valley, a region much coveted by colonial land speculators.

In late 1754, London appointed Edward Braddock of the Coldstream Guards as major general and commander in chief of British forces in North America. He was selected for this posting despite having no significant experience commanding large forces on active campaigns. With wide-ranging authority to conduct operations and the power to coordinate logistical support with provincial leaders, Braddock decided to lead the expedition in person against Duquesne.

Military planners in London recognized that the colonies might not have sufficient troops to conduct the operations projected in 1755, particularly that against the French on the Ohio. Fort Duquesne was in territory disputed by Virginia and Pennsylvania, so neither colony could be counted on to raise a large number of troops for such a dubious mission. Squabbling within the various provinces between royal officials and parsimonious assemblies in 1754 also led to insufficient support for military affairs that year. Indeed, this would continue to be the case throughout Braddock's

tenure as commander in chief. Given the unlikelihood of sufficient matériel, provisions, and recruiting in America, Crown officials sent two foot regiments of 500 redcoats each from Cork, Ireland, to join Braddock's thrust toward the Ohio. They were Sir Peter Halkett's 44th Regiment and Colonel Thomas Dunbar's 48th Regiment, neither of which was regarded as a particularly effective unit. These regiments landed in Virginia in March 1755 at Alexandria, where Braddock had established his headquarters.

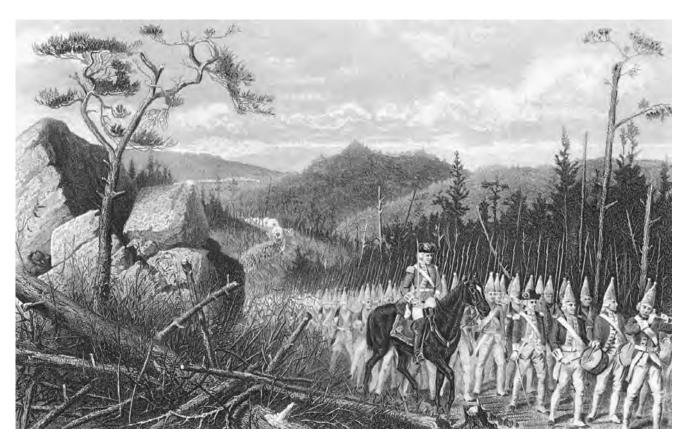

On his February 1755 arrival in America, Braddock faced enormous obstacles. He had to secure supplies, money, horses, wagons, and men. To obtain these, from the time of his arrival he continually harangued colonial leaders. Pennsylvania and Maryland were particularly parsimonious in granting aid to Braddock's forces. Pennsylvania's Benjamin Franklin, however, was eventually able to procure a number of wagons and limited additional support for the campaign from Pennsylvania.

British officers increased the strength of their regiments by enlisting Americans into their ranks, particularly in Virginia. Nevertheless, Braddock had to rely on other troops raised in the colonies to augment his forces. These included a small company of Virginia light horse, several companies of Virginia rangers, one company of Maryland rangers, one company of North Carolina rangers, two New York Independent Companies, a detachment of the South Carolina Independent Company, numerous carpenters, and a group of British sailors to move and operate the artillery.

After several weeks of preparations in Virginia, Braddock's army began its long westward march in early April 1755. To avoid congesting the poor and inadequate colonial roads, Braddock divided his forces for the movement to his forward base, Fort Cumberland on the Potomac at Wills Creek. The South Carolinians and part of the colonial troops marched through Fairfax County and Winchester, Virginia, while Dunbar's command proceeded along the Potomac on the Maryland side of the river. By May 10, 1755, the army was united and encamped at Fort Cumberland. Among those participating was George Washington, who served without military rank as a volunteer aide-de-camp on Braddock's staff.

Braddock's difficulties in waging a wilderness campaign with a large army far from the main supply base in Virginia was compounded by his failure to obtain effective assistance from native allies. Indeed, he alienated many natives and failed to comprehend the importance of warriors as scouts and guides for the march to the Ohio in a mountainous land of no roads and few trails. He refused to allow the native women to accompany the army as was customary. And he implied that once the French were defeated, the English would own the lands along the Ohio River. After several stormy meetings with Ohio Valley native delegations at Wills Creek, most of these valuable auxiliaries unceremoniously departed the fort. Braddock was left with only eight Mingo warriors under the Half-King Scarouady. Other natives, including the Delawares, remained neutral.

From Fort Cumberland, the French position at Fort Duquesne was approximately 110 miles west-northwest. Between the two lay

Etching depicting British major general Edward Braddock's ill-fated march on French Fort Duquesne in 1755. (North Wind Picture Archives)

several major mountains with torturous terrain. Ambush by the French and their natives allies was a constant threat. Not only were the British forced to carry with them all of their munitions, supplies, food, and fodder, but they had to cut a road in the forest to allow the troops, wagons, and artillery to move against the enemy. Additionally, countless swamps and creeks along the way required the construction of numerous bridges.

By the time Braddock's advance troops set out from Fort Cumberland on May 29, 1755 (followed by the rest of the army over the next several days), the army included 29 artillery pieces, over 400 wagons, 900 horses, and a large herd of livestock. For the most part, the army's engineers and pioneers constructed what became know as "Braddock's Road" by improving on ancient Buffalo paths or American Indian trails. Nevertheless, the going was so difficult that the army could often cover only two or three miles in a day. Meanwhile, enemy Native American parties occasionally harassed the column as it crawled westward.

One week after the British force left Fort Cumberland it had covered only 35 miles. On June 17, Braddock decided to divide his army into a quick-moving "flying column" of 1,500 picked men and lighter cannon. They were to be followed by a second column of troops and the baggage and the remainder of the artillery commanded by Dunbar. The lead troops made much better progress from that point, and a week later they crossed the Youghiogheney

River. After that, the troops began to encounter increased signs of hostile warriors in the surrounding woods.

By June 27, Braddock had successfully crossed the last of the several mountain ridges on the way to the Forks of the Ohio. But he faced dwindling supplies, and much of the army's flour was ruined by heavy rain. The army nonetheless pressed on in the face of increased skirmishing with natives and the continuous need to construct the road. By July 8, the army stopped on the east bank of the Monongahela River, just eight miles from Fort Duquesne.

The French were not unaware of Braddock's progress. They assembled a force of 250 regulars and Canadian militiamen commanded by Captain Claude-Pierre Pécaudy, Seigneur de Contrecoeur, along with 637 warriors—mostly Ottawas, Mississaugas, Wyandots, and Potawatomis. When the British began to make their final crossing of the Monongahela on the morning of July 9, Contrecoeur sent much of his force out to meet the enemy. He opined that his native allies were not likely to participate in defending the fort from within its walls.

Braddock's men crossed the river without incident. However, French and natives ambushed them shortly thereafter. What ensued became a confused melee in which panicked British regulars were routed by their largely unseen enemy. Braddock was mortally wounded. His decimated army then fell back on Dunbar's support column in a disorganized retreat to the Great Meadows, a

camp along their original line of advance. Dunbar restored order among the troops and marched the survivors back to Fort Cumberland to regroup. Rather than remain at this relatively secure post, however, he marched all of his regulars to Philadelphia for winter quarters in July, leaving the frontier of Virginia and Pennsylvania wide open to the depredations of the French-supported natives.

Ohio Expedition

Event Date: 1764

Campaign orchestrated in the fall of 1764 by British colonel Henry Bouquet, designed to compel Native American insurgents to sue for peace. The 1764 Ohio expedition was a "mop-up" operation carried over from the French and Indian War (1754–1763) and Pontiac's Rebellion, begun in 1763. In concert with a northern force led by Colonel John Bradstreet, Bouquet was to attack Delaware, Mingo, and Shawnee villages that had taken part in the insurrection.

Bradstreet's contingent did not complete all of its assigned duties, however. This left Bouquet's force to face the region's American Indian war parties alone. Delays raising colonial forces and adequate supplies to equip 1,200 troops under Bouquet's command slowed offensive preparations. The final preparations were not completed until the late summer.

Colonial legislators were reluctant to provide manpower for this combined effort. The Pennsylvania Assembly agreed to provide 1,000 men, but many of them deserted before reaching the operational theater. Consequently, regulars drawn from the 42nd (Royal Highland) Regiment of Foot and the 60th (Royal American) Regiment of Foot did not take the field with provincial counterparts from Pennsylvania and Virginia until October 1. On that date, the expedition began its slow advance from Fort Pitt toward the upper Muskingum River Valley.

Bouquet's command of irregular warfare was demonstrated during the 130-mile march through the wilderness to a fortified encampment constructed deep in the heart of native territory. His late start was not a detriment because offensive operations were most effective after autumn frost had denuded vegetation that provided natural cover for ambushes. The soldiers moved at a guarded

Shawnee, Delaware, and Mingo representatives make peace with the English, relinquishing their captives to Colonel Henry Bouquet in November 1764. Bouquet led an expedition into the Ohio River area to restore peace following the French and Indian War and Pontiac's Rebellion. (Library of Congress)

pace along three parallel paths cut by pioneers, much like they had during Forbes's march on Fort Duquesne in 1758. Bouquet had been de facto field commander of that campaign and had then learned the basics of North American frontier warfare.

Bouquet's tactical thinking had evolved somewhat in the intervening six years, however. His infantrymen now adopted a novel configuration based on the hollow square used to defend against cavalry attack. In this instance, they were to deploy into a defensive shell instead of an extended line when fired on. Regulars formed the front and right of the square, Pennsylvanians composed the left and rear of the square, and 50 light horses and Virginia volunteers provided the rear guard. The center was reserved for the baggage train, moving down the middle lane ahead of troops, who would close the square behind the 300 or so drovers and camp followers. Such innovation protected both the troops and the vulnerable pack horses from surprise.

The approach of Bouquet's force alarmed natives who realized their untenable position and hurried to the negotiating table. Delaware messengers were the first to treat since their Detroit confederates had already reconciled with the British months before. Mingo and Shawnee representatives appeared shortly thereafter. The Royal American commander displayed his diplomatic skills by receiving native emissaries gallantly but without affection to emphasize the solemnity of the occasion.

The ensuing conference held at Tuscarawas met on October 17, 1764, in a special arbor built some distance away from the lines. There an honor guard of light horse, regulars, and provincials were posted to impress arriving dignitaries with the strength of the forces marshaled against them.

Bouquet censured native chiefs for breaking the peace, killing innocent civilians, and besieging Fort Pitt. Old native refrains that warriors had been compelled to participate in the insurrection or that braves still raiding backcountry settlements were beyond the control of community headmen fell on deaf ears. Bouquet assured his listeners that a new armistice would not be signed until every previous treaty obligation was honored by their communities. In particular, he stipulated that all British captives, including slaves and deserters, must be returned to the colonies. Villagers were required to provide provisions and transport for this exodus. Bouquet also insisted that all war parties were to be recalled and appropriate tribal deputies sent to Sir William Johnson, Superintendent of Indian Affairs for the northern colonies, to make peace. A grace period of 12 days allowed prisoners to be collected from distant villages at the Muskingum Forks, where the army marched to receive them.

Bouquet then advanced another 30 miles into the very heart of Shawnee territory and built an entrenched camp. Meanwhile, he awaited delivery of the prisoners. Native raiders had captured approximately 2,000 colonists through 1764, with many still awaiting redemption by the fall of that year. Shawnee communities held the largest number of Anglo-Americans taken during the French and Indian War and Pontiac's Rebellion. And they had exhibited remarkable unwillingness to release them, despite repeated promises to do so. Only the intimidating presence of Bouquet's troops overcame their recalcitrance. It also prompted the release of many captives and the surrender of 6 hostages as surety for the delivery of the balance soon after. Two hundred and seven captives were initially taken into army custody and housed in special accommodations constructed within British lines.

Lists of captives recording their names, ages, dates and places of capture, as well as physical descriptions, were compiled before they were discharged into the care of custodians who accompanied them eastward to Pittsburgh. From there, they were returned to their counties of origin where anxious relatives awaited. Nine more Shawnee prisoners were released to authorities within weeks of the first group's arrival at Fort Pitt on November 28, 1764.

Pennsylvania legislators, in a rare moment of equanimity, offered public thanks to Bouquet for restoring tranquility to their western frontiers. It was a peace that would last until the outbreak of Lord Dunmore's War a decade later. Their address recognized the Royal American officer's expertise in partisan warfare, citing his actions at Bushy Run and the Muskingum Valley expedition as concrete evidence of military prowess.

Ohio River Valley

Valley of the Ohio River, the tributaries of which drain the entire western slope of the Appalachian Mountains south of New York. The Ohio River begins at present-day Pittsburgh in southwestern Pennsylvania, at the confluence of the Allegheny River and the Monongahela River. After initially flowing northwest, the river proceeds southwest at the border of the present states of Ohio and Pennsylvania. From there it follows a series of sweeping arcs to the south and southwest, joining the Mississippi River where Kentucky, Illinois, and Missouri meet. The river is 981 miles long and contributes almost half of the water volume of the Mississippi River.

For the first 300 to 350 miles, the Ohio River flows through sharply hilly country, the western foothills of the Appalachian Mountains. As it reaches Kentucky and western Ohio, the land opens up onto extremely fertile and gently rolling plains. The river is easily navigable during all seasons, save for a stretch of rapids about halfway down its length, known as the Falls of the Ohio.

During the colonial period, virtually the entire watershed was heavily wooded. However, early American explorers to the region recognized the farming potential of the land, particularly in Kentucky, located south of the river. There were four areas of white settlement in the valley. Perhaps 500 Pennsylvanians and Virginians lived around Fort Pitt (modern-day Pittsburgh), in what is now southwestern Pennsylvania. Several small settlements of Moravian Germans and their Christian Delaware converts began settlements about 200 miles downstream, in what is now West Virginia. A few hundred additional Virginians lived in Kentucky. Several hundred Frenchmen lived in southern Illinois, north of the river. The Ohio Valley was also home to several Native American nations, including the Shawnees and the Cherokees. In addition, the Iroquois claimed the regions to the north and east of the river.

Given the heavily forested nature of the land, and the complete lack of roads, the river system was the only practical way of conducting any large-scale military campaign. The valley was the scene of sporadic fighting in the colonial period and Anglo-French disputes over its control sparked the French and Indian

War (1754–1763). The area became the site of numerous skirmishes during the American Revolutionary War. During that struggle, Patriot control of Fort Pitt and the regions in Kentucky gave them a decisive advantage over the British and their Native American allies.

Ojibwa-Dakota Conflict

It is not possible to ascertain for certain when the Ojibwa (also called Anishinabe or Chippewa) and Dakota (Sioux) peoples began to war against each another. The origins of the conflict, according to Ojibwa accounts (recorded by William Warren), date back to pre–European contact times. Forced westward because of their conflicts with the Iroquois, the Ojibwas moved into the territory west of the Great Lakes. Many of the native peoples in the region, including the Dakotas, regarded the Ojibwas as intruders. The origins of the Dakota-Ojibwa wars are also usually attributed to treachery on the part of one side or the other. The fighting lasted from precontact times into the mid-19th century.

The Ojibwa-Dakota conflict, however, would take on a very different aspect with the arrival of Europeans. By the end of the 17th century, native peoples of the Great Lakes and beyond had

discovered the advantages of European tools and weapons. And they realized that possessing them gave them an advantage over their enemies. Even before they encountered Europeans, the Dakotas sensed the value of metal trade goods.

The arrival of French traders in the 17th century introduced a new and deadlier aspect to the Ojibwa-Dakota conflicts. Having easier access to French traders because of their location, the Ojibwas obtained firearms earlier than the Dakotas. Thus, they were able to gain, and for the most part keep, the advantage in the conflict. Concerned with the ruinous effects of warfare on the fur trade, French traders—and their later British and American counterparts—did their best to arrange truces between the two sides. Traders realized they were in a delicate situation. Trading with one side in the conflict could bring an attack by the other.

By the mid-18th century, the main battleground between the two sides was the area of present-day Minnesota. Not only were furs and fur hunting territories at stake, but also the abundant waterways of the region with large quantities of wild rice, which was the staple food of both peoples. Another primary objective of both the Ojibwas and the Dakotas was not only the traditional goals of honor and captives, but to keep the other side from trading with the French and acquiring European weaponry.

With the beginning of the 19th century, the Ojibwas had succeeded in pushing the Dakotas and their allies, the Cheyennes, out of most of the Minnesota Territory. The conflict between the two would continue into the 1850s, and some Dakotas remained in Minnesota until the 1860s, when they departed to join their brethren on the Great Plains, becoming part of the Plains horse culture.

Ojibwas

Native American nation of the upper Great Lakes region. At the time of first European contact, the Ojibwa (also called Anishinabe or Chippewa) peoples constituted the largest Native American group in the Great Lakes region. Their population was estimated at some 35,000. Located in present-day Ontario, Michigan, Wisconsin, Manitoba, and Minnesota, the Ojibwas lived in widely separated groups.

In spite of their large numbers, the Ojibwas did not wield the same amount of influence with the Europeans as did the Iroquois. Their location, far from the theaters of imperial conflicts, helped to limit their involvement in these wars. The Ojibwas were, nevertheless, one of the few native peoples to turn back the Iroquois onslaught during

the Beaver Wars. They fought the Dakotas for over 150 years, eventually pushing them into the Great Plains. The Ojibwas allied themselves with the French during the French and Indian War (1754–1763), and they also participated in Pontiac's Rebellion (1763).

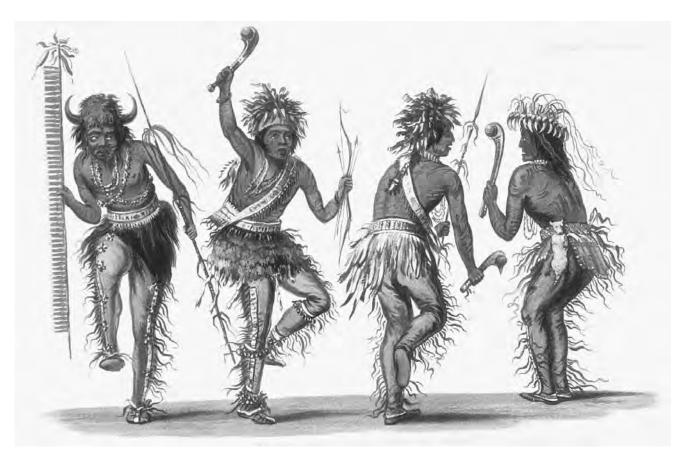

According to their oral traditions, the Ojibwas migrated to the Great Lakes region prior to European contact after being driven from the eastern seaboard by their Iroquois enemies. They settled in the vicinity of Lake Superior as well as in lower Michigan. Native peoples of the region, such as the Munduas, regarded them as interlopers and responded forcefully to their presence, but the Ojibwas defeated these opponents in short order.

The Beaver Wars commenced in 1641, when the Iroquois Confederacy, heavily dependent on European goods, trapped out the beaver in their territory. Provided with firearms by the Dutch, the Iroquois launched attacks against other native peoples in Ontario. During the next few years, they proceeded west, defeating other American Indians along the way. However, the Iroquois could not defeat the Ojibwas, who, by the 1690s, had also secured firearms from French traders. In a series of battles in northern Michigan and northern and southern Ontario, the Ojibwas turned back the Iroquois. Shortly thereafter, exhausted from the Beaver Wars, the Iroquois sought peace with New France.

Because of their distant location, the Ojibwas avoided fighting in the first three imperial wars between England and France. With the outbreak of the French and Indian War in 1754, however, the French needed their native allies more than ever. The French managed to convince a large number of Ojibwa warriors to go east and fight with them. These Ojibwas participated in the defeat of a British force under Major General Edward Braddock in 1755, almost within sight of Fort Duquesne. In 1756, Ojibwas also served as auxiliaries to French major general Louis-Joseph, Marquis de Montcalm's, forces during his assault on the English fort at Oswego on the shores of Lake Ontario. Ojibwas also joined Montcalm's attacks in 1757 on Fort William Henry and Fort Edward on Lake Champlain and Lake George. Before the end of the war, however, the Ojibwa warriors, like most of France's other native allies, had returned to their homes.

The peace terms that ended the French and Indian War in 1763 dictated that the French surrender all of their North American possessions. At that time, Major General Jeffery Amherst, British commander of forces in North America, ignored the advice of the British Indian superintendent, Sir William Johnson, and ended the practice of giving gifts to native peoples. Amherst argued that the giving of gifts amounted to bribing people for good behavior. The gifts, which included items such as powder and shot for hunting, however, had become necessities for the Ojibwa people.

The natives disdained what they saw as British arrogance, and it was at about this time, in the Ohio Country, that Neolin (also known as the Delaware Prophet) began preaching a message urging native peoples to give up European goods—particularly alcohol—and to return to the ways of their ancestors. Ottawa chief Pontiac (whose mother was an Ojibwa) found Neolin's message especially appealing. Pontiac, however, may have altered Neolin's

Ojibwa Native American war dance. A large nation within the Algonquian linguistic family, the Ojibwas were centered in the upper Great Lakes region. (Hulton-Deutsch Collection/Corbis)

message. Neolin preached avoidance of Europeans, but Pontiac argued that Neolin made an exception for the French, whom Pontiac hoped could be persuaded to return. French residents encouraged Pontiac in this belief. Thus, he organized a number of native nations in the Great Lakes region and the Ohio Country into an alliance against the British and struck in 1763.

Pontiac's forces quickly captured all of the British posts in the west with the exceptions of three forts: Detroit, Niagara, and Pitt. Ojibwa warriors participated in a number of battles during what the English called Pontiac's Rebellion. The most important one for the Ojibwas occurred on June 2, 1763, at the British post of Fort Michilimackinac on Mackinac Island in the Straits of Mackinac, which separate Lake Michigan and Lake Huron. Its garrison was unaware of the uprising and did not know about Pontiac's attacks on other British forts. The Ojibwas arrived at the fort and began playing a game of lacrosse outside its walls. The garrison looked on, with the gates to the post left open. During the game, the ball was lofted over the wall into the fort, and the players took off after it. They rushed through the gates while their women handed them weapons they had concealed underneath their blankets. Seizing the fort, the Ojibwas killed 15 of the post's 35-man garrison and took the remainder prisoner. By the end of 1763, however, Pontiac's Rebellion had ended.

The longest conflict in which Ojibwas were engaged was their war with the Dakota people. The Ojibwa and Dakota peoples warred on one another in precontact times, and after European contact, fur traders, fearing that the trade would be harmed, often tried to arrange truces between the two sides. Although both sides fought for honor and captives, they were also fighting for control of the woodlands of present-day Minnesota, coveting its plentiful furs and lake regions containing wild rice. They also sought to deny European goods to their enemies. By the beginning of the 19th century, the Ojibwas had succeeded in pushing the Dakotas, and their allies, the Cheyennes, out of most of the Minnesota Territory. The conflict between the two nonetheless continued into the 1850s, and some Dakotas would remain in Minnesota until the 1860s.

Old Briton (Memeskia)

Born: Unknown Died: 1752

A Miami sachem (chief) who forged ties first with the French, then with the British in the vicinity of western Ohio. Nothing is known of the date and circumstances of birth for Old Briton (Memeskia), nor of his early years. Initially, Memeskia backed the French during the early stages of King George's War (1744–1748). By 1747, however, a shortage of trade goods and dwindling French gifts had badly strained the Miami-French relationship. This led Memeskia and the Miamis to join an unsuccessful rebellion against the French led by the Wyandot sachem Orontony.

Following the war, Memeskia formed an alliance with the British and allowed English traders to move into the new village of Pickawillany in western Ohio. To underscore his transfer of loyalty, Memeskia was thereafter known by the nickname of "Old Briton," instead of the French moniker of "La Demoiselle."

Pickawillany flourished as a major economic center, channeling to the British the trade of numerous native nations from as far away as Illinois. The French had claimed possession of Pickawillany and its surrounding countryside, but they felt powerless to counter the British presence because of their increasingly weak hold on the entire Great Lakes region. French officials tried without success to pressure Old Briton into expelling the English.

In early 1752, the French finally organized a military expedition of 250 Ottawa and Ojibwa warriors under the command of Charles Langlade, a leader of mixed French and Native American heritage. On June 21, 1752, the numerically superior French-led force overwhelmed and destroyed Pickawillany. In the process, Old Briton was taken captive. To foster a proper fear of French power, Langlade executed Old Briton. He then handed over the body to be cooked and eaten by the Ottawas.

The Miamis returned to their alliance with the French in 1753, a temporary accommodation that lasted only until the British permanently drove the French out of the region during the French and Indian War (1754–1763).

Old Fort Niagara (New York)

See Fort Conti (New York)

Old Shawnee Town (Ohio)

A Shawnee settlement located on the Ohio River at the mouth of the Scioto River, in present-day Scioto County, near Portsmouth, Ohio. Old Shawnee Town's nucleus was the council house, described by Christopher Gist in 1751 as a bark-covered structure about 90 feet long. This structure would have been used for council meetings, rituals, secular celebrations, the seclusion of warriors after a raid, or occasionally as a fort. Gist stated that the town had 140 bark lodges and 300 men, suggesting a total population of about 1,200, unusually large for a Shawnee settlement.

The village was established sometime before 1739 and destroyed by a flood in 1753. One of two Shawnee chief towns, or capitals, it was also known as Lower Shawnee Town or Lowertown. The French called it Sonnioto or Sonnontio. In addition, any Shawnee chief town could be called "Chillicothe." Some of these same names were used at different times for other villages or for the same villages moved to new locations.

An example of what the French called an "Indian Republic," the town was an ethnically mixed community of refugee peoples (Mingos, Delawares, and some Miamis, in addition to Shawnees), not controlled by a European alliance system, though nominally linked to the Iroquois-English Covenant Chain. Having been expelled from the Ohio Country by the Iroquois in the mid-17th century, the Shawnees began returning in the 1730s. In this they were encouraged by the French, who hoped to incorporate them into their alliance system. Although the Shawnees came to the area in part to use the French as an alternative source of trade goods, English traders followed them there as well. And the town was visited regularly by Susquehanna and Potomac traders. Moreover, Shawnee efforts to establish peace among the natives without French mediation vexed the French greatly.

Captain Pierre-Joseph Céloron de Blainville was met with suspicion and hostility at the town when he came to assert France's claim to the Ohio Country in 1749. He ordered the English traders out, stating that they had no right to be on the territory. At Old Shawnee Town, Céloron received word that the Detroit-based natives would not be reinforcing his expedition as promised. He then decided to withdraw without pillaging the English traders' goods, as he had been instructed to do.

In August 1752, following the destruction of Pickawillany by French-allied natives, the Miamis, the Mingos, the Delawares, and the Shawnees of the Ohio Valley met at Old Shawnee Town and called on the English and the Iroquois for support under the Covenant Chain. None was forthcoming. Viewing themselves as abandoned, the Shawnees shifted their allegiance to the French until the fall of Fort Duquesne in 1758.

Oñate, Juan de

Born: ca. 1552 Died: 1626

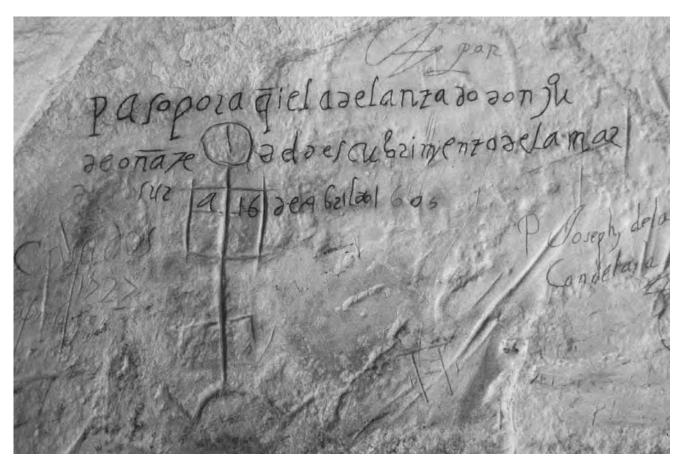

Spanish explorer and the first governor of the province of New Mexico. Juan de Oñate was born around 1552 in Nueva Galicia (New Galicia), located in western Mexico. His father, Cristóbal de Oñate, was a wealthy mine owner and the governor of New Galicia. As a young man, Oñate participated in the campaigns against the Chichimec natives along the northern frontier and helped administer the family silver mines in Zacatecas, the largest silver mining

site in northern Mexico. He married Isabel de Tolosa Cortés Moctezuma, the great granddaughter of the Aztec ruler Moctezuma (Montezuma) and granddaughter of Hernán Cortés. The combined wealth of these two families made Juan de Oñate one of the wealthiest men in Mexico.

In 1595, Oñate received an appointment from the Spanish court to lead an expedition up the Rio Grande River to spread the Catholic faith, pacify the natives, and establish a permanent colony in the northern reaches of New Spain. After a series of delays, Oñate and 500 men, women, and children entered New Mexico in early 1598 near present-day El Paso, Texas. The explorer immediately claimed possession of the land and its people.

By late May 1598, the expedition reached the upper Rio Grande and encountered the first of many pueblos that Oñate formally claimed for Spain. In July, Oñate arrived at the confluence of the Chama River and the Rio Grande and established his headquarters at Ohke Pueblo, which he renamed San Juan, the capital of the new colony. In doing so, Oñate effectively extended the Camino Real another 600 miles.

From San Juan, Oñate inaugurated his missionary program by dispersing friars to the pueblos while he personally conducted a reconnaissance of the province. Native hospitality turned to open

Inscription carved at El Morro by Gov. Juan de Oñate in 1605. It reads "Passed by here, the advanced Don Juan de Oñate, from the discovery of the Sea of the South, the 16th day of April, 1605." (National Park Service)

resistance in January 1599, when natives at Acoma Pueblo attacked Spanish soldiers who had entered the pueblo in search of food. Eleven Spanish soldiers died. In retaliation, Oñate sent a punitive expedition against the town that killed 800 men, women, and children and took another 580 captive. Adolescents were sentenced to 20 years of servitude, and adult men were subjected to public mutilation to be conducted in the plazas of pueblos along the Rio Grande as a lesson to those who might question Spanish authority.

In 1601, Oñate moved the capital across the Rio Grande to Yunque Ouinge Pueblo and renamed it San Gabriel. Despairing over the apparent lack of riches in the colony, Oñate set out in June of that year in hopes of finding wealth in Quivira—a location (most likely Wichita villages) in present-day Kansas visited by Francisco Vásquez de Coronado in 1541. The journey proved fruitless, and Oñate returned to his colony only to lead a final and equally unrewarding expedition in 1604 westward to the Colorado River and the Gulf of California. During his absence, growing discontentment in the colony led many Spaniards to return to Mexico.

With Spanish interests in New Mexico on the verge of failure, government officials recalled Oñate to Mexico City in 1606 to face charges related to the poor condition of the colony and the governor's conduct toward the Acoma natives. Oñate resigned his office in 1607 but remained in New Mexico long enough to see the establishment of a new provincial capital at Santa Fe. In Mexico City, the Spanish Court found the former governor guilty of misconduct toward the inhabitants (Spanish and native) of his colony and permanently banished Oñate from New Mexico. Despite a successful appeal clearing him of all charges, Oñate departed Mexico for Spain where he became a mining inspector. He died there sometime in 1626.

Oneidas

One of the five original tribal nations of the Iroquois Confederation. The Iroquois called themselves *Haudenosaunee*, or "People of the Longhouse." The name Oneida was derived from the Iroquois word *onayotekaona*, which referred to a great boulder that was located in their territory. The Oneidas joined with the Senecas, the Cayugas, the Onondagas, and the Mohawks to form the Iroquois Confederation. Around 1570, the prophet Deganawidah and his disciple Hiawatha founded the confederation with the goal of ending constant intertribal warfare.

The Oneidas' territory was in what is now central New York state. They lived near Lake Oneida southward to the Susquehanna River. To their immediate east were the Mohawks, and to their immediate west were the Onondagas. Although part of the Iroquois Confederation, the Oneidas were distinct from their fellow allied natives. They were also the least numerous of the Iroquois, numbering just 1,500 at first European contact.

The Oneidas shared the general culture and history of all the Northeastern indigenous peoples, and the Iroquois in particular. They built palisades to surround their villages and lived as families in longhouses in arrangements according to matrilineal descent. The women raised corn, tobacco, beans, and squash, and the men hunted and fished. Women were socially honored and held in generally high regard. The Oneidas believed that the world had been created when a woman fell from the sky world. The water creatures were concerned for her, so they built the land to be a platform for the woman, who was mother earth. This myth and many others were part of the rich spiritual lore of the Oneida people.

In the mid-1600s, the Oneidas made a temporary peace with the French while they played the Mohawks and the Onondagas against each other to preserve their independence. King William's War wrought great destruction on the Oneidas, and in 1696 French forces raided a key Oneida village and destroyed its structures and surrounding fields. This led to the division of the Oneidas into the Upper Oneidas and the Canawarogheres. Finally, in 1701, the Iroquois Confederation—including the Oneidas—made peace with the French and allied western natives. In 1722, the Tuscaroras, an Iroquoian-speaking band of natives from North Carolina, moved to New York. They sought protection from the Iroquois and were given a place next to the Oneidas to live. The Tuscaroras soon became the sixth nation of the confederation. For sometime thereafter, the Oneidas sent war parties into North Carolina to punish the Tuscaroras' enemies.

The Iroquois Confederation held an annual Great Council in Onondaga territory. Nine sachems, or chiefs, would attend as representatives of the Oneidas. The Oneidas were organized into three clans: the Bear, the Turtle, and the Wolf. Each clan was represented by three sachems nominated by the women of their respective clans. These sachems after 1722 also served as representatives for the Tuscaroras.

In general, the Oneidas tried to remain neutral in the various colonial conflicts. Nevertheless, their locale helped them to develop strong economic ties to the English, particularly in the Hudson River Valley. They courted natives in the Great Lakes but frequently warred with southern native groups. In this way, the Oneidas—and all of the Iroquois Confederation—could achieve maximum economic and military benefits from their allies.

During the American Revolutionary War, the Oneidas broke with the other Iroquois and supported the Americans against the British. They had tried to remain neutral so that they could avoid attacking the Tories, who were their neighbors. Eventually, Rev. Samuel Kirkland, a Presbyterian minister, brought most of the Oneidas over to the Patriot cause. Some Oneidas served as scouts for the colonists, and others served in different ways. During the

desperate winter at Valley Forge, a party of Oneidas led by Chief Skenadoah brought 600 bushels of corn to General George Washington's starving army.

Oneidas participated in several major battles of the Revolutionary War. On August 6, 1777, they fought in the Battle of Oriskany. After the American Revolutionary War, some Oneidas returned to their homes in central New York. At this time they took in some of the remnants of the Mohegans. Other Oneidas moved to a reservation on the Thames River in Ontario, Canada. In the early 1800s, most of the New York Oneidas relocated to Green Bay, Wisconsin.

Onondagas

Founding nation of the Iroquois Confederation. The Onondagas ("People of the Hills") controlled the heart of Iroquois territory in much of present-day upstate New York. They were hunters as well as agriculturalists, and their hunting territory ranged from modernday Onondaga County as far north as Lake Ontario and as far south as the Chenango Forks. As the most centrally located of the original Iroquois Five Nations (the others were the Senecas, the Oneidas, the Cayugas, and the Mohawks), the Onondagas hosted its yearly councils beneath the Tree of the Great Peace. They also provided the chief

who presided over these gatherings. This pivotal position rendered Onondaga political sentiments most crucial to how the confederation aligned itself with respect to European powers.

The Onondagas acted as mediators of sorts in deliberations at the annual councils. If the elder "house" or brotherhood of the Senecas and the Mohawks could not agree with its junior counterparts among the Cayugas, the Oneidas, and later the Tuscaroras, then the Onondagas supplied the deciding vote. But they had no veto power in the event that the other native nations presented a united front. The Onondagas also served as archivists for the confederation by maintaining its wampum belts and consequently sported the most chieftainships within the league. Their council house was one of the largest and most elaborate Native American structures of its time.

According to an Iroquois legend known as the Deganawidah (the Peacemaker) Epic, the peoples of the Five Nations warred frequently on one another until Hiawatha and Deganawidah promoted reconciliation. But an Onondaga chief and sorcerer, Tadadaho, rejected this message of peace and, in his resultant madness, grew misshapen with a bed of snakes for hair. Hiawatha and Deganawidah subsequently cured Tadadaho with wampum beads, which symbolically spurred the creation of the Great League of Peace and Power. This alliance, which dated at least as far back as the 16th century, emphasized internal stability and asserted authority over weaker native nations.

The Onondagas participated in the Beaver Wars (1641–1701). During this period they warred with western nations such as the Hurons and the Eries over hunting rights and access to trade with Europeans and other native groups.

Periodically relocating for better access to natural resources, the Onondagas generally confined themselves to inhabiting two large, fortified villages at a time. They employed fire to clear land for agriculture and forest underbrush for hunting. As with the rest of the league, they relied on adopting members of defeated nations to replenish their numbers. Some captives suffered ritualistic torture and execution as a means of grieving for lost loved ones. The Hurons (allied with the French) and the Susquehannocks comprised the principal indigenous enemies of the Onondagas.

During the 17th and 18th centuries, Protestants and Catholics proselytized among the Onondagas with limited success. The Jesuits established missions that proved short lived because of dramatic shifts in support for the French.

The Onondagas became factionalized through scheming among anglophiles, francophiles, and neutralists. This constant intrigue influenced the diplomacy of the confederation and threatened to draw it into larger conflicts. Although neutral at first, by 1759 most Iroquois were supporting the British during the French and Indian War (1754–1763). The demise of New France in 1763 left the Six Nations (with the addition of the Tuscaroras in 1722) without its former position as the arbiter of the balance of power in North America.

In the Proclamation of 1763, King George III established a limit for westward migration by American colonists. Settlers largely ignored the rule that prohibited expansion beyond the Appalachian Mountains, and Onondaga land holdings came under increased pressure. The Treaty of Fort Stanwix (1768) reconfirmed the Great Covenant Chain through which the Iroquois dissuaded subsidiary tribes from attacking colonists. With the American Revolutionary War underway in 1776, both sides courted the league for an alliance. The Great Council opted to let each of the Six Nations decide for itself. The Senecas, the Mohawks, and the Cayugas joined the British, and the Oneidas and the Tuscaroras assisted the United States. Accounts vary as to where a majority of the Onondagas stood on this question, but Patriot authorities regarded them as hostile.

Pro-British Iroquois conducted raids alongside Loyalist Rangers in New York and in Pennsylvania. An American offensive in 1779 destroyed the Onondaga villages. The British loss of the 13 colonies spelled disaster for the Iroquois Confederation as it was forced to cede most of its land in the Treaty of Paris (1783). The Onondagas then split between those who remained in New York and those who followed the Mohawk chief Joseph Brant to Canada.

Opechancanough

Born: 1575 Died: 1646

Influential Native American leader and Pamunkey chieftain (1622–1644) in Virginia's Chesapeake region at the time of the establishment of the Jamestown settlement in 1607. Opechancanough was sometimes referred to as the "King of the Pamunkeys," a name given to him by Jamestown leader Captain John Smith. Opechancanough was born sometime in 1575, probably in the eastern part of modern-day Virginia. Nothing is known of his early life, but Opechancanough's half-brother was the powerful Chief Powhatan, the leader of a confederacy of local natives. In 1617, Powhatan migrated north toward the Potomac River, leaving his half-brother in charge of the Chesapeake region. When Powhatan died in 1619, Opechancanough succeeded him as the werowance (chieftain) of the native confederation.

Unlike Powhatan, Opechancanough took a dim view of the English settlers. He viewed them as interlopers who had to be driven away or destroyed. In March 1622, he staged a daring attack against English settlements around Jamestown. Only weeks before, Opechancanough had given English leaders the impression that he stood for peace and tranquility. Thus, the settlers had little reason to defend themselves against a potential raid. In any event, Opechancanough's offensive killed 347 colonists or some 25 percent of the English population.

The stunned but furious survivors sought a hasty retribution. Although Opechancanough escaped capture, a large number of his subjects fell to blistering attacks and starvation at the hands of the English. Within a year, Opechancanough sued for peace. In 1644, a frail and failing Opechancanough authorized yet another broad offensive against the English settlements, allegedly to avenge the murder of a Pamunkey leader. His decision launched the two-year Third Anglo-Powhatan War (1644–1646) in which roughly 500 of Virginia's 8,000 white inhabitants died. The natives, however, again suffered disproportionately. In 1645, Virginians managed to track Opechancanough down and took him captive. He died in 1646 in Jamestown, murdered by a militiaman.

Orontony (Nicholas)

Born: Unknown Died: 1750

Wyandot-Huron leader in the Ohio River Valley noted for his consistent hostility toward the French. Nothing is known surrounding the circumstances of Orontony's birth or formative years. In 1738, Orontony (sometimes referred to as Orontondi, Rondoenie, Wanduny, or Nicholas) helped the British-allied Cherokees ambush a Detroit war party. This action earned him the enmity of French-allied natives, including some other Wyandots. Soon afterward, he and his followers left the Detroit region and founded a new settlement near Sandusky Bay. The site was within easy reach of British merchants and their lower-priced trade goods.

When King George's War (1744–1748) began, most Wyandots rallied to support the French. Orontony's group, however, instead strengthened its relationship with the British. Orotony entered into an alliance treaty with them in 1745 and allowed Pennsylvania

traders to build a strong blockhouse near his village. A wartime British blockade of Canada soon cut the flow both of gifts and of French trade goods. This development greatly disrupted French relations with natives in the Great Lakes region. Emboldened by this apparent weakness, in 1747 Orontony quietly recruited the Miamis and several other regional nations into a general armed uprising against the French. The plot was prematurely revealed in June 1747, however, when an overeager group of Wyandots killed five French traders and tipped off the commandant of Detroit to the danger.

With the 1747 conspiracy uncovered, several of the native nations involved denied any knowledge of Orontony's plans. Instead, they pledged their loyalty and friendship to the French. Violent clashes between Orontony's remaining allies and the French flared briefly in the summer of 1747 and then abruptly died out. Later that year, Orontony visited Detroit in a bid for peace, but he returned to Sandusky without any firm guarantees from the French commander. In 1748, the French renewed their demand that Orontony break off all relations with the British. Meanwhile, the pro-French Ottawas began preparing a large expedition to send against him should he refuse. Faced with these threats, Orontony burned the Sandusky village and moved his followers south and west to the White River, in what is today Indiana. Yet Orontony's impact on the Ohio region lingered on after his departure. Indeed, a 1749 French expedition from Canada found the Ohio natives resistant to any French presence. Orontony died in Indiana in 1750.

Osages

Native American group located in the upper Mississippi River Valley and lower Missouri River Valley. In colonial times, the Osages were seminomadic and eventually controlled modern-day Missouri, southern Illinois, northern Arkansas, northeastern Oklahoma, and southeastern Kansas. Originally, they were probably part of a single tribe that split and developed into the Osages, the Kasaws, the Omahas, the Poncas, and the Quapaws. In colonial times, they probably numbered around 10,000 people, but as time progressed, their numbers dwindled significantly. Linguistically, the Osages were part of the Siouan-speaking nations.

The Osages called themselves the *Ni-U-Ko'n-Ska*, or "People of the Middle Waters." The word "Osage" came from the name of one of their clans, the Wazhazhes. During French explorations of the Illinois River Valley and the Mississippi River Valley in the late 17th century, French explorers gallicized the name as Ouazhagi. The English later anglicized the name to Osage.

The Osages lived in semipermanent villages in wooded river valleys most of the year. They cultivated corn, beans, squash, and other vegetables. During buffalo hunting season, they made use of temporary shelters. Buffalo provided not only an important food source, but served as a key source of clothing and a trade article.

The Osages were organized into two groups (moieties). The Tsizhu moiety had 9 clans that were associated with the sky and peace. The 15 clans of the Honga moiety were linked with earth and war. Each clan occupied a separate section of their villages and operated as separate military units.

Osage political and religious organizations were closely interconnected and were integrated on both the village and tribal levels. At the tribal level were two hereditary chiefs, one from each moiety. The Osage Nation was divided into five permanently named bands of villages, each with its own set of chiefs, and a council of *Nonhonzhinga* (Little Old Men). The council was primarily a religious body, but it could also deal with civil affairs from time to time.

Europeans first mentioned the Osages in 1683, when Father Jacques Marquette, a Jesuit missionary, encountered them while exploring the Mississippi River Valley. During the 1700s, the French and Osages shared a robust trade in furs, guns, horses, and European goods. The trade gave the Osages great influence with many natives of the region. It also enabled them to act as mediators between the woodlands natives of the east and the natives of the Great Plains to the west.

The profitable trading enabled the French to establish a strong military alliance with the Osages. During the French and Indian War (1754–1763), the Osages actively aided the French. Indeed, Osage warriors fought with the French when the British, under Major General Edward Braddock, approached Fort Duquesne on July 9, 1755. After the French defeat in 1763, the Osages developed contacts with the Spanish, who had gained control of the Louisiana territory. Eventually, however, the Osages engaged in hostile actions against the Spanish.

Oswego, Battle of

Start Date: August 13, 1756 End Date: August 14, 1756

Key French victory over the British on August 13–14, 1756, during the French and Indian War (1754–1763). Oswego is located in New York on Lake Ontario's southeastern shore. Governor General

Pierre de Rigaud de Vaudreuil of New France feared simultaneous British attacks launched from Oswego and the Champlain Valley against Montreal and the St. Lawrence River Valley. He thus advocated an aggressive strategy of striking vulnerable outposts in order to disrupt British operations. His military commander, Major General Louis-Joseph, Marquis de Montcalm, preferred a more cautious policy, however.

Although an English trading post had existed at Oswego since the 1720s, most of its fortifications had been constructed during Major General William Shirley's failed 1755 British expedition against Fort Niagara. The site proved poorly suited for fortifications. The original trading post, a stockaded stone building known as Fort Oswego or Fort Pepperell, had been constructed in a valley along the Oswego River's southern shore. Hills on the north shore and to the south overlooked the post. To secure the area more effectively, Shirley's men constructed Fort Ontario, a star-shaped log palisade, on the northern heights across the river. It too could be dominated by higher ground, however. A third outpost to the south, Fort George, remained incomplete and was virtually indefensible.

In 1756, British colonel James Mercer commanded a 1,500-man garrison at Fort Ontario, including the 50th Regiment and the 51st Regiment, both recruited in the colonies, and a New Jersey regiment assigned to Fort George. Mercer feared that French ships would dominate the lake. Although he had four small warships and another two under construction, Mercer lacked trained seamen, armament, and naval stores.

In order to move against Oswego, in July 1756 Montcalm shifted nearly 3,000 troops from the Champlain Valley to Fort Frontenac at the junction of Lake Ontario and the St. Lawrence River. His force included 1,300 French regulars, 1,500 French provincials, and an assortment of militiamen and natives. It also boasted a siege train of 20 heavy guns.

While Vaudreuil and many Canadian officers advocated attacking Oswego, Montcalm hoped that the mere presence of his force would divert the English away from the Champlain Valley. The risks and logistical difficulties of moving several thousand troops in small boats and supporting a potentially lengthy siege seemed too great. Vaudreuil was confident of victory, however. He understood the weaknesses of the British fortifications and had received reports, judged to be reliable, of low British morale. Systematic French and Native American raids had also severed Oswego's 300-mile supply line from Albany, placing the British at Oswego in a tenuous situation. With all of these factors, Montcalm gradually warmed to Vaudreuil's plan.

On August 10, 1756, Montcalm's improvised invasion fleet of several hundred small craft landed nearly 3,000 men and 80 cannon about two miles north of Fort Ontario. The following day, the French harassed the British garrison with small-arms fire, while axemen cleared the heights overlooking Fort Ontario.

Having positioned their siege guns, on August 13 the French opened artillery fire on the English positions. That night, with Fort Ontario's timber walls unable to withstand the constant pounding

and the French advancing their assault trenches toward the fort, Mercer ordered the garrison to spike its cannon and withdraw across the river to Fort Oswego. Occupying the abandoned fort and the surrounding heights, Montcalm's artillerymen then positioned their guns overlooking Fort Oswego, a mere 400 yards distant.

At dawn on August 14, the two forts exchanged artillery fire, but their exposed position put the British at a severe disadvantage. Shortly after the opening of the bombardment, a French and native force crossed the Oswego, effectively surrounding the British. At this critical point in the battle, around 10:00 a.m., a cannonball struck Mercer and killed him. Unnerved by Mercer's death, his second-in-command, Lieutenant Colonel John Littlehales, faced a situation in which his forces were cut off by land and water and under continuous French fire.

Littlehales quickly convened a council of war that recommended immediate surrender. Littlehales concurred, expecting that the garrison would then be paroled. Although the British position was indeed untenable, the French bombardment had inflicted fewer than 50 casualties.

With Oswego's capitulation that same day, the French captured nearly 1,600 troops and camp followers. But instead of releasing them as the British expected, they transported their prisoners to New France. The French also secured 6 ships, 77 artillery pieces, 12 tons of gunpowder, 200 tons of provisions, and enough specie to more than pay for the cost of the expedition. Despite pledges of protection, Montcalm's native contingent also looted the prisoners' possessions and killed some 30 wounded men before the French could intervene.

What Montcalm thought at first would be a mere diversion had proved a major success. British forces, already grappling with the Lake Champlain expedition, shifted troops toward Oswego, but halted them on word of the fort's capitulation. Given the forts' inherent weaknesses it is doubtful that even timely reinforcements could have altered the outcome.

Montcalm debated continuing the offensive but instead razed the British forts and withdrew. The French triumph at Oswego secured Lake Ontario and removed the English threat to New France's vital trade and supply connections with its western outposts. It also inspired many western Native Americans to rally to the French.

Ottawas

Native American people who inhabited Manitoulin Island along the northern reaches of Lake Huron. The Ottawas belonged to the Algonquian linguistic and cultural group, being closely related to the Ojibwas, the Potawatomis, and the Algonquins. The Ottawas entered the written record when Samuel de Champlain encountered people he referred to as the *Cheveux relevés* (raised hairs) in 1615.

French observers were impressed by the Ottawas' martial skills, and Champlain himself claimed that they were formidable warriors. Similar to other Great Lakes groups, the Ottawas practiced scalping, torture, adoption of prisoners, and symbolic eating of the flesh. They preferred to engage in guerrilla-style warfare. The Ottawas supported themselves by agriculture, trading, hunting, fishing, and gathering. Indeed, the French soon discovered that they were perceptive and highly effective traders.

The Ottawas traditionally occupied the north shore of Georgian Bay (Lake Huron), Manitoulin Island, as well as the Bruce Peninsula in Ontario. They fled to the western shores of Lake Superior after 1649 to avoid attacks by the Iroquois. By 1670, they began to return east after clashing with Dakota and Winnebago groups in present-day Wisconsin. By 1701 the Ottawas had settled throughout the Great Lakes–Ohio Valley region, and by the 1770s they had begun to venture into Manitoba.

"Ottawa" means "trader," which reflects the role they played in the Great Lakes. The term, however, also applied to anyone engaged in trade. This led 17th-century French observers to give the name to all non-Huron traders from the upper Great Lakes. This broad use has hindered identification of the Ottawas prior to the 18th century. By the early 1700s, the French recognized several subdivisions among the Ottawas, who usually acted independently of other related native nations.

Ottawas warred with the Iroquois, the Fox, and the Mascoutens. They belonged to the Three Fires Confederacy, a sociopolitical and military alliance, along with the Ojibwas and the Potawatomis. As allies of the Hurons, the Ottawas became allied to the French and thus became involved in the Beaver Wars (1641–1701). In 1670, the French thwarted Ottawa attempts to conclude a peace treaty with the Iroquois. In 1701, under the auspices of the French, several branches and chiefs of the Ottawa Nation signed the Treaty of Montreal.

A number of Ottawas settled in the Detroit region after 1701. On the instigation of Lamothe Cadillac, clashes soon erupted between the Ottawas, the Fox, the Miamis, and the French, which led to Ottawa involvement in the Fox War of 1710–1738. The Ottawas in the Detroit region also grew to distrust their Huron allies, accusing them of conspiring with the Iroquois and other enemies.

The Ottawas participated in the colonial wars as allies of France, especially during the French and Indian War (1754–1763). In 1763,

Ottawa leader Pontiac united several native nations in the Great Lakes—Ohio Valley region and attempted to drive the British from that area. After the Niagara Peace Treaty of 1764, the Ottawas became allies of the British. Despite the broad alliance patterns, internal divisions among the Ottawas often permitted groups and individuals to hold neutral, anti-French, or anti-British sentiments.

Ouiatenon Trading Post and Fort (Indiana)

French trading post built in 1718 (and called a fort beginning in 1742), situated on the west bank of the Wabash River, near present-day Lafayette, Indiana. The Ouiatenon Trading Post consisted of a dozen cabins in two rows surrounded by a 10-foot-high stockade. Ouiatenon was the first fortified European post in Indiana and considered the most southwesterly point of French Canada. It was named for the Weas (in French, Ouiatanons), a subgroup of the Miamis that had evolved into a separate group.

Although they were allied with the French against the Iroquois, the Weas frequently found the offerings of English traders tempting. Moving from the Chicago area, they settled along the middle section of the Wabash River in the early 18th century and resisted French efforts to move them back. Members of related nations (Piankashaws, Mascoutens, Kickapoos) soon joined them there. The French founded the Ouiatenon Trading Post in 1718 to protect their fur trade from English competition. It was also designed to keep open the important Wabash-Maumee route to the Mississippi River and to maintain peace between the Weas and other French allies, particularly the Illinois.

François Picoté de Belestre established the post with four soldiers, three traders, and, at the Weas' request, a blacksmith. In 1721, Captain Jacques-Charles Renaud Dubuisson established Fort Miami among the Miami people at the forks of the Maumee River. With jurisdiction over both sites, he resided at Miami and placed François-Marie Bissot de Vincennes in command at Ouiatenon. The Miami and Wea posts produced few furs (in part, because of illicit trading with the English). However, the French were reluctant to abandon them and risk losing the strategic position to their rivals.

In 1729, Vincennes and a group of Piankashaws relocated to the mouth of the Wabash (present-day Vincennes, Indiana), in essence "defecting" to French Louisiana. A fur trader, Simon Réaume, then became acting commander of the post for a number of years. From there, he led as many as 400 Weas and Piankashaws during the siege against Fox Fort in 1730. The French also induced the Weas to

attack the Chickasaws, which they did regularly from 1731 until about 1742.

A level of tension nevertheless persisted between the Weas and the French. In 1734, there were rumors that the Weas would defect to the British, and a group of Weas pillaged the post after a fight with a young Frenchman. In 1742, the Weas complained about French regulations that restricted the number of traders at the post.

King George's War (1744–1748) created severe shortages and inflation. That contributed to a Miami rebellion in 1747 led by Memeskia (known as "Old Briton" to the English, "La Demoiselle" to the French). Afterward, the French became increasingly suspicious of Wea loyalty. Yet they remained reluctant to abandon the strategic post completely. They manned Ouiatenon only during the winters of 1747–1748 and 1748–1749.

With growing tensions in the Ohio Country, Ouiatenon as well as Native American trade were placed under the commandant of Detroit. In 1751, with Louisiana once again enticing natives to move to its territory and Memeskia encouraging them to trade with the English, Canada sent reinforcements to Ouiatenon to keep watch over them. François-Marie le Marchand de Ligneris, stationed at Ouiatenon, argued that France must seize the Ohio Country or risk losing the Weas and others to the English.

The Weas participated in several raids in the French and Indian War (1754–1763), siding with the French. Some served with de Ligneris at Fort Duquesne. English lieutenant Edward Jenkins accepted the surrender of Ouiatenon late in 1761, after the fighting had ended. Subsequently, he commanded a garrison of 20 at the fort, while 200 Weas, 180 Kickapoos, 90 Macoutens, and 100 Piankashaws lived adjacent to it. There were also about 14 French families nearby.

The Weas and others objected to English policies, including their stinginess with presents and restrictions on ammunition sales. In 1763, they joined Pontiac's Rebellion. Having seized Jenkins and several of his men, they demanded and received the surrender of the fort on June 1, 1763. The famed trader George Croghan, taken to Ouiatenon as a prisoner in 1765, met with Pontiac there and convinced him to seek terms with Indian agent Sir William Johnson.

Ouiatenon was not garrisoned after 1763. The natives and French traders still residing there reclaimed the site, although the local fur trade was largely depleted. It was occupied for a time during the American Revolutionary War, and U.S. troops under General Charles Scott burned the post, the native villages, and surrounding fields in June 1791, at a time of Native American unrest.

Oyster River (New Hampshire)

English frontier settlement in New Hampshire notable for the Native American attack it suffered on July 19, 1694. The assault was made by a largely Abenaki force. Striking by surprise, the attacking warriors killed and captured approximately 100 colonists. This raid was the most significant Native American victory of King William's War (1689–1697) in New Hampshire.

In 1693, tiring of their war with the English and the suppression of trade it had caused, one Abenaki faction, associated with the prominent Penobscot Abenaki headman Modockawando, decided to seek a truce with the English and signed a peace agreement on August 11. The treaty upset the French, who relied on the Abenakis to mount attacks along the New England frontier. The treaty also angered those Abenakis who preferred that the war continue, including Modockawando's principal rival, Moxus.

In the spring of 1694, the French discovered evidence that Modockawando had used the treaty negotiations as an opportunity to sell Abenaki land without the knowledge of other Abenaki headmen. The French immediately alerted Moxus, who informed the other Abenakis of Modockawando's actions, thereby discrediting his peace faction. Accordingly, the French and the Abenakis began planning an expedition against the English, which the English did not expect.

The initial Abenaki force, accompanied by several French soldiers, traveled to Oyster River (also known as Durham), securing additional Abenakis and Pennacooks. By the time the raiding party reached Oyster River on the evening of July 18, it numbered more than 230 warriors. The natives separated into small bands and spread out throughout the village.

Word that Modockawando had concluded peace with the English had arrived in Oyster River a few days earlier. As a consequence, the settlers had disbanded their night watch, allowing the natives to take up their positions undetected. The attack began prematurely on the morning of July 19, when an early riser left his house. The nearby warriors feared he might discover them and give the alarm, so they commenced the assault earlier than they had planned.

Despite this setback, the natives devastated the town. The warriors killed 45 colonists and took prisoner another 49. They also burned most of the dwellings and adjacent fields. The warriors then withdrew before reinforcements from neighboring settlements could arrive.

The English regarded the Oyster River attack as an Abenaki betrayal, coming as it did in the wake of a peace treaty to which the colonists believed all Abenakis had assented. It hardened the colonial perception of the Abenakis as fundamentally untrustworthy and cemented English hostility toward them. The Oyster River attack began a new war between the two sides that would persist as late as 1699, long after the French had concluded a separate peace.

P

Pacifism

The principle that holds unequivocally all forms of violent conflict to be morally and socially unacceptable. Pacifism seeks alternatives to violence and war through nonviolent and peaceful negotiation and cooperation. Pacifism in North America developed from the European religious movements of the 16th and 17th centuries, especially the Anabaptist movement and German Pietism. Predominant among pacifist sects in North America were the Religious Society of Friends (Quakers), the Mennonites, the Amish, the Schwenkfelders, the Church of the Brethren (Dunkers), and the Moravians.

Pacifism meant more than a rejection of fighting. Indeed, attitudes toward fighting varied, according to religious affiliation. Quakers were the most restrictive; they would do little to aid in a war besides paying taxes to a government. The Mennonites and the Amish would pay taxes and agree to supply substitutes and to pay fines in lieu of militia service. Moravians refused to serve in the army or militia but would pay substitutes for such service and organize their own military defenses, which included drilling with weapons.

Pacifists' religious toleration and renunciation of war was based on the teachings of Jesus and prohibitions on war as expressed in the New Testament. Pacifists did not focus on the Old Testament's depiction of or justifications for war.

William Penn and other leaders in Pennsylvania never used their charter-based authority to wage war against pirates, Native Americans, or other possible enemies. They believed that there could be a prolonged peace with the Native Americans. Indeed, for nearly three-quarters of a century the Quakers in Pennsylvania and the Delawares (Lenni Lenape) lived in relative peace while other English colonists waged war against the Native Americans.

All pacifist groups also protested, in one way or another, the domination of the church by the state, excessive government inter-

Seventeenth-century etching of a meeting of Quakers, also known as the Society of Friends. (Brown Brothers)

ference, and ecclesiastical hierarchy. They also eschewed elaborate religious ceremonies. Quakers were unique among pacifist sects in that they did not reject political office. Indeed, they sought it and were prominent in the government of Pennsylvania, where most of them settled.

The Quakers were the first pacifist group to arrive in North America, in the 1650s. They settled in colonial Rhode Island, North Carolina, Maryland, Pennsylvania, and western New Jersey. Penn founded Pennsylvania as a refuge for pacifists and as a "holy experiment" committed to spiritual and theological toleration. Quakers set their principles on the basis of conscience and communal harmony and called for individuals to experience God with an "inner light." The Quaker peace testimony (a declaration of religious affirmation) was an expression of choosing between reasons of state and the law of love. It also advocated combating evil with inner spiritual weapons rather than weapons of destruction.

Consistent with the Quaker reasoning of spiritual weapons and nonparticipation in war and other forms of violence were the Anabaptists and their Mennonite successors who followed the Quakers to North America. Most members of these pacifist sects settled in the mid-Atlantic area of colonial English North America rather than in New England, New York, and the South, areas where there was more fighting. Moravians did establish colonies in Georgia and later in North Carolina, however. Expansionism and fighting with the natives there led many of them to relocate to Pennsylvania. The general immunity of Pennsylvania from warfare ended with the French and Indian War (1754–1763) and Pontiac's Rebellion (1763), when Pennsylvania saw considerable fighting. Nonetheless, few members of the pacifist sects took up arms against either the French or the natives.

Between the end of the French and Indian War in 1763 and the beginning of the American Revolutionary War in 1775, Quakers and Mennonites extended their commitment to pacifism by denouncing human slavery, which they held to violate their religious beliefs and saw as a hidden seed of war.

Pacifists often faced discrimination from other English colonists. This had as its roots the pacifist renunciation of war against Native Americans and against the French and the Spanish. During the American Revolutionary War, many Patriots equated pacifists with Loyalists, which led to beatings, whippings, imprisonment, and, in some cases, exile. However, colonial and state governments had to acknowledge the principle of conscientious objection to war and to present alternative schemes for pacifists to do their part in times of conflict.

Government legislative substitutes for wartime service included fines, increased taxes, and conditional exemptions. Sometimes the government simply ignored the conscientious objection issue and left pacifists free to practice their religion. Legislation regarding alternatives to military service varied according to an individual colony/state's military policy, placing conscientious objectors at the mercy of each respective government. Most members of the sects remained firm in their stance. Quakers further alienated themselves from their communities during both peace and war by refusing to attend public prayer services.

The pacifist sects were not immune to internal turmoil over the alternatives to military service advanced by the colonial governments. German Brethren in Maryland, for instance, could refuse church membership if a member of the congregation either signed

the state-required oath of allegiance or enlisted into military service. Unless the individual who signed the oath or enlistment recanted, he could expect to be excommunicated from the Brethren. Similarly, if a member of the Society of Friends strayed from the church's teachings, he or she was no longer able to take part in church activities. For most pacifists, America was a true haven, where they were indeed free for the most part to practice their beliefs.

Pamunkeys

An Algonquian-speaking Native American group that belonged to the Powhatan Confederacy and lived along the Pamunkey River in tidewater Virginia. The Pamunkey River is formed by the confluence of the North Anna River and the South Anna River. The Pamunkey then joins the Mattaponi River to form the York River near present-day West Point, Virginia. The Pamunkeys' way of life was similar to that of other natives living in the eastern woodlands. Men engaged in hunting and fishing, and women practiced limited agriculture. They also made clay pots, jars, and pipes.

The Pamunkeys were among the 31 nations that formed the Powhatan Confederacy and one of the tribes Chief Powhatan (Wahunsonacock) had inherited from his parents late in the 16th century. Powhatan's three brothers—Opichapam, Opechancanough, and Kekataugh—were chiefs (or *werowances*) in the Pamunkey territory.

In the winter of 1608–1609, English captain John Smith, accompanied by 38 men, visited the Pamunkeys, who were then living along the York River. After a tense verbal exchange with the Powhatans who were present, Smith threatened to kill a Pamunkey. He then intimidated a group of warriors, forcing them to load the English ship with grain. Two days later, Smith's party arrived at Opechancanough's town. After a bit of trading in exchange for corn, Smith found himself surrounded by hostile warriors. In the tension of the moment, he allegedly challenged Opechancanough to individual combat.

In 1622, the natives of the Powhatan Confederacy attacked the settlers in the colony of Virginia, sparking the Second Anglo-Powhatan War (1622–1632). The Pamunkeys took part in the uprising. Opechancanough, the brother of the late Chief Powhatan, had assumed leadership of the Powhatan Confederacy and planned

Engraving depicting the capture of Captain John Smith in December 1607 by the Pamunkey Native Americans. (Smith, John. *The True Travels, Adventures, and Observations of Captain John Smith,* 1630)

and led the native alliance. His actions placed the Pamunkeys in a very difficult situation. In July 1624, the Pamunkeys were forced to defend their enormous cornfields from the English. Following a two-day pitched battle, the English were able to destroy virtually all of the corn. This event was quite damaging to the Pamunkeys, who lost much of their reputation as keen warriors.

The fighting between the Pamunkeys and the English continued until 1632, when the settlers made peace with both the Chickahominys and the Pamunkeys. Nevertheless, the peace treaty forbade English trade or other contact with the natives. The Second Anglo-Powhatan War wrought dramatic and negative consequences on all of the Powhatan tribes. Their populations were greatly reduced, and many of the old ways of life were lost.

In 1644, Opechancanough led the Powhatans into another conflict against the English (the Third Anglo-Powhatan War, 1644–1646). Once more, the Pamunkeys joined the fray. The fighting took a particularly devastating toll on the Pamunkeys, for much of the turmoil unfolded on their ancestral lands near the headwaters of the York River. Opechancanough's death brought an effective end to the conflict and to the Powhatan Confederacy. In 1646, Opechancanough's successor, Necotowance, believed also to have been a Pamunkey, signed a treaty with the English. He agreed to relinquish land to the settlers while his people would become tributaries to the English Crown, presumably for reasons of defense and protection.

With the collapse of the Powhatan Confederacy, individual chiefs moved to gain power. In the case of the Pamunkeys, the *weronsqua* (woman head) Cockacoeske sought the leadership of the nation from her inherited relationship with the late Opechancanough. However, the colonial government misunderstood that she was, in effect, the new tribal leader and regarded her husband Totopotamoi as the new chief of the Pamunkeys. In 1656, the English sought the help of the Pamunkeys and the Chickahominys in fighting other Native Americans. The Pamunkeys paid dearly for the action because the English commander acted incompetently, resulting in an unnecessary defeat in which Totopotamoi was killed.

In 1676, Virginia was wracked by Bacon's Rebellion. In such tense times, colonial militias often attacked friendly natives as well as those who were hostile. To the natives' way of thinking, such bloodshed required retribution in blood. In Bacon's Rebellion, the Pamunkeys found themselves caught in the middle. Gov. Sir William Berkeley rightly interpreted the 1646 Virginia-Indian Treaty as offering the natives protection against all rebels. Thus, he was obliged to protect them from Nathaniel Bacon and his rebels. Bacon's followers, however, saw Berkeley as trying to monopolize trade with the natives. The rebels soon launched attacks against the Pamunkeys.

The Pamunkeys were so frightened by Bacon's followers that they fled their villages and hid in the surrounding swamps. In the fall of 1676, Bacon's followers located the Pamunkeys in their swamp hideouts. When Bacon's forces attacked, the Pamunkeys did not resist, yet many were shot. Pamunkey prisoners were paraded to Jamestown to demonstrate Bacon's skill as an "Indian fighter." Bacon died a few weeks later, but hostile attitudes among the rebel colonists almost resulted in the Pamunkeys being sold into slavery.

After Berkeley's return to Jamestown in 1677, a new treaty was signed between several native nations (including the Pamunkeys) and the colony of Virginia. The Virginia-Indian Treaty of 1677/1680 created a new reservation for each nation. Cockacoeske was also recognized as the *weronsqua* of the Pamunkeys. By the late 1700s, the Pamunkeys had declined to a small handful of people.

Parade Fort (Connecticut)

English-built post fortified in 1691, situated in New London (Connecticut) near Long Island Sound. New London served as the Connecticut Colony's main port of entry. The Parade Fort stood at the

foot of State Street, about 264 feet from the edge of the Thames River and not far from the river's outlet into Long Island Sound. An associated guardhouse and a powder magazine stood on higher ground not far to the west.

The Thames River, technically a flooded valley, gave New London one of the deepest harbors on the East Coast. Indeed, its strategic significance was recognized at an early date. Settlement of the area began in 1646, and in the same year the New England Confederation found in favor of Connecticut's claim to the territory over that of Massachusetts Bay. The focal point of the settlement was a small square called the Parade, near the wharves.

The Parade was fortified in 1691, during King William's War (1689–1697), on the orders of the Connecticut General Court. To arm the new structure, six "great guns," probably 4- or 6-pounders, were brought to New London from the older fort at Saybrook. More cannons were acquired in 1739, on the eve of the Anglo-Spanish War (1739–1744).

In 1775, at the beginning of the American Revolutionary War, other forts were built nearby. They included Fort Trumbull just down the river from Parade Fort in New London, and Fort Griswold across the river in Groton. Parade Fort, along with the other forts and much of the town, was destroyed on September 6, 1781, as a consequence of an attack led by Benedict Arnold. Parade Fort was never rebuilt.

Pardo, Juan

Born: Unknown Died: Unknown

Officer in the Spanish Army. A junior officer under the command of Pedro Menéndez de Avilés, Juan Pardo led two *entradas* into the southern Appalachian Mountains during the mid-16th century in an effort to extend Spanish control in the region. Little is known of Pardo's origins, but there is a possibility that he came to America with Menéndez. Menéndez established Santa Helena near Beaufort, South Carolina, as a presidio and mission to control and convert the local native people. He placed Pardo in command of the garrison there.

As part of this initial attempt by Menéndez to incorporate La Florida (the Spanish term for the Southeast) into the Spanish empire, Pardo led *entradas* during 1566–1567 and 1567–1568 from Santa Helena through the Carolinas and the southern Appalachians into the chiefdom of Coosa. Along the way, Pardo built five small

forts to link the interior with the coast, garrisoning each with only a handful of soldiers. All of these fortifications disappeared within a year as the soldiers fled back to the coast, were killed by hostile natives, or were absorbed by the local natives.

These expeditions may have helped spread diseases into the interior of La Florida that led to widespread native depopulation in the region and destabilized many of the chiefdoms there. Additionally, one of the garrisons left behind by Pardo allied with some local natives and destroyed the chiefdom of the Chiscas in southwest Virginia. This group later moved down out of the Appalachians to raid the Spanish missions in Florida during the 17th century.

After these two expeditions into the interior of the Southeast, Pardo disappeared from the historical record. Nothing is known about the rest of his life. The official records left by the Pardo expeditions have provided modern scholars with valuable information concerning the location of many native groups in the interior Southeast during the 16th century.

Paris, Treaty of

Event Date: February 10, 1763

Signed by Britain, France, and Spain on February 10, 1763, the Treaty of Paris brought to a close the struggle between those nations known in America as the French and Indian War (1754–1763). Five days later, on February 15, Austria and Prussia signed the Treaty of Hubertusburg, ending the larger European part of this war, the Seven Years' War (1756–1763). Under the terms of this treaty, Austria definitively ceded Silesia, confirming Prussia as a major power.

The French and Indian War began in America in 1754 with fighting between French and English colonists in the Ohio River Valley. Within a year the conflict had spread to Nova Scotia and the West Indies. By 1756, the great powers of Europe (France, Britain, Prussia, Austria, and Russia) were all at war on the continent, while Britain and France waged a struggle for world empire on the seas

Contemporary illustration of the fireworks display in Paris on June 22, 1763, celebrating peace after the Seven Years' (French and Indian War). (Giraudon/Art Resource, NY)

and in such diverse locations as the West Indies and India. The initial lineup saw France, Austria, and Russia pitted against Prussia and Britain; Spain joined on the side of France in 1762, but this did not prevent the British from winning key battles in Canada and the Caribbean.

The British were able to keep Prussia in the war by financial subsidies, while focusing their own military efforts in the colonies and on the Royal Navy. The French, although they had far greater assets than the British, were forced to take an active role in the fighting on land in Europe and thus had far less to expend on the fighting at sea and in the colonies. The Royal Navy cut the vital supply lines between France and its overseas colonies.

The Treaty of Paris recognized this British military triumph. No other international agreement before or since saw the transfer of so much American territory. Britain received control of all of Canada, including Cape Breton Island and the St. Lawrence islands. Britain also secured from France recognition of its control of the Ohio River Valley as well as all the territory east of the Mississippi River (including the port of Mobile) except the city of New Orleans. In the Caribbean, Britain secured St. Vincent, Dominica, Tobago, Grenada, and the Grenadines. There was considerable debate in Britain over the wisdom of taking Canada and removing that threat to the often

troublesome northern English colonies rather than demanding the rich sugar island of Guadeloupe, but in the end Prime Minister William Pitt prevailed on the grounds of military security as well as trade considerations.

France retained the islands of Saint-Pierre and Miquelon off the southern coast of Newfoundland, as well as fishing rights on Newfoundland's banks. In the West Indies, Britain returned to France the Caribbean islands of Martinique and Guadeloupe, while, as noted, France restored to Britain St. Vincent, Dominica, and Tobago.

In Europe, France agreed to evacuate its positions in the German state of Hanover. In India, France received back Pondicherry, but its fortifications were to be razed and limits were placed on French military strength. French stations in Bengal were limited to commercial centers. (The French dissolved their Compagnie des Indes in 1763.) In Africa, the French acquired the slave port of Goree off the western coast, and Britain gained the Senegal River and its settlements. The treaty also compelled France to drop any compensatory claims for shipping losses and destroy the maritime fortifications at Dunkerque (Dunkirk).

Spain's ineffective participation in the war brought mixed results in the treaty. Spain forfeited all Canadian fishing rights and traded all of Florida (Spanish possessions east of the Mississippi) to Britain for the return of Cuba from Britain. Britain also returned Manila. The British promised to demolish fortifications along the Honduran coast, but Spain was forced to recognize the rights of its loggers in that area. In Europe, Spain returned Minorca to England. In the secret Treaty of San Ildefonso of November 3, 1762 (by which France secured Spanish participation in the war), Spain had already acquired from France both New Orleans and all of Louisiana west of the Mississippi River.

The Treaty of Paris of 1763 was a watershed mark for British power and a great humiliation for France, confirming Britain as possessing the world's most extensive overseas empire. The treaty did not, however, usher in a period of peace in North America. Although the French and Spanish threats to British colonists were now gone, conflict with Native Americans was far from over. In addition, disagreements between the colonists and the mother country escalated a decade later into the American Revolutionary War. Although the costs for their nation would be high indeed, French statesmen who were bent on revenge for the losses of 1763 embarked on a program of support for the American Patriot cause. The next treaty of Paris, that of 1783, stripped Britain of its North American colonies, save for Canada, and secured the French a measure of revenge for 1763, albeit at high cost. A bankrupted France itself succumbed to revolution in 1789.

Passage Fort (South Carolina)

English-built fort erected in December 1717 on Daufuskie Island, South Carolina. Passage Fort sat on Bloody Point, at the southernmost tip of the island. Daufuskie Island is strategically located between Hilton Head Island immediately to the north and Tybee Island, Georgia, immediately to the south. Between the two lies the majestic Savannah River, which separates South Carolina and Georgia and provided ready access to the interiors of both colonies. Passage Fort was never well fortified and was only sporadically garrisoned.

In the beginning, the palisaded compound was manned by scouts from Fort Beaufort, located about 25 miles to the north.

Scouts were able to monitor incoming ship traffic owing to the fort's proximity to the open ocean, the Savannah River, and the inland passage, which surrounded the fort on all sides save for the ocean frontage. In a surprise raid during the winter of 1728, a Yamasee raiding party caught the fort's garrison by surprise and proceeded to kill or capture all of the defenders. By 1765, Passage Fort had been abandoned.

Paxton Boys Uprising

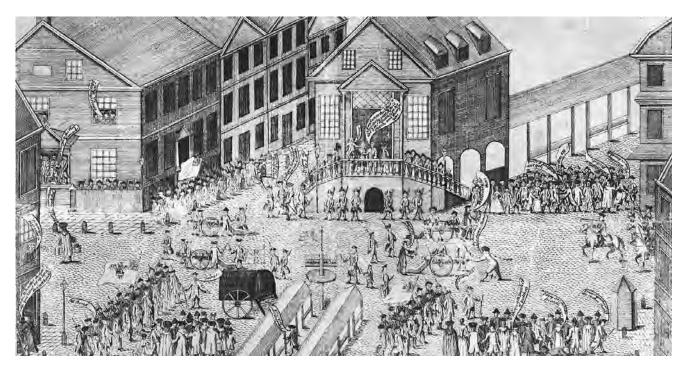

Start Date: December 14, 1763 End Date: January 1764

Series of deadly attacks on Native Americans in central Pennsylvania led by a group of lawless colonials in late 1763, followed by a threatening march on Philadelphia early in 1764. The early stages of the Paxton Boys Uprising began in the spring of 1763. Indeed, Pontiac's Rebellion had already broken out in western Pennsylvania among native groups reacting to Britain's occupation of the Ohio River Valley after the French and Indian War (1754–1763).

By July 1763, reports of native attacks on white frontier settlements and rumors of atrocities reached Paxton, a town located at the old native village of Paxtang, about 70 miles west of Philadelphia. In response, some 110 men from Paxton marched on a scouting mission northwest toward the Susquehanna River's west branch. In late August, hostile natives surrounded and attacked the Paxton contingent. The expedition retreated to Paxton after a brief battle that resulted in the deaths of 4 Paxton men and the wounding of 6 others.

In October 1763, another armed band of Paxton men marched along a different branch of the Susquehanna River in order to gauge native strength and possibly to identify unauthorized white squatters. During their expedition, they came on the ruins of an encampment of Connecticut settlers. There they found nine men and one woman killed and mutilated. When the Paxton men returned with news of the destroyed Connecticut settlement, suspicion and hostility began to mount concerning the peaceful Conestogas living in the midst of white Pennsylvanians. Without any concrete evidence, some Paxton residents began suggesting that the Conestogas presented an imminent threat.

The first large-scale event of the uprising happened on December 14, 1763. On that day, 50 armed men on horseback, calling themselves the Paxton Boys, descended on a native village at the town of Conestoga and slaughtered most of its inhabitants. Later in the day,

Preparations in Philadelphia to repel the Paxton expedition of 1764. Shown are the Old Court House on Second Street and the buildings around it. Engraving by Henry Dawkins, ca. 1764. (The Granger Collection)

as nearby settlers sifted through the debris of the village, they found a bag containing several old documents and two wampum belts. The items were tokens of respect natives used to symbolize treaty agreements. The oldest of the documents was a 1701 treaty signed by William Penn, the founder of the colony, cementing a peaceful relationship between the colony and the Conestogas.

After the attack on the Conestoga settlement, Gov. John Penn, grandson of William Penn, attempted to prevent further atrocities by ordering the detention of the Paxton Boys. Although local officials ignored the governor's order to detain the Paxton Boys, they did try to protect the surviving Conestogas, some 14 men, women, and children. Locals brought the stunned survivors to a temporary jail located in a public building in Lancaster County. The attempt to protect the remaining Conestogas proved ineffective and half-hearted, as local officials offered the Conestogas no real protection and left the jail unguarded. Concentrating all of the survivors in one location proved to be devastating to the Conestogas when the Paxton Boys struck on December 27, 1763, killing all the Conestogas inside the jail.

In January 1764, the Paxton Boys embarked on a threatening march on the colonial capital of Philadelphia. Their immediate objective was to attack a group of some 140 Delawares who were Christian converts and had been sent to Philadelphia for protection after the first Paxton attacks. The Paxton Boys attracted more recruits on the march, raising suspicion that they sought to overthrow the Pennsylvania government. As they approached the city, Philadelphians armed themselves to drive back the Paxton Boys. In

a last-minute negotiation, however, Benjamin Franklin and other city officials convinced the Paxtonians that they could not overpower the combined forces of the armed Philadelphians and royal troops within the city.

Following this parley, the Paxton Boys returned home with a pledge from officials that they would not face prosecution for their actions. Local officials also demurred from trying them for their nefarious deeds. Although the Delawares escaped a direct attack, about a third of them died after contracting smallpox during their protective confinement in the city.

See Dutch-Indian Wars

Pécaudy de Contrecoeur, Claude-Pierre

Born: December 28, 1705 Died: December 13, 1775

French colonial regular army officer. Claude-Pierre Pécaudy de Contrecoeur was born in Contrecoeur, Quebec, on December 28, 1705, the son of an officer in the French Army. He entered into his father's profession at age 16 and by 1729 had become a second ensign. Promoted to captain in 1748, he served in a unit commanded by his father at Fort St. Frédéric (Crown Point), New York. Pécaudy subsequently assumed command of Fort Niagara in western New York once the French began developing an important chain of fortifications into the Ohio River Valley.

Simultaneously, Virginia land speculators of the Ohio Company had been crossing the Appalachian Mountains and were pressing claims to the same territory. The pivotal point in Pécaudy's career came in January 1754, when he received orders to march south from Fort Niagara to the Forks of the Ohio River (modern-day Pittsburgh). There he was to construct a major new fortification. While fulfilling this task, he encountered Ensign Edward Ward and 41 men of the Virginia Militia near the very site he intended to garrison. Pécaudy immediately ordered the English from the area, tore down their small stockade, and commenced building a new and spacious frontier fortification. It was subsequently christened Fort Duquesne in honor of Governor-General Ange de Menneville, Comte de Duquesne. Fort Duquesne, a 150-foot-square edifice built of wood and earthen works, could accommodate a garrison as large as 300 men.

The pace of conflict in the Ohio Country quickened in the spring of 1754, when Pécaudy became aware that another group of Virginians, under Lieutenant Colonel George Washington, was also trespassing on land claimed by France. He promptly dispatched Ensign Joseph Coulon de Villiers de Jumonville and 30 men to evict the Virginians. Washington's men ambushed Jumonville's force en route, resulting in the death of Jumonville and several of his men. Pécaudy, enraged by what he considered the assassination of a diplomatic courier, then ordered Captain Louis Coulon de Villiers, the slain man's brother, to evict the trespassers with a larger force.

The French experienced little trouble in forcing Washington's surrender at Fort Necessity on July 3, 1754, which cleared the contested land of English forces and reinforced France's territorial claims. For his part in the affair, Pécuady was commended by the governor-general. A year later, however, he found himself at the epicenter of the newly declared French and Indian War (1754–1763).

In July 1755, Pécaudy dispatched Captain Daniel Hyacinthe Marie de Beaujeu to the Monongahela River, where he executed a devastating ambush on English soldiers and American militia under Major General Edward Braddock. Pécaudy secured Braddock's papers, which he sent along to Quebec with a request that he be allowed to retire.

In 1756, Pécaudy finally mustered out, receiving the prestigious Cross of St. Louis for his lengthy and distinguished service to France. He settled at Quebec and, following the British conquest of Canada, took an oath of allegiance to Britain. Now a private citizen, Pécaudy amassed a considerable fortune. In January 1775, Governor-General Guy Carleton appointed him to the Montreal Legislative Council. Pécaudy died there while serving in this capacity on December 13, 1775.

Penn, William

Born: October 14, 1644 Died: July 30, 1718

English Quaker who advocated religious and civil liberty and founded the colony of Pennsylvania as a "holy experiment," as a place where these liberties could exist. William Penn was born in London on October 14, 1644, the son of Admiral Sir William Penn, a wealthy naval officer, landowner, and good friend of King Charles II. Although his father was an Anglican, Penn was drawn to the Puritans. In 1662, after two years' study at Christ Church College, Oxford University, he was expelled because of his refusal to accept the university rule that all students must attend the Church of England. Hoping to change his son's nonconformist religious beliefs, Penn's father sent him to Italy and France.

On his return, Penn studied law in London, then went to Ireland to manage his father's estates there. In Ireland, Penn met the Quaker preacher Thomas Loe and became convinced of the truth of the Quaker faith. To his father's great chagrin, Penn gave up a promising future to associate himself with a plain-living and plainthinking sect, the members of which were scorned, ridiculed, and often imprisoned.

Penn himself was imprisoned several times for preaching and writing about the Society of Friends (Quakers). While locked up in the Tower of London, he wrote his celebrated *No Cross, No Crown* (1669), setting forth the Quaker doctrines of humility and nonviolence. Although his father secured his release after eight months,

An early 20th-century painting depicting King Charles II of England granting William Penn the land now known as Pennsylvania at a meeting in Whitehall in 1681. (Library of Congress)

Penn was again arrested in 1670 for preaching on a London street. He defended himself so eloquently that the jury found him not guilty. When it refused to change its verdict, the jury was imprisoned by an angry judge but later released.

In 1670, Penn's father died after having become reconciled with his son. The admiral's legacy to Penn included his extensive estates in England and Ireland as well as his personal friendship with King Charles II and his brother, James, Duke of York. Penn spent the next decade writing pamphlets in defense of Quakerism and going on preaching missions throughout England, the Netherlands, and northern Germany.

During these years, Penn developed an interest in America. In 1677, he helped settle the affairs of a Quaker colony in New Jersey, for which he took part in the drafting of a liberal charter. Then in 1680, Penn asked King Charles II to repay a debt of £16,000 owed to his father with a grant of wilderness land in America. In 1681, Penn's dream of a holy experiment came true when he was granted a charter giving him proprietary rights over the territory west of the Delaware River between New York and Maryland.

In 1682, Penn drew up a "Frame of Government," providing for an elected assembly. Penn's Frame may have had an influence on

the U.S. Constitution (1787). Other laws guaranteed free elections and trial by jury and established a humane penal code.

Attracted by promises of cheap land and religious freedom, settlers from the Netherlands and Germany, as well as England, poured into Pennsylvania, or Penn's Woods, as the new colony was called. Penn went there himself in 1682. He helped get the government set up and held friendly councils with the Native Americans to negotiate for the transfer of their lands and ensure peaceful relations. A pioneer in city planning, Penn laid out Philadelphia in an orderly checkerboard pattern and had a fine manor house built for himself in Pennsbury on the Delaware River. But after less than two years, a border dispute with neighboring Maryland forced Penn to return to England.

Back in England, Penn's friendship with the new king, James II, a devout Catholic, was at first a boon, then a liability. Penn was able to use his influence with the king to free from prison hundreds of Quakers and political prisoners. But when the Glorious Revolution of 1688 replaced James II with the Protestant rulers William III and Mary II, Penn found himself under suspicion and was arrested several times. In 1692, Pennsylvania was taken from him and put under royal control. It was restored to him in 1694.

By the time Penn returned to his colony in 1699, it was beset by problems over government and other matters. Penn tried to resolve these difficulties by issuing a new constitution, the Charter of Privileges, creating a one-house elected legislature with greater powers while at the same time reducing the powers of the proprietor and his governor. He also allowed the lower counties (now Delaware) to set up an independent government, united with Pennsylvania only through the governor. Penn also held frequent meetings with Native Americans to make new agreements and foster friendly relations. In addition, he tried to lessen the evils of slavery in Pennsylvania and made a will providing for the freeing of his own slaves at a later date.

Although Penn had hoped to remain in Pennsylvania, within two years' time he was again obliged to return to England. He never set foot in America again. Penn's last years were darkened by tragedy. In 1708, he had to spend nine months in debtors' prison because of his steward's mismanagement of his funds. In 1712, Penn was about to sell his proprietorship of Pennsylvania to the Crown when he suffered a stroke that left him incapacitated. His wife managed his proprietary affairs until Penn died on July 30, 1718, in Buckinghamshire, England.

Pennacooks

Native American group that lived within present-day New Hampshire along the Merrimack River watershed and around Lake Winnipesaukee. The Pennacooks were prominent participants in New England's early imperial wars. A numerous people before European contact, the Pennacooks were ravaged by the New England pandemics of 1619 and 1633. As a result, they welcomed the English colonists of New Hampshire and Massachusetts Bay as friends and allies. In their weakened state, the Pennacooks hoped that the newcomers might help in the struggle against rival tribal groups, particularly the Mohawks. Enmity between the Pennacooks and the Mohawks predated European movement into New England. However, that intrusion had given the Mohawks new interest in captives and furs, and new weapons in firearms to satisfy it. The two sides fought an ongoing war with each other between the 1650s and 1670s in which the Pennacooks generally fared poorly.

When King Philip's War broke out in 1675, the Pennacooks attempted to remain neutral. This neutrality was sorely tested for at the war's beginning, Massachusetts sent soldiers to burn the Penna-

Woodcut of Pennacook chief Passaconaway the Bashaba, ca. late 1600s. (North Wind Picture Archives)

cooks' principal town (today Concord, New Hampshire) for fear they were hostile. Worse was to come. After the war's conclusion, many natives who had fought for Philip took refuge among the Pennacooks. Massachusetts, concerned by this, asked its northern agent, Major Richard Waldron, to settle the situation. Waldron, under pretext of friendship, invited Pennacook leaders and their guests to his home, then arrested those suspected of participating in the war and sent them to Boston. There they were executed or sold into slavery.

During their wars with the Mohawks, the Pennacooks had frequently relied on the French for aid. But by the 1680s Pennacook amity with the French and dissatisfaction with the English was so strong that when King William's War began in 1689, the Pennacooks abandoned their neutrality and attacked Waldron's estate.

Having cast their lot with the French, they maintained the alliance throughout that war. That bond continued throughout Queen Anne's War (1702–1713), which followed shortly afterward.

The pressure of Mohawk and English hostility in the period 1660–1713 encouraged many Pennacooks to withdraw permanently from their traditional lands. A number moved to Canada. Others opted for Abenaki or Sokoki lands that were more remote from English settlements. By 1713 the Pennacook population of New Hampshire was insufficient to prevent English occupation and settlement of their homeland. Although some Pennacook warriors continued to participate in wars against the English, the age of wholesale Pennacook resistance to New England was over.

Pennsylvania

Mid-Atlantic colony controlled by the English since 1681 and dominated by the Quakers. Pennsylvania was chartered as a proprietary colony in 1681. Its founder, William Penn, secured the charter for Pennsylvania from King Charles II as reimbursement for money loaned the Crown by Penn's father, Admiral William Penn.

Before Penn's charter, the French, the Dutch, the Swedes, and the English all claimed territory currently within Pennsylvania's borders. The Swedes created the first permanent settlement in the region near current-day Wilmington, Delaware. During their rule from 1638-1655, Gov. Johan Björnsson Printz established a capital near present-day Philadelphia on Tinicum Island, where he caused Fort Gottenburg to be erected. In 1655, conflict broke out between the Swedes and the Dutch over control of the Delaware River. As a result, Gov. Petrus Stuyvesant of New Netherland seized New Sweden and made it a part of Dutch territory until 1664, when the English defeated the Dutch and renamed New Amsterdam as New York. The English retained control throughout the colonial period, except for a brief period of Dutch resurgence during 1673–1674. During this time the Duke of York's Laws, created in 1676, established English law and civil government in the region. Lands west of the Appalachians, however, remained in dispute between the French and English until the conclusion of the French and Indian War (1754-1763).

Penn's charter for Pennsylvania extended between Lord Baltimore's lands in Maryland and those of the Duke of York in New York. In 1682, the Duke of York also deeded Penn his claim to present-day Delaware, referred to as the "Three Lower Counties" in colonial records. Delaware remained under the proprietary ownership of, and shared a governor with, Pennsylvania until the American Revolutionary War. It was, however, granted a separate legislature in 1704.

During the colonial period, the proprietor, the deputy or lieutenant governor (addressed as governor), and the assembly governed Pennsylvania. From 1681 to 1683, the colony operated under Penn's First Frame of Government, which was revised in 1683 as the Second Frame of Government. In 1701, this constitution was revised again and called the Charter of Privileges. It remained in effect until 1776. This gave the assembly full legislative powers.

Throughout the colonial period, political disputes were the norm. Quakers dominated the assembly until 1756. They tended to support a policy of nonviolence and thus were often in dispute with the proprietors as well as non-Quaker groups over military support for the colony.

Western frontier inhabitants also vied with interests from the southeastern region and petitioned for better representation in the assembly. The westerners also sought increased protection during the various colonial wars. In considerable measure, Quaker influence in Pennsylvania politics led directly to the colony's extraordinary record in cultivating harmonious relations with Native Americans. Indeed, some natives settled there precisely for that reason. Nonetheless, there was always the potential for conflict between the colonists and Native Americans, especially in the western, less-settled part of the colony.

There was little military action on Pennsylvania soil during the early colonial conflicts of King William's War (1689–1697), Queen Anne's War (1702–1713), and King George's War (1744–1748). However, these conflicts did affect Pennsylvania politics, economics, and culture. The wars alternately stimulated and depressed trade and created new economic opportunities, such as smuggling, piracy, privateering, and military contracting.

The perceived threat of French and Spanish invasion was ever present during the colonial era. To protect against international enemies, all the colonial governments active in Pennsylvania at one time or another erected forts in the region. Early on, the Swedes built blockhouses, such as Fort Mecoponacka, Fort Wiaco, and Fort New Korsholm, in southeastern Pennsylvania. When the English took control, they constructed additional garrisons and forts. Association Battery and the Battery at Atwood's Wharf, built in the 1740s, were directed toward defense of the Delaware River against enemy privateers and warships. Indeed, the river was an important center for shipbuilding, and Philadelphia shipbuilders produced many vessels used in both trade and warfare.

Quaker political influence within the colonial government early opposed support both for military endeavors or even their logistical support. Attempts to create a militia were easily defeated. There was sentiment in other colonies that Pennsylvania was not contributing its share toward colonial defense. Indeed, this came to a head during King George's War when Spanish privateers entered

the Delaware and the colony's government failed to appropriate funds for defense. This lack of action on the part of the authorities led Benjamin Franklin to take the lead in helping to organize a voluntary militia in 1747 in order to meet an anticipated Spanish attack, which, however, never materialized.

Throughout the colonial period, the tolerant attitude of Pennsylvania made it a haven for immigrants from many lands. Chief among them were Germans, who sought to escape both war and religious persecution. Scots-Irish Presbyterians from northern Ireland also settled in Pennsylvania in large numbers, seeking economic opportunity as well as freedom to practice their religion.

Despite the best efforts of Pennsylvania leaders, they were not able to isolate the colony from conflict, and the French and Indian War (1754–1763) had a profound impact on the colony. Indeed, Pennsylvania found itself at the forefront of the war's causes. By the early 1750s, fur traders, settlers, and land speculators in Pennsylvania and Virginia had become intensely interested in lands west of the Appalachians. This was, however, territory also claimed by the French.

Not wanting to let the English steal a march on them and determined to preserve their lines of communication from Canada to Louisiana, beginning in 1753 the French moved forces to the headwaters of the Ohio River in western Pennsylvania in order to lay claim to the disputed territory. When the English realized what was happening, they first tried to persuade the French to leave, and when that did not work, they dispatched forces there. In 1755, British major general Edward Braddock led two regular regiments and provincial forces across western Pennsylvania in an effort to take Duquesne, the French fort near present-day Pittsburgh. This action brought the resignation of several members of the Pennsylvania government. A French and native force of some 800 men ambushed Braddock's much larger force a few miles from their goal and inflicted a humiliating defeat. Braddock was among the dead. Although for a time thereafter, it appeared that western Pennsylvania was in danger of invasion, especially from the French-allied Delawares, the colony came through the war without serious loss.

After the British victory in the war, the Proclamation of 1763 barred further settlement west of the Appalachians. Settlers seeking land ignored the order, however. Before the proclamation had even been promulgated, widespread native resistance to further colonial westward expansion contributed to Pontiac's Rebellion (1763–1764). During the rebellion, Native Americans in western Pennsylvania, the Ohio Valley, and the Great Lakes region attacked British forts and Anglo-American settlements. In Pennsylvania, the natives captured three forts: Venango, Le Boeuf, and Presque Isle. The natives, including many Shawnees and Delawares, also laid siege to Fort Pitt but never managed to take it. Colonel Henry Bouquet led an expedition that culminated in the Battle of Bushy Run (August 5–6, 1763), where the natives were finally turned back.

A sense of panic, however, encouraged a number of ruffians, known as the Paxton Boys, to murder a number of peaceful Con-

estoga natives living among the settlers. Then, in January 1764, the Paxton Boys threatened to march on Philadelphia, with the objective of seeking out 140 Delaware converts who had taken refuge there. In the end, the Paxton Boys were dissuaded from the attempt, largely because of Franklin's successful effort to raise a sufficient force to confront them, but the militants were also allowed to disband without threat of prosecution.

The vicissitudes of war affected Pennsylvanians in varying ways. Restrictions on trade brought devastating economic losses to some. Indeed, the numbers of poor residents increased throughout the era and inspired a number of civic responses to care for the indigent. Others, however, greatly profited. Tradesmen involved in the manufacture of war supplies, traders who dealt in wheat, corn, and other agricultural products, and producers of manufactured goods benefited from supplying provisions.

Illegal trade also helps explain the rise in a number of fortunes during the wars. Skirting embargos to provide restricted goods brought great reward to many. By the eve of the American Revolutionary War, Pennsylvania had become the third largest English colony in America. Indeed, Philadelphia was the largest English-speaking city apart from London.

Pennsylvania became a hotbed of political agitation. It was one of the first colonies to support resistance to the Stamp Act in 1765 and among the first to provide assistance to Boston in opposition to the Coercive (Intolerable) Acts in 1774. Pennsylvania's political and geographical importance is reflected in the Continental Congresses held there during the American Revolution.

Pensacola (Florida)

Spanish outpost situated on Pensacola Bay, an inlet of the Gulf of Mexico 13 miles long by 2.5 miles wide in northwestern Florida. Founded in November 1698, Pensacola became a focal point of imperial rivalries over control of the Gulf of Mexico. A relatively isolated military post among sandy pine barrens, it failed to attract many civilian settlers. Indeed, Spain was forced to resort to convict labor in the early years. Pensacola did not produce its own food, although it did export tree trunks for ship masts. Its chief raison d'être was as a base to secure control of the gulf for Spain.

Spain's first failed effort to settle the site, led by Tristán de Luna y Arellano, occurred in 1559–1561. French explorer René-Robert Cavelier, Sieur de La Salle's, interest in the gulf drew Spain's attention back to the area in the 1680s. In 1689, Admiral Andrés de Pez argued that Pensacola would be a more valuable post than St. Augustine. Then, in the 1690s, when English movement inland from Carolina threatened France's trading activities in the Mississippi River Valley, the French formulated plans to create their own outpost on the Gulf of Mexico.

Learning of the French intentions, Spanish officials preempted them in 1698 with the construction of the Presidio Santa María de Galve. Its centerpiece was Fort San Carlos de Austria, situated on a bluff overlooking Pensacola Bay. Finding the Spanish already established at Pensacola in January 1699, the French moved on to establish outposts at Biloxi Bay and the Mississippi Delta.

The initial Spanish garrison at Pensacola was 300 men, but at times it was as few as 80. In 1700, before Spain and France came to blows over the gulf, a French Bourbon, Philip V, ascended the Spanish throne and France and Spain became allies. In Queen Anne's War (1702–1713, the War of the Spanish Succession in Europe), English Carolinians and Creeks attacked Pensacola overland twice, in 1707 and 1711. Although these assaults destroyed the settlement, they failed to take the fort. Attacks from English settlers in Carolina and the Creeks on the Apalachee mission province to the east served, however, to isolate Pensacola from St. Augustine and rendered the Spanish fort dependent on the new French post at Mobile.

After the war, Franco-Spanish cooperation cooled. Confronted with the cost of rebuilding, the Spanish authorities considered simply destroying the fort. In the end, they left a small detachment to maintain the right of possession.

France and Spain found themselves on opposite sides of the War of the Quadruple Alliance (1718–1721), which in North America focused on Pensacola. The site was seized by the French, taken back by the Spanish, and recaptured by the French, all in 1719. During their brief possession of the site, the Spanish built a stockade, Fort Príncipe de Asturias, on Santa Rosa Island, which commanded the main channel entering the bay. They also erected a stockade protecting the land approach to San Carlos de Austria. Peace negotiations were stalled until France agreed to end its occupation of Pensacola. The peace treaty of March 27, 1721, returned Pensacola to the Spanish.

View of Pensacola, Florida, in the 1770s. (Library of Congress)

The Spaniards abandoned the main sites, now mostly burned, and built a new town and fort (Presidio Isla de Santa Rosa) on Santa Rosa Island. A hurricane in 1752 forced the removal of the settlement and garrison back to the mainland, although by 1757 the new stockade (San Miguel de Panzacola) had not yet been completed. There were at the time 150 soldiers and 25 civilians in residence.

The 1763 Treaty of Paris, ending the French and Indian War (1754–1763), granted Florida to Great Britain, and all but one of the Spaniards at Pensacola departed for Mexico. The British made Pensacola a center for Native American trade and the administrative center of West Florida. They also built a stone fort, Fort George, in 1779, and a number of redoubts.

Spanish forces seized Pensacola in 1781 during the American Revolutionary War, and many of the British residents fled. The 1783 Treaty of Paris, which ended the American Revolutionary War, ceded Florida back to Spain, but few of the former Spanish residents returned. Pensacola remained the capital of West Florida in name but was in practice dominated by the Spanish governor general in New Orleans.

Pensacola, Attacks on

Event Date: 1707

Raids associated with Queen Anne's War (1702–1713, also known as the War of the Spanish Succession). In 1698, Spain established a fort at the harbor of Pensacola Bay in present-day Florida in response to rumors that the French and the English were pursuing colonial settlements in the Gulf of Mexico region. The next year the French established a settlement at Mobile, less than 60 miles west of Pensacola. Each too weak to eliminate the other, these two settlements maintained an uneasy truce.

The situation changed in 1700, however, when the Spanish throne passed to a member of the French royal family, who became king of Spain as Philip V. With France and Spain now united under the Bourbon family, the fledgling settlements at Pensacola and Mobile became allies. The stronger settlement at Mobile repeatedly sent assistance to Pensacola to provide a buffer against the English.

Threatened by the new Franco-Spanish alliance, the English colonists carried out sporadic attacks against Spanish settlements throughout Florida. Most notable was the 1702 siege of St. Augustine and a series of attacks on Spanish missions. In response, the Spanish and French launched a joint assault against Charles Town (present-day Charleston, South Carolina) in 1706. The preemptive strike was intended to dislodge the English from Carolina, thereby allowing Spanish settlements in Florida to flourish without fear of harassment.

The assault was very poorly planned. To compound matters, the English governor received advance word of the attack. In consequence, the Spanish attack failed. It also had the negative effect for the Spanish of strengthening British resolve to secure a foothold in Florida.

The British now began planning an assault in conjunction with their Creek allies against Pensacola, to take place in early 1707. The governor of Mobile, Jean-Baptiste Le Moyne de Bienville, however, had excellent relations with the local natives and learned from them of the English plan. He then sent a warning to Pensacola's governor, Joseph de Guzmán, who inexplicably ignored the warning.

The English attack occurred in the summer of 1707. In the process, the English and their native allies sacked and burned the town, while the inhabitants fled to the presidio. Although the attackers briefly breached the presidio's walls, the Spaniards eventually drove back the assault. Eleven Spaniards died in the fight, while another 15 were taken prisoner.

The English planned a larger attack for November 1707. Once again, the French warned Guzmán of the impending attack and promised to send aid when the assault occurred. This time, Guzmán took heed and prepared the garrison accordingly. The English attacking force numbered 12 Carolinians and 350 Creek warriors. On the attackers' arrival, the Spaniards retreated to the presidio, and the English settled in for a prolonged siege.

The attacking forces suffered from internal dissension, and most of the Creek warriors deserted on learning of the approach of French reinforcements. When these did arrive under Bienville on December 8, the remaining English and native forces had already fled. Although intermittent English raids on Pensacola continued in the following years, Spanish control was not again seriously threatened until 1718.

Pensacola during the War of the Quadruple Alliance

Start Date: 1718 End Date: 1720

In 1718 Britain, France, Holland, and Austria created the Quadruple Alliance in an attempt to check the growing power of Spain. This friction between the European powers had consequences in Florida, where Spain and France struggled for control of the territory surrounding the Gulf of Mexico.

The Spanish settlement at Pensacola had been vulnerable since its founding in 1698. In fact, the Spanish had frequently relied on assistance from their French allies in nearby Mobile to defend that post from English assault. With the creation of the Quadruple Alliance, the tentative partnership between Spain and France was broken.

Immediately on hearing of his nation's declaration of war on Spain in January 1719, the French governor of Louisiana, Jean-Baptiste Le Moyne de Bienville, launched an expedition of three ships with 300 soldiers to capture Pensacola and its adjacent harbor. If France could gain control of Pensacola, it would dominate the Mississippi River Valley and the northern Gulf of Mexico.

It is probable that Pensacola's governor, Juan Matamoros de Ysla, was unaware of the declaration of war between France and Spain. In any case, when the French force arrived in Pensacola Bay on May 14, 1719, it easily secured the surrender of the battery guarding the bay. Entering the harbor, the French fired only a few shots at the presidio before the Spanish offered to surrender.

Matamoros was viciously criticized for his failure to mount a serious defense of the presidio, although it is apparent that he lacked the provisions and manpower needed to defend it against a well-planned assault. Matamoros did succeed in negotiating generous terms for his soldiers, who were promised safe transportation to

Cuba aboard French ships. When these ships arrived at Havana, however, Spanish general Gregorio Guazo Calderón refused to recognize the French flag of truce. He even refused to acknowledge the existence of a state of war between Spain and France. Instead, he captured the French ships and made the sailors prisoners of war. Calderón had been preparing to attack the British at Charles Town (present-day Charleston, South Carolina), but on learning of the capture of Pensacola, he diverted his ships to Florida.

On taking possession of Pensacola, the French found the defenses at the presidio in deplorable condition. As a result, they stood no chance against the Spanish counterattack launched on August 6, 1719. With 12 ships and 1,800 men, the Spanish retook Pensacola with little difficulty. Ninety of the French soldiers deserted to join the Spanish, and the remaining 200 Frenchmen were sent to Havana.

The Spanish had long resented the French presence in the Mississippi River Valley, and they now sought to mount a larger campaign against the French at Mobile, Dauphin Island, and the recently established New Orleans. The Spanish attempted to capture Dauphin Island, but when expected reinforcements from Mexico failed to arrive they withdrew.

Meanwhile, the French were preparing a second assault on Pensacola. They planned to launch their attack before the Spanish could rebuild the presidio's dilapidated fortifications. A French naval expedition of five warships subsequently set out for Pensacola. Arriving there, they engaged Spanish ships in an intense three-hour battle in Pensacola Bay on September 17, 1719. The Spaniards ran out of ammunition, and were again forced to surrender. The Spanish soldiers were then taken to France as prisoners of war. The presidio at Pensacola, already in terrible condition, was further damaged when the French allowed their native allies to pillage the town and fort.

By 1720, tensions between Spain and its European enemies had eased and serious peace negotiations were in progress. It was clear to the French diplomats that Spain would insist on the return of Pensacola before a truce could be reached. Although Pensacola had proved difficult to defend, its prime harbor and strategic location made it a prize Spain refused to relinquish. Accordingly, on November 26, 1720, the French renounced their claim to Pensacola as part of a larger peace treaty with Spain, however, formal transfer did not occur until two years later. Spain retained control of Pensacola until 1763, when it ceded control of Florida to the British.

Pepperrell, Sir William, Jr.

Born: June 27, 1696 Died: July 6, 1759

Prominent New England merchant and Massachusetts government official, known for his command of the New England forces that captured the French fortress at Louisbourg during King George's War (1744–1748). Born on June 27, 1696, in Kittery, Maine (then part of Massachusetts), William Pepperrell Jr. was the sixth of eight children of William Pepperrell Sr. and Margery Bray. The elder Pepperrell built a thriving merchant trade and shipped lumber, fish, sugar, and other goods between ports in New England, Europe, the West Indies, and North Carolina. As he grew to adulthood, the younger Pepperrell became increasingly involved in this business, which he inherited on his father's death in 1734. The business continued to prosper, and Pepperrell expanded it by acquiring large tracts of land and timber.

Even before he gained control of the family enterprises, Pepperrell was well known throughout New England. He was elected to the Massachusetts General Court and in 1727 was appointed to the colony's provincial council, where he served until his death. Pepperrell was also a militia colonel and a judge on the York County Court, becoming chief justice in 1730.

At the beginning of King George's War, Gov. William Shirley of Massachusetts set his sights on seizing the great French fortress of Louisbourg. Situated on Cape Breton Island, Louisbourg served as the center of French privateer activity against New England merchant shipping and guarded the mouth of the St. Lawrence River. Given the paucity of British professional soldiers in the colonies, any operation against Louisbourg would have to be carried out by provincial forces. It was thus natural that a prominent public figure would lead them. Shirley chose Pepperrell to command a 4,000man provincial force from Massachusetts, Connecticut, New Hampshire, and Rhode Island. Pepperrell landed his army on Cape Breton Island on April 30, 1745, and, despite his soldiers' lack of experience, conducted a siege that forced the ill-prepared French garrison to surrender on June 16. The success of the operation owed much to the excellent relationship Pepperrell fostered with British Navy commodore Peter Warren, who had commanded a squadron that assisted the colonial operation.

Following this victory, King George II knighted Pepperell and made him commander of a regular British regiment. He held this post until the regiment was disbanded at the close of the war. In 1749 Pepperrell traveled to England, where he was received by the king.

During the French and Indian War (1754–1763), Pepperrell was authorized to recruit American colonists to serve in a regular British regiment under his command, but poor health prevented him from commanding troops in the field. In recognition of his service to the

Crown, he was promoted in February 1755 to major general in the British Army and, in February 1759, to lieutenant general. Pepperrell died in Kittery on July 6, 1759.

Pequot War

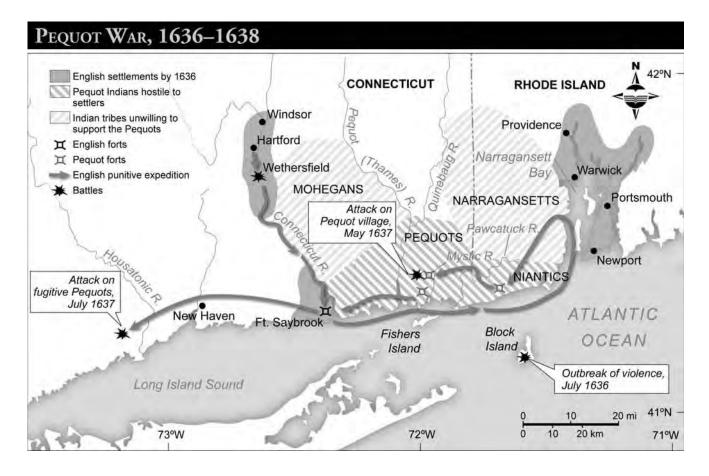

Start Date: July 1636

End Date: September 21, 1638

Conflict between the Pequot people of the lower Connecticut River Valley and the English colonies of Massachusetts Bay and Connecticut, resulting in the near-destruction of the Pequots. The Pequot War grew out of a series of confrontations and growing tensions between the Pequots and English settlers in Connecticut and Massachusetts Bay in the early 1630s. The Pequots and English settlers seemed to be expanding their influence at the same time. The Pequots were growing as a regional trading power just as English settlers extended trading posts and settlements into the Connecticut River Valley. While the Pequots were interested in trading with the English, a few violent incidents quickly changed the tone of interaction.

Contemporary engraving of the colonial attack on the Pequot's Mystic Fort in May 1637. Of 400–700 Pequot inhabitants of the village, only 7 were taken alive. Reportedly, another 7 escaped. (Library of Congress)

In the spring of 1634, a Virginia merchant, John Stone, was exploring the Connecticut River area for trading prospects on a return voyage from Massachusetts. Stone apparently provoked the Pequots and they or a subordinate tribe killed Stone and his crew. Because the Pequots were then embroiled in conflict with the Narragansetts in Rhode Island and eastern Connecticut and the Dutch in New York, they quickly made a treaty with the English. Pequot sachems (chiefs) claimed that Stone had provoked the incident by kidnapping two of the Pequots to serve as guides up the Connecticut River and that, during a Pequot rescue attempt, some powder on board the ship had ignited, destroying the ship. The sachems also claimed that most of the murderers had since died of smallpox, but they agreed to hand over the two who remained. They also agreed to pay a large indemnity of wampum and pelts. Negotiations slowly ground to a halt as Pequot sachems failed to ratify the treaty, thus confirming Puritan notions that the natives were not to be trusted. Only a portion of the tribute was ever paid, but Massachusetts did not pursue the issue.

The negative attitude of Puritan settlers in Massachusetts Bay toward the Pequots was fueled by charges brought by Uncas, sachem of the rival Mohegans, that the murderers of Stone and his crew continued to live among the Pequots. Uncas also reported that the Pequots were planning a preemptive war against the English.

In this increasingly charged atmosphere another English trader was murdered. In July 1636, a vessel captained by John Gallop discovered Captain John Oldham's pinnace adrift off Block Island. Seeing

only natives on deck, Gallop assumed they had taken the vessel. Gallop and his crew attacked the pinnace and retook it at a cost of 10 to 11 Native American dead, and discovered Oldham's body. Because of the proximity of the vessel to Block Island, the government of Massachusetts held the natives there, as well as the Narragansetts, responsible because the Massachusetts leaders believed that the Block Islanders paid tribute to the Narragansetts. The Narragansett sachem, Cannonicus, agreed to return both property and captives taken from Oldham's vessel, but to deflect English anger, he claimed that Oldham's murderers had fled to the Pequots. Subsequently signing a peace treaty with Massachusetts, Cannonicus agreed to help avenge the murders.

The Narragansetts' claims, Uncas's efforts to discredit his rivals, Puritan preconceptions about Native Americans, and the murders of Stone and Oldham all combined to produce a violent response. In August 1636, Massachusetts dispatched a force of some 90 volunteers, led by captains John Endicott and John Underhill, to punish the Block Islanders. Endicott and Underhill had orders to seize the island, kill the men, and take the women and children prisoner. As the colonial force moved ashore, it was immediately assaulted by warriors, who had concealed themselves in the brush. Scattering the natives with a volley, the Massachusetts volunteers searched the island, but failed to come to grips with the warriors, who had taken refuge in a swamp.

Following two days of pillaging and burning the villages they encountered, the English expedition set off for Pequot territory. There Endicott demanded the extradition of Oldham's murderers,

payment of 1,000 fathoms of wampum, and hostages. Meanwhile, the Pequots quietly evacuated their women and children. Misunderstanding or refusing the English demands, the Pequots then refused to do battle. Again unable to bring the natives to decisive battle, the English turned on the Pequots' village, burning wigwams and corn. Having suffered no casualties itself, the expedition then returned to Massachusetts Bay.

The Pequots responded to this Massachusetts attack by raiding settler communities in the Connecticut River Valley. Fort Saybrook, at the mouth of the Connecticut River, came under intermittent siege for the better part of a year. Soon after the Endicott expedition, soldiers gathering corn outside of the fort in preparation for possible Pequot attacks were set upon, and the Pequots captured and subsequently tortured to death two men.

On February 22, 1637, Fort Saybrook itself came under attack. Lieutenant Lion Gardiner and nine men were clearing a wooded area to provide better fields of fire, when several hundred Pequots attacked, killing three of the soldiers. The Pequots also struck undefended settlements along the river. Most notable was the attack on Wethersfield, Connecticut, on April 23, 1637, in which nine English inhabitants died. The Pequots also captured two young women.

Fearing the English response, the Pequots attempted to enlist the support of neighboring native nations. The Mohegans under Uncas, enjoying their influence with the English, spurned overtures of alliance, while the timely intervention of Roger Williams, the banished Puritan minister, prevented the more powerful Narragansetts from siding with the Pequots.

The Pequots had been right to fear retribution. Both Massachusetts Bay and Connecticut approved raising troops for expeditions against the Pequots. Assuming command of the Connecticut forces, Captain John Mason led a force of 80 soldiers and 80 Mohegans under Uncas. The expedition stopped at Fort Saybrook before moving on to Pequot territory, where Gardiner questioned Uncas's loyalty. To prove their allegiance, the Mohegans killed four Pequots seen lurking in the fort's vicinity and captured another.

At this point Captain John Underhill and 20 Massachusetts militiamen joined Mason, replacing a number of wounded Connecticut soldiers. Mason then discussed with his officers the expedition's goals. The Connecticut General Court had ordered him to attack the Pequots at the mouth of the Pequot River (today the Thames River). Mason was certain that the Pequots, who were far more numerous than his own force, would be watching the river and repel any frontal

assault. He thus proposed sailing farther east and marching overland through Narragansett territory, flanking the Pequots. Several of Mason's officers opposed the plan, but after the expedition's chaplain averred that God was in agreement with it, the expedition proceeded.

Sailing past Pequot Harbor, Mason and his force arrived in Narragansett Bay. There Mason convinced Narragansett sachems Miantonomo and Cannonicus to support his efforts. They supplied both guides and warriors, most of whom deserted before the battle.

On May 25, 1637, Mason's force approached the smaller of two Pequot forts on the Mystic River. At daybreak on May 26, Mason moved in, positioning his men in a circle around Mystic village, with his Mohegan and Narragansett allies in a second, outer ring. Detected by dogs, the Englishmen acted quickly, firing through the palisade and storming the village's two entrances. As the Pequots responded, Mason feared being overwhelmed. Ordering a retreat, his men blocked the two gates and, with the aid of gunpowder, torched the wigwams. The two rings of soldiers and warriors prevented most Pequots from escaping. Of an estimated population of 400 to 700 Pequots, only 7 were captured alive and a reported 7 escaped.

Despite this overwhelming victory, Mason was deep in enemy territory and had some 20 of his own men wounded. He was also perilously close to a larger Pequot village. Indeed, some 500 Pequots converged on Mason's men as they marched to a rendezvous with their boats, seven miles distant. Although the warriors harried the English for most of this distance, frequent volleys of musket fire prevented them from overrunning the small English force.

The so-called Mystic Fort Fight largely broke Pequot resistance. Massachusetts forces led by Captain Israel Stoughton, assisted by Narragansetts, pursued the surviving Pequots through the summer of 1637. These forces ultimately captured more than 100 Pequot women and children and executed more than 20 warriors. The fighting effectively ended in July, when a large number of Pequots were surrounded in a swamp near modern-day New Haven.

The Treaty of Hartford, signed on September 21, 1638, officially ended the Pequot War. With it the Pequots ceased to exist as an independent people. The Mohegans, the Narragansetts, and the Eastern Niantics absorbed the surviving Pequots in return for paying an annual tribute to the English. The decimation of the Pequots shifted the balance of power from New England's natives to the English. The war also demonstrated to the English that European methods of warfare could be successful in America, particularly encirclement and the use of Native American allies.

Pequots

Algonquian group that inhabited southeastern Connecticut, centered around present-day New London, between the Pawcatuck River and Niantic Bay. At the height of Pequot dominance, the Pequots' territory encompassed nearly 2,000 square miles.

The Pequots dominated the area for many years before—and for a short time after—the appearance of the Europeans. Many natives in the Connecticut River Valley paid tribute to the Pequots, and their military dominance is best illustrated by their Algonquian name, which translates as "destroyer." Only five years after their first sustained contact with white men, the Pequots were nearly exterminated by disease and the Pequot War (1636–1638) at the hands of the English and their Native American allies.

The Pequot livelihood centered on agriculture, foraging, trade, hunting, and fishing. The Pequots lived in small, dispersed familial villages of 10 to 20 dwellings each. These villages were not stationary but were relocated throughout the year, allowing the Pequots to follow seasonal changes that affected the availability of game, fish, and crop cultivation. In the summer months, the Pequots lived near the coast and planted, hunted, and fished. In the winter, they moved inland, taking with them as much food as possible gathered in the summer. For subsistence in the winter, they depended on hunting and stores from summer and fall plantings.

The Pequots were led by a sachem (chief, or *sagamore*), a patrilineal position in that the office was held by men who were related. However, female sachems were not unknown. A council of elders composed of prominent warriors and other notables advised the sachem. The sachem ruled through persuasion and the granting and receiving of gifts.

The arrival of Europeans to the region and their eventual penetration into the Connecticut Valley presented the Pequots with new rivals to their dominance in the region. Unfortunately for the Pequots, the European confrontation occurred at a most inopportune time. The Pequots, like most Native Americans, were decimated by disease. Two outbreaks of European diseases in 1616–1619 and 1633 occurred just as the Pequots were confronting the brunt of European incursions onto their lands.

The Puritans in Connecticut and in Massachusetts Bay chose to regard the Pequots as little more than bloodthirsty savages. This view helped precipitate the tragic Pequot War in 1636. The English allied with the Pequots' enemies, the Narragansetts and the Mohegans, to destroy the Pequots and nearly succeeded in their aim.

According to some estimates, the Pequot population numbered 13,000 people just before European contact. By 1636 the population had fallen to 3,000, however. At the conclusion of the Pequot War, fewer than 1,000 Pequots remained. The great majority of these were sold into slavery or forced to live under the control of neighboring tribes. The Pequots almost disappeared, but they managed to survive and now occupy reservations in Connecticut.

Pettaquamscutt Rock, Treaty of Event Date: July 15, 1675

Treaty signed by the Narragansetts and Massachusetts Bay colonists on July 15, 1675. The agreement is also known as the Narragansett Treaty of 1675. Although the treaty was designed to guarantee the neutrality of the Narragansetts during King Philip's War (1675–1676), it quickly unraveled.

The Narragansetts, who were for the most part situated in southern Rhode Island, were the most powerful Native American nation in the New England region. In July 1675, a body of heavily armed English colonists coerced them to sign the Pettaquamscutt Rock Treaty. The English feared that the Narragansetts might join their neighbors in raids on English settlements. In order for them to prove their loyalty, the English demanded that the Narragansetts surrender any Wampanoag warriors captured on Narragansett land. Further, the English demanded four hostages from the natives as a sign of good faith.

Differing concepts of the terms led to confusion, however. The Narragansetts assumed that the hostages would be released in exchange for Wampanoag captives. Such was not the case. Colonists and Narragansetts also interpreted the term "neutrality" in different ways. Thus, when the Narragansetts did not closely confine Wampanoags and immediately transfer them to English control, the colonists decided that the Narragansetts were in violation of the treaty. They then proceeded to launch a punitive expedition against

a major Narragansett settlement. In the ensuing Great Swamp Fight of December 19, 1675, 600 or more Narragansett villagers were killed and 300 others were taken prisoner. The unprovoked attack drove the Narragansetts into an alliance with King Philip's Wampanoags. It also was a major blow to the survival of the tribe.

Pez, Andrés de

Born: 1657

Died: March 9, 1723

Spanish explorer, naval officer, and governor of the Council of the Indies (1717–1723). Andrés de Pez was born in Cádiz, Spain, sometime in 1657 and joined the navy when he was 16. In 1676, at the Battle of Palermo against the French, he witnessed the deaths of his brother and father. The tragedy engendered in him a lifelong hatred of the French. Early in his career, Pez served as a naval guard on vessels sailing between Spain and the Americas. In 1686, he was promoted to commandant of the presidio at Veracruz, Mexico.

During the 1680s, the French were the chief threat to Spain's territorial empire in the Caribbean and the Gulf of Mexico. French explorer René-Robert Cavelier, Sieur de La Salle, had dreams of establishing a sprawling French empire in the New World in the Mississippi Valley. Pez, now a captain, participated in the search for the French explorer's colony on the Texas coast during 1687–1688. In March 1688, Pez explored the Gulf Coast from Mobile Bay to the mouth of the Mississippi River. That August he explored the Rio Grande. After locating La Salle's colony in Texas in 1689, Pez returned to Spain to report the find to the Spanish government.

While in Spain, Pez was awarded the Order of Santiago and obtained permission to explore the coast around Pensacola, Florida, the site of Tristán de Luna y Arellano's failed colony. In 1693, Pez conducted a scientific exploration that mapped the coastal regions around Pensacola. Ultimately, this expedition resulted in the reestablishment of the colony at Pensacola in 1698.

During the 1690s, Pez commanded the Armada de Barlovento, the fleet that guarded Spanish ships in the Caribbean and the Gulf of Mexico. In 1717, he became governor of the Council of the Indies, which oversaw colonial governance. In 1721, the Spanish Crown appointed him secretary of state for war and marine. He also continued to serve as the council governor. As secretary, Pez argued that

Spain should firmly resist French territorial ambitions in the Mississippi Valley and along the Gulf Coast. Pez died in Madrid on March 9, 1723.

Philip II, King of Spain

Born: May 21, 1527 Died: September 13, 1598

Spanish monarch from 1556 until his death in 1598, and king of Portugal by conquest from 1580. Philip II was born at Valladolid, Spain, on May 21, 1527, the only son of Holy Roman Emperor Charles V and Queen Isabella of Portugal. Philip was tutored in Latin, French, and the sciences and showed keen interest in music, art, and architecture.

In 1554, for purely political purposes, the already widowed Philip married Queen Mary I, the Catholic monarch of England. When his father abdicated in 1556, Philip ascended the throne of Spain. Shortly thereafter, the new king became convinced that his own son, Don Carlos, was conspiring against his rule and ordered him imprisoned. Don Carlos died while in custody, and many at the time believed that Philip had his son poisoned, though there is no hard evidence to support the theory.

Spain saw some of its greatest triumphs and deepest defeats during Philip's reign. A capable monarch who was well acquainted with what was transpiring in his far-flung empire, Philip ruled by reliance on the information presented by his many royal councils. Each one oversaw a different region of the realm. In the New World, the Council of the Indies ruled supreme.

During Philip's reign, Spain conquered the Philippines (which were named after him), opening a valuable trade route with the East. Spanish holdings in the New World also reached their zenith, so that by 1590, Spain either ruled over or claimed almost all of the Americas. In 1580, when Philip became king of Portugal, more holdings were added, which included Brazil, a toehold in China, Mozambique, Angola, Goa in India, and the Spice Islands.

Philip's reign also saw much controversy. A fanatical Catholic, he launched Spain on a great crusade against the Muslim world and Protestantism and with grim persistence poured the treasure of his kingdom into this effort. Military campaigns and imperial over-

King Philip II of Spain. During his long rule from 1556 to 1598, Philip poured much of the treasure of his far-flung empire into a great crusade against Protestantism. (Library of Congress)

stretch greatly strained the royal treasury to the point that taxes became burdensome and antipathy among the wealthy and nobles increased. Philip was forced to repudiate Spanish debts no fewer than four times during his reign.

Spain conducted a longstanding war against the Auracanians of Chile, while Pedro Menéndez de Avilés consolidated Spanish power in Florida by founding a permanent garrison at St. Augustine, on Florida's northeast coast. Meanwhile, Spain had to fend off French designs on Brazil and Florida, and English incursions along the coast of North America. Although Philip's forces were victorious over the Turks in the great naval battle of Lepanto in 1571, he had less success against the Protestants of northern Europe. Perhaps the most famous, or infamous, setback for his policies occurred in 1588. In retaliation for England's meddling in the ongoing revolt against Spanish rule in the Netherlands and English actions against Spanish shipping on the high seas, Philip prepared an invasion of England. He hoped to oust Queen Elizabeth I, a Protestant, and assume the English throne himself.

After some setbacks occasioned by an English preemptive strike on Cádiz, Philip launched the supposedly invincible Spanish Armada to invade England. It met ignominious defeat at the hands of the English Navy and the weather (the famous "Protestant Wind"). Perhaps only half of the ships returned to Spain. This event marked the beginning of the decline of Spain as a great power

and the rise of England. Philip died at Escorial, Spain, on September 13, 1598.

Phips, Sir William

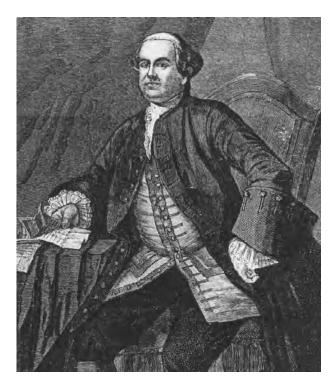

Born: February 2, 1651 Died: February 18, 1695

British mariner, military leader, and first royal governor of Massachusetts (1692–1694). William Phips was born on February 2, 1651, in Woolwich, Maine (then part of Massachusetts). The younger son of a family of farmers and fur traders on the Maine frontier, Phips moved to Boston as a teenager. There he pursued a maritime career. During the 1680s he received several royal commissions to search for sunken treasure ships around Bermuda and the Caribbean. In 1685, his efforts paid off when he located a Spanish wreck off the coast of Hispaniola. The grateful King James II knighted Phips for his service, and the humble mariner instantly gained a place among London's high society.

In the late 1680s, Phips used his status to gain entry into New England politics. He befriended Boston minister Increase Mather, and when Mather's faction seized power in the wake of the Glorious Revolution of 1688–1689, Phips became a magistrate. The Massachusetts Assembly then commissioned him to lead the first English assault against the French in King William's War (1689–1697). Phips, now a major general, raised a fleet to attack the Acadian capital of Port Royal, which he captured without resistance on May 10, 1690. Phips violated the terms of surrender, however, by imprisoning the French governor and allowing his men to loot the town. While this enraged the French, it delighted both his men and sponsors in Boston.

In the wake of this success, the legislature chose Phips to lead a far more ambitious assault on Quebec. He subsequently led a fleet of 34 vessels and 2,300 men up the St. Lawrence River toward the capital of New France. Concurrently, New York and Iroquois forces were to mount a land expedition against Montreal. The land forces never reached their destination, however. Phips's fleet, acting without river pilots, took two months to reach Quebec, by which time the French governor, Louis de Buade, Comte de Frontenac, had had ample time to prepare. Following a three-day assault on Quebec in mid-October doomed by bad weather, disease, and questionable tactical decisions, Phips withdrew his force. This decision led to a widespread negative reaction in Boston and in London.

Despite this disappointment, Phips secured appointment as the first royal governor of Massachusetts under a new charter in 1692. He

arrived in the midst of the infamous Salem Witch Trials but devoted most of his attention to securing the colony's northern frontier against French and Native American enemies. He rebuilt the fortification at Pemaquid, Maine, and signed a peace treaty with the Abenakis in 1693. Nevertheless, Phips made many enemies as governor, and several high-profile charges led to his recall to England in late 1694. Phips died in London on February 18, 1695, soon after his arrival.

Pickawillany Massacre

Event Date: June 21, 1752

Devastating French attack on a fortified British fur-trading post and Miami village on June 21, 1752. Some consider the assault to have been the first battle of the French and Indian War (1754–1763). The westernmost British commercial post in the early 1750s, Pickawillany was located on the Great Miami River in present-day western Ohio.

Piankeshaw/Miami chief Memeskia (Old Briton) first settled his people at Pickawillany in 1748. The tribe had cooled in its loyalty to the French during the 1740s. The site eventually attracted some 50 British commercial agents, including Pennsylvanian George Croghan, whose commercial ventures were so successful the French put a price on his head. The English traders engaged in a brisk business with the natives, primarily in beaver, deer, bear, fox, and raccoon pelts in return for manufactured products. By 1751, Pickawillany, then home to as many as 400 native families, threatened the French fur trade as well as their western military posts.

In 1749, French captain Celeron de Blainville had warned the native peoples at Pickawillany of the dangers of an alliance with the English traders. The residents failed to pay heed. The French threats did, however, lead Pickawillany's traders and natives to fortify the post with a log stockade by 1750.

Several years of confrontation in the region led to the French decision to send an expedition to destroy the settlement at Pickawillany in June 1752. French commander Ensign Charles Michel Mouet de Langlade led a few dozen French militiamen from Detroit, along with some 200 allied Ottawa, Potawatomi, and Ojibwa warriors under Chief Pontiac, in an expedition against Pickawillany. Langlade and Pontiac attacked the village early on the morning of June 21, when most of its defenders were away hunting. The attackers burned the village to the ground.

The French and their allied native forces then plundered and destroyed the site. Memeskia, 13 of his followers, and a single English trader were killed. Allegedly, Memeskia was ritually eaten after his death by his native enemies. Several British traders were taken captive and sent to Detroit.

The British could no longer claim the trans-Appalachian West by right of occupation. Their influence now waned among most Ohio native villages, many of which chose to side with the French in the approaching French and Indian War. The fort at Pickawillany was never reoccupied.

Pike

Poled weapon. The pike was the longest polearm and was widely employed in the late Middle Ages and early modern period. In 17th-century Europe in particular, the pike was employed when massed pikemen protected musketeers against cavalry attack, especially while the musketeers were reloading. The standard length for the spear-shaped pike was 16 feet, or as long as the *sarissa* employed in the Macedonian phalanx during the fourth century BC. Some pikes were as long as 22 feet; others were shorter than 16 feet, cut down by the soldiers who wielded them to make them easier to carry. The head of the pike was of iron, but owing to its great length, its shaft was of a strong wood, often ash, reinforced with two steel strips down the sides.

Pikes were inexpensive to make, and soldiers required little training in their use, but their great length made them unwieldy in close combat. As a consequence, pikemen often carried swords to use if their ranks were broken. Pikes were employed en masse, in large "hedgehog" phalanx formations, the pikes projecting in the direction of an anticipated cavalry attack. Cavalry was the offensive arm, whereas pikemen were the primary means of defending against cavalry. The pike reached its greatest effectiveness in the Spanish *tercio* formation, which employed pikemen in the center and *arquebusiers* on the flanks.

The pike proved unwieldy and ineffective in the woodlands of North America and was soon largely discarded there. It remained in service in Europe until the advent of the bayonet and the improving effectiveness of the musket. A bayonet attached to the muzzle end of a musket made every musketeer his own pikeman. Pikes survived only as symbols of authority and were often used to carry regimental colors.

Pilgrims

English religious separatists who helped settle the colony at Plymouth beginning in 1620. Americans commonly, but inaccurately, apply the label "Pilgrim" to all early Plymouth colonists. In reality, the Pilgrims composed less than half of the original settlers. They were a congregation of radical religious dissenters called Separatists who held irreconcilable differences with the Church of England. First migrating in 1608 to a more tolerant environment in Holland, the Pilgrims opted to leave the Netherlands in 1620 and immigrate to the New World. Before the Pilgrims departed, the

The Pilgrims, members of Plymouth Colony, hold their first meeting for public worship in North America, January 21, 1621. (Library of Congress)

Rev. John Robinson, the spiritual leader of the group, recruited Myles Standish, an officer in the British Army, to serve as the colony's military adviser.

After two aborted starts, the Pilgrims abandoned the smaller of their two ships, the leaking *Speedwell*, at Dartmouth, England, and boarded its companion, a 180-ton cargo ship dubbed the *Mayflower*. In addition to the crew, the 102 passengers included 50 men, 19 women (3 of whom were pregnant), 14 teenagers, and 19 children under the age of 13. Twenty-eight out of the 69 adults were "saints," or members of the congregation. They wanted to reach the northern regions of the London Company's Virginia settlements that were near enough to the established colony for security, but far enough away to avoid persecution.

On November 11, 1620, after 66 days at sea and severe weather that blew the ship off course, the *Mayflower* anchored off the coast of present-day Provincetown, Massachusetts. Forty-one male passengers on board the ship signed the Mayflower Compact, creating a civil government for the colony. Christopher Jones, the ship's captain, and Standish immediately oversaw a reconnaissance of Cape Cod and, by mid-December, selected the former

Native American village of Patuxet as a site for settlement. Diseases introduced by European traders had wiped out Patuxet's inhabitants years before.

During the first difficult winter at Plymouth, only 7 colonists remained untouched by ill health. Most of their ailments originated during the voyage across the Atlantic. By March 1621, sickness and starvation had claimed 50 of the original 102 colonists.

Anxiety grew over both the ever-diminishing number of settlers and the expectation of trouble with the native population. Tensions subsided, however, when Ousa Mequin (Massasoit), the grand sachem (chief) of the nearby Wampanoag Confederacy, forged an alliance with John Carver, the first governor of the colony. Mutually beneficial, the treaty provided security for the Pilgrims and military aid for the Wampanoags in case of hostilities with their traditional adversaries, the Narragansetts. The alliance also brought Wampanoag goodwill to the starving colonists, who learned from their native neighbors how to grow corn and where to fish.

In November 1621, more ships began to arrive at Plymouth Harbor, bringing supplies and additional settlers (few of whom were "saints," however) to the environs around Plymouth. The colony's

population had swelled to some 150 people by 1627. Realizing that there was little profit to be had in cod fishing, the Pilgrims and their non-Separatist cohorts expanded the bounds of Plymouth in search of other means of financial support. Tapping into the lucrative trade in beaver pelts and wampum, the colonists established trading posts on the coast of Maine and on the northern end of Buzzard's Bay at Aptucxet.

The northern trading posts in Maine were problematic, however, as they frequently succumbed to French raiding parties. Aptucxet, on the other hand, facilitated trade southward to the Connecticut River. There, the Pilgrims found themselves embroiled in economic rivalries with the Dutch, the Pequots, and the Mohegans based largely on the wampum trade. When the Pequot War (1636–1638) erupted in the Connecticut River Valley, the Plymouth colonists refused to participate, leaving the Connecticut Colony and the Massachusetts Bay Colony to bear much of the burden of the war.

Although outnumbered by the region's non-Separatist English population that soared during the Puritan migration of the 1630s, Plymouth continued to exist as a separate entity until it was absorbed along with the Massachusetts Bay Colony into the Province of Massachusetts Bay in October 1691. Pilgrim leadership predominated Plymouth society until old age or death removed the last members of the congregation from active roles in the community.

Pima Revolts

Event Dates: 1695 and 1751

Violent uprisings by the Pimas in northern Sonora (Mexico and part of modern-day Arizona) against Spanish rule. The growing volatility of Spanish–American Indian relations on the northern frontier of New Spain resulted in revolts by the Upper Pima peoples in northern Sonora (Pimería Alta) in 1695 and 1751. Throughout the 17th century, Spanish missions and members of the Franciscan and Jesuit orders served as the principal vehicles for the extension of Spanish influence in the northern reaches of New Spain. Accordingly, in 1687, a Jesuit missionary, Father Eusebio Francisco Kino, arrived in Pimería Alta and established a mission at Dolores. The cultural diversity of the Upper Pimas complicated his efforts to broaden the mission system in northern Sonora, however.

The natives living in eastern Pimería Alta inhabited easily accessible small villages, or *rancherías*, and practiced subsistence agriculture. Their western kinsmen, however, led a more nomadic lifestyle. The attitude of most Spanish settlers in central Sonora, who resented the mission program's control of prospective land and labor, was also troubling for the priest. Nevertheless, Kino traveled extensively throughout Pimería Alta baptizing hundreds of natives, winning over converts to the mission program, and encountering little native opposition. By 1693, four missionaries were working in northern Sonora, and the mission system appeared to be functioning well.

Kino's world was turned inside out in 1695, when Pimas at the Tubutama mission fomented a revolt against the Spanish. Growing animosity stemming from injustices suffered at the hands of Spaniards and their Opata cohorts persuaded a faction of Pimas at Tubutama to kill their Opata overseer and 2 other Christian natives. The action sparked an uprising by other mission Pimas, resulting in the death of a young priest at Caborca. Spanish reprisals were swift and deadly. Kino's efforts to work out a peaceful resolution to the problem led to the slaughter of 50 Pimas by Spanish soldiers at El Tupo. Pima leaders had agreed to assemble there under the promise of immunity in order to turn in the guilty parties. However, much to Kino's horror, Spanish soldiers reneged on the deal and went on a rampage. These senseless deaths further inflamed Pimería Alta and led to the destruction of the missions at Tubutama, Caborca, San Ignacio, and Imuris.

Failing to find sizable bodies of Pimas to engage in battle, Spanish forces moved about the countryside killing indiscriminately and destroying Piman crops. Peace and stability returned to the region after Father Kino, once again, convinced Pima leaders to hand over those natives responsible for the murders of the Opata overseer at Tubutama and the priest at Caborca. Following Kino's successful negotiations, the Spanish military turned their attention to Apache raiders and ended the campaign against the Pimas. Peace now returned to Pimería Alta. Nevertheless, the revolts severely shook Kino's missionary program.

When Kino died in 1711, missionary activities in northern Sonora began to decline. Disenchanted Spaniards called for the removal of the Jesuits and the breakup of the mission system. Native lands appeared to be the most fruitful for farming and ranching, but it remained unavailable for Spanish settlement. Despite the colonizers' dissatisfaction with the mission system, revitalization of the Jesuit missions began in 1732. By 1750, nine missionaries were working among the Upper Pimas.

In 1751, a second Pima revolt led to a short-lived but more widespread uprising that succeeded in once again weakening the Jesuit presence in northern Sonora. Luís Oacpicagigua, an overly ambitious Pima from Saric, devised a plan to remove the Spanish presence from Pimería Alta. Beginning with the murders of 15 Spaniards he had invited to his home, Oacpicagigua and his followers killed over 100 Spanish settlers, including the missionaries at Caborca and Sonoita. Although the revolt spread eastward and found collaborators across northern Sonora, it never garnered much support among the general Pima population. The movement began to wane with the arrival of Spanish forces under Captain Diego Ortiz Parillas, who proceeded to kill forty Pimas in retribution. Oacpicagigua's revolt soon lost momentum and collapsed as its leader agreed to negotiations. He and other rebels were subsequently jailed.

Although neither Pima revolt enjoyed overwhelming collaboration among the Pimas of northern Sonora, they each effectively undermined the Jesuit presence in the region. The revolt of 1751, in particular, left the mission system quite weak. Following Spain's expulsion of the Jesuits from all its territories in 1767, Franciscans attempted to continue missionary work among the Upper Pimas, but with little success. The principal vehicles for Spanish conquest in Pimería Alta withered through the remainder of the colonial era.

Pine Tree Hill, Treaty of Event Date: July 1760

Land agreement negotiated between the Catawba Nation and British settlers in North and South Carolina. Before European migration to North America, the Catawbas laid claim to roughly 55,000 square miles of territory. Their land claims stretched from south-central Virginia in the north through central North Carolina east of the Appalachian Mountains and much of South Carolina to the Savannah River. These claims remained relatively secure until the founding of Charles Town (present-day Charleston) in 1670 on the southern coast of South Carolina. From that point on, the Catawbas were under constant pressure from English settlers. The situation grew worse with the settling of North Carolina from the early to mid-18th century.

By 1760, the leaders of both North and South Carolina were eager to negotiate a land cession from the Catawba. Unfortunately, the text of the important treaty, signed in July 1760 by the Catawbas and representatives of the two Carolinas, has been lost. Extensive research on both sides of the Atlantic by historians as well as Catawba tribal attorneys has failed to discover it. Some facts are known about the accord, however. In 1760, the Catawbas, led by King Haigler, agreed to the cession. In it, the Catawba people agreed to cede most of their land claims in both Carolinas, reserving only a tract of some two million acres. In return for signing the treaty, King Haigler received a gold gorget and his queen was presented a silver plate.

Samuel Wyly began to survey these lands immediately after the treaty was signed, but he did not complete the work. Soon North Carolina leaders began to complain that the Catawbas had retained too much land. Complicating matters, King Haigler was killed, allegedly by Shawnee warriors. In 1763, when representatives of the Catawbas traveled to Augusta, Georgia, to attend a conference, they found themselves unable to resist further settler encroachment and felt compelled to agree to the Treaty of Augusta. After 1763, the Catawbas were limited to a reservation of 15 square miles located along the North Carolina–South Carolina border, adjacent to the Catawba River.

Piracy

Piracy, or robbery on the high seas, came in many forms in the colonial period, and the distinction between it and government-sanctioned piracy, or privateering, was often murky. This was especially true in the early years of European maritime expansion, when the laws regulating nations at sea were in their infancy and not widely agreed on.

Without strong naval power, the Dutch, the English, and the French encouraged private raids of Spanish shipping in the 16th century. Even as England's naval power began to eclipse that of the Spanish, the English still had to rely heavily on piracy, especially in the West Indies. By the late 16th century, English leaders began to see piracy as more of a liability than asset. When not waging war against France in the early decades of the 18th century, British imperial officials waged war against pirates. By 1730, the Royal Navy's crackdown had virtually eliminated piracy from most of the Atlantic world.

Although there has been piracy for nearly as long as valuable goods have been transported across water, European colonization of the Americas helped fuel its heyday. Almost as soon as the Spanish began shipping the gold and silver of central Mexico and Peru across the Atlantic, pirates began plundering their ships. In 1523, Frenchmen seized on the Atlantic Ocean much of the gold that Hernán Cortés had acquired through the conquest of Mexico. By the 1550s French pirates were working deep in the Caribbean. They raided and destroyed much of Havana, Cuba, and attacked Spanish ships as they passed between Florida and the Bahamas.

The Spanish, losing significant revenue to pirates, tried to increase security. They began to ship American spoils in heavily protected convoys consisting largely of armed galleons instead of

Pirate Edward Teach, better known as Blackbeard and active in the early 18th century. (Library of Congress)

caravels. They also fortified their position on the North American mainland by destroying the French settlement at Fort Caroline in 1565 and then establishing a series of posts along the Gulf of Mexico and southern Atlantic Coast, including St. Augustine.

Beginning in the 1570s, English pirates began to pose as much a threat to the Spanish as the French. Francis Drake raided Caribbean settlements and even threatened Spanish shipping in the Pacific. His vast accumulation of wealth led Queen Elizabeth I to protect him and honor him with knighthood. It also contributed in part to King Philip II's botched attempt to invade England in 1588, which resulted in the destruction of much of the Spanish Armada. The 1604 peace treaty between England and Spain did little to stem the rise of unofficial pirates, however. Many found refuge in the small harbors of the Lesser Antilles, where they could resupply free from Spanish pursuit.

By contributing to the relative decline of the Spanish, piracy helped pave the way for permanent English colonies. Some pirate outposts in the Lesser Antilles, such as St. Christopher and Barbados, became enduring English colonies, whereas New York, South Carolina, and Jamaica all earned reputations for harboring pirates. After the English seized Jamaica in 1655, the island's proximity to the larger ports and shipping lanes of Spanish America made it an attractive base for pirates. As in many parts of North America, English officials and planters there tolerated and even encouraged the pirates' presence as a bulwark against Spanish attacks.

The most famous pirate of the 17th century, Henry Morgan, worked with Jamaica's royal governor, Thomas Modyford, in a mutually beneficial relationship. Both men lined their pockets as Morgan's pirates plundered seaports of Spanish Central America from 1665 until 1671, when King Charles II recalled the governor and tried to halt Jamaican piracy. Morgan sailed to London and, largely by selectively sharing his loot, managed to secure both a knighthood and the deputy governorship of Jamaica.

Pirates not surprisingly continued to thrive in Jamaica, particularly Port Royal. Though often an unsavory presence, the buccaneers were tolerated by the island's planters for their abilities to counter the Spanish threat and contribute to a bustling economy. But the pirates' true loyalties did not lie with the English, and at times they found it more convenient to attack English ships instead of Spanish. Believing by 1690 that the pirates did more harm than good, the English Crown appointed a new governor who was to expel them from Jamaica.

The heyday of pirates was short lived, and the end of the 17th century proved pivotal in their decline. Temporarily freed from an immediate French threat between King William's War (1689–1697) and Queen Anne's War (1702–1713), England began employing its navy to wage war on pirates. Parliament passed legislation in 1700 that turned governors and merchants into criminals if they assisted pirates. The same governors that had previously patronized pirates suddenly began arresting them. Dozens of pirates were seized and shipped to London for trial and execution. In one of the most celebrated examples, the governor of New York betrayed Captain William Kidd. The governor had supported and profited from Kidd's piracy in the Indian Ocean, but when imperial officials began to crack down, he tricked Kidd into capture and sent him to London, where his corpse would eventually dangle alongside the Thames River as a gruesome reminder of the fate awaiting pirates.

Queen Anne's War temporarily drained naval resources from the war on pirates, and its end in 1713 saw the downsizing of the navy and a glut of mariners. Taking advantage of conditions, ship captains brutally exploited sailors and merchants cut their wages. Unemployment and mutinies fueled growth in the number of pirates until Britain renewed its war against pirates in 1716. More than ever before, imperial authorities had the support of colonial societies. Governors and merchants helped the Royal Navy suppress piracy. Between 1716 and 1726, hundreds of buccaneers were convicted and executed, and many more chose death over capture. By 1730 pirates had been all but eliminated from the North American coast.

Pistols

Pistols were part of the wide variety of individual weapons in use during the colonial era. The introduction of gunpowder into Europe in the 13th century led to a military revolution, and the appearance in the late 14th and early 15th centuries of a wide variety of individual hand "gonnes." Most were larger types that evolved into the musket, but some of these medieval firearms were small enough to be classified as pistols.

The true pistol came about with the introduction of the wheel-lock, which made possible firing the weapon with one hand. The origins of the name "pistol" are obscure but it may have evolved from the term *pistolese*, a dagger made in Pistola in northern Italy, which in France and England was known as a *pistolet*. In any case, the term was in common use in the 1540s.

To load and fire all early handheld firearms, an individual would pour a set amount of gunpowder down the weapon's muzzle, then ram a round ball (usually of lead) after it, seating the ball against the powder charge at the bottom of the breech. The ball was wrapped in a cloth wad to ensure a tight fit between ball and barrel in order to hold the ball next to the powder. The powder charge was ignited by means of a slow-burning match applied to the small hole (touch hole) in the top of the breech end of the barrel over the charge.

The first individual firearms were matchlocks (or firelocks), in which a mechanism brought a match down over the touch hole. The wheel-lock improved on the matchlock; wheel-lock pistols were certainly in use by the 1540s. In the wheel-lock, pressing the trigger caused a cover over the pan containing the powder to slide forward. At the same time iron pyrites known as the spanner, clamped into a cock or dog-head, brushed against a rough-edged wheel as the latter turned, creating sparks that ignited the exposed priming powder.

The snap-lock was the next improvement. Appearing in English pistols by 1580, the snap-lock employed flint and steel for the first time. Pulling the trigger opened the pan cover, while at the same time the cock swung forward, scraping the flint against the face of a piece of upright steel, driving it forward and causing sparks to fall in the exposed pan below.

The final step in the evolution of pistols in the colonial era was the flintlock. By the 1640s, the flintlock pistol had supplanted all other types, save in Spain. The flintlock's firing device was simply a refinement of the snap-lock in which the steel and pan cover were of one piece. The flintlock was a more reliable, simple, and effective weapon than its predecessors. It was also safer and far easier to load.

Flintlock firing followed the following procedure: half-cocking, or placing the weapon on safety (the origin of the phrase "Don't go off half-cocked"); taking out the cartridge and biting off the paper at the top; pouring a small bit of powder into the pan; ramming the remaining powder, paper, and ball down the bore; putting the pistol on full cock; then pulling the trigger to fire the weapon. Pulling the trigger released the lock to strike the flint, producing a spark in the powder pan. The cover or frissen kept the powder dry and prevented it from falling out of the pan; it opened when the flint moved forward. The resulting fire raced through the touch hole into the barrel, touching off the main charge.

The first pistols were used by the military and civilians for personal defense, for hunting from horseback, and above all as a cavalry weapon. The Thirty Years' War in Europe (1618–1648) saw a great increase in pistol production. Pistols were especially favored for the close-in fighting at which cavalry actions occurred and in which accuracy was not an overriding factor. Pistols were also far easier to withdraw from saddle holsters and fire than were muskets. Often cavalrymen carried them in pairs.

Pistols were also popular aboard ship for boarding an enemy vessel or to repel boarders from one's own vessel. Pistols intended for naval use often were designed with a belt-hook, an iron clip on the left-hand side of the stock.

Pistols came to be the favored individual firearm for officers, and they were often used in duels to settle "affairs of honor" among gentlemen of the time. The second half of the 18th century saw the production in England of precisely manufactured dueling pistols, the barrels of which were 9–10 inches in length.

As with muskets, there was no standardization in pistol design in the colonial period. Pistols appeared in a bewildering array of sizes and styles. They generally ranged in caliber (one caliber equaling an inch) of from .45 to .62. Some pistols were as much as .80 caliber, however. Barrel length, at first as long as 20–25 inches, was reduced in the course of the 17th century to 15–18 inches. It continued to decrease over the course of the 18th century. Those pistols with the shortest barrels were known as pocket pistols. They had barrel lengths of up to 5 inches and an overall length of only 7–9 inches. The English light dragoon (dragoons were infantry that rode into battle then fought on foot) pistol that appeared around 1759 had a 9-inch barrel. The heavy dragoon pistol had a 12-inch barrel.

The great majority of pistols were smoothbore weapons. Some English pistols had threaded barrels that could be screwed on and off. The so-called turn-off pistol allowed the gun to be loaded by removing the barrel instead of pushing the ball down the barrel. Such pistols were quite accurate weapons when they had rifled barrels. Screwing the barrel back on pushed the soft lead bullet into the lands and grooves of a rifled barrel and eliminated the need for a patch to hold the bullet in place. Turn-off pistols had the disadvantage of being slow to load, and thus they saw little military use. The

finest type of these turn-off pistols was known as the Queen Anne pistol, which first appeared at the beginning of the 18th century.

Multiple-shot pistols were also manufactured, and blunderbuss pistols with large bores and flared muzzles were used by coachmen for close-in defensive work. Blunderbuss pistols could deliver a large amount of shot over a wide area. The duck-foot pistol was another attempt to deliver a large amount of shot at one firing. It had four barrels positioned so as to resemble a fan or a duck's foot. Some pistols were also fitted with a blade under the barrel or had a blade that came forward on releasing a catch.

Pistol stocks were made of the same hardwoods as long guns. Walnut and maple were standard, with curly maple a favorite. Scottish pistols were often entirely of metal, and had steel, brass, or German silver stocks, often with elaborate engraving.

Pitt, William (the Elder), First Earl of Chatham

Born: November 15, 1708 Died: May 11, 1778

British politician and influential secretary of state for the Southern Department (1756–1761). William Pitt was born on November 15, 1708, in London, the son of Robert Pitt, a member of Parliament from Cornwall. His mother was Lady Harriet Villiers, a daughter of Anglo-Irish nobility. His grandfather, Thomas "Diamond" Pitt, was a former governor of Madras who used his Indian fortune to purchase the borough of Old Sarum. Pitt pursued studies at the elite Eton School and Trinity College, Oxford.

In 1735, Pitt took the seat of Old Sarum in Parliament, succeeding his eldest brother Thomas. He developed an instant dislike to the platform of the Whig leader Sir Robert Walpole and adamantly opposed his policies. In 1739, Pitt's inflammatory rhetoric over the Spaniards' mistreatment of British sailors, including Captain Robert Jenkins, helped force Walpole to declare war on Spain. The result was the War of Jenkins' Ear (Anglo-Spanish War, 1739–1744).

During the 1740s, Pitt became a leading figure in British foreign policy, developing a vision of the grand strategy needed to extend

British statesman William Pitt the Elder, First Earl of Chatham, who achieved perhaps his greatest fame directing the British victory in America during the French and Indian War. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

Britain's empire. Pitt had already envisioned a massive Franco-British struggle in North America, the result of which had to be the defeat of New France. Despite angry opposition from King George II, he was admitted as a junior member into the Cabinet under Prime Minister Henry Pelham in 1746.

Pelham died in 1754. His brother, the Duke of Newcastle, succeeded him as prime minister. This was a severe blow to Pitt, who believed that he should have been the new prime minister. Newcastle dismissed as only minor the growing conflict between Britain and France in India, North America, and elsewhere. He even attempted to downplay the humiliating defeat in North America of Major General Edward Braddock's forces at Fort Duquesne on July 9, 1755. Pitt saw that the monumental struggle against the French in North America had commenced. He also believed that Britain had no choice but to prosecute the war vigorously as part of his grand vision to oust the French from America.

By 1756, the Seven Years' War (French and Indian War, 1754–1763) had begun in earnest. Unprepared, Britain initially suffered a series of military defeats. These debacles caused King George II to relent in his opposition to Pitt. Pitt became secretary of state, and in December 1756 he took total control of the war effort.

Pitt reorganized the British military and its logistical system. He increased the number of men under arms, dismissed incompetent officers, and promoted younger, talented officers. He also brought up a bill to raise a national militia and rid the army of Hessian

troops. Pursuing a global strategy, Pitt made destruction of France's colonial empire in North America and in India his primary goal. Using huge cash payments to Britain's Prussian ally, he was able to tie down the French Army in Europe, preventing it from coming to the assistance of France's American colonies.

Pitt strongly encouraged his military commanders—Major General Robert Clive in India and Major General Jeffery Amherst in North America—to defeat the French with all due speed. In 1758, British and colonial American forces were victorious over the French in a number of battles, capturing the French fortress at Louisbourg, as well as Fort Duquesne and Fort Oswego. In 1759, Major General James Wolfe took Quebec, and in 1760 Montreal fell to the English. Meanwhile, British victories in India assured their control there. By 1760 Britain was poised to become the preeminent European world power. Clearly, Pitt's vision and political and organizational work had a lasting impact on the French and Indian War.

In 1761, Pitt was forced to resign, even as he urged a continuation of the war. The king opposed Pitt's stance because of the enormous costs of the conflict. Pitt remained a member of Parliament.

After 1763, tensions increased between the American colonies and the British government over issues of taxation, representation, and troop quartering. Pitt was at first conciliatory toward the colonials and opposed the British government's attempts to impose taxes on the colonies. Yet he simultaneously claimed British sovereignty over the colonies. Pitt was on record as opposing the inflammatory Stamp Act (1765). In 1766, too ill to effectively engage in politics, he accepted the title Earl of Chatham.

In April 1778, in poor health, Pitt returned to Parliament to oppose the hard line being pursued by the government against the rebellious colonists. During a brief speech he collapsed and never recovered, dying in London on May 11, 1778.

Plymouth Colony

The second permanent settlement of English colonists in North America established by a congregation of radical religious dissenters called Pilgrims (or Separatists), who held irreconcilable differences with the Church of England. Plymouth was founded in 1620 on what is now referred to as Cape Cod, Massachusetts. First migrating in 1608 to a more tolerant environment in Holland, the Pilgrims opted to leave the Netherlands in 1620 and immigrate to the New World. Joined onboard the *Mayflower* by non-Separatist

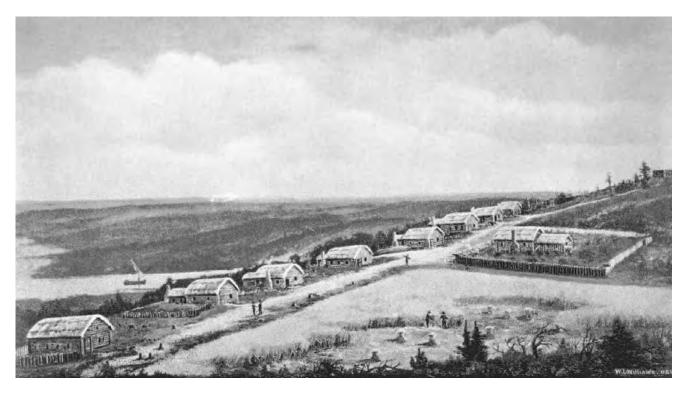

colonists recruited by the colony's merchant sponsors, the Pilgrims set sail for the northern regions of the London Company's Virginia settlements. This location was to be near enough to the established colony for security, but far enough away to avoid persecution.

On November 11, 1620, after 66 grueling days at sea and severe weather that blew the ship off course, the *Mayflower* anchored off the coast of present-day Provincetown, Massachusetts. Without a royal charter delineating a legal and administrative organization, 41 male passengers onboard the ship signed the Mayflower Compact, creating a civil government for the colony. Christopher Jones, the ship's captain, and Myles Standish, the military adviser for the colonists, immediately oversaw a reconnaissance of Cape Cod. By mid-December, they selected the former Native American village of Patuxet as a site for the settlement and named it New Plymouth (later Plymouth) after the port of origin of the *Mayflower*. Diseases first introduced by European traders had wiped out Patuxet's inhabitants years earlier.

During the first difficult winter, only 7 colonists remained untouched by ill health. Most of their ailments had originated on the voyage across the Atlantic. By March 1621, sickness and starvation had claimed 50 of the original 102 colonists. Anxiety grew over both the ever-diminishing number of settlers and the expectation of trouble with natives. Tensions subsided, however, when Ousa Mequin (Massasoit), the grand sachem of the nearby Wampanoag Confederacy, forged an alliance with John Carver, the first governor of New Plymouth. Beneficial to both parties, the treaty provided security for the colony and military aid for the Wampanoags in case of hostilities with their traditional adversaries, the Narragansetts. The alliance also brought Wampanoag goodwill to the starving colonists, who learned from their native neighbors how to grow corn and where to fish.

On November 9, 1621, the *Fortune* arrived at Plymouth Harbor with 35 additional colonists, most of them non-Pilgrims. The *Anne* and the *Little James* appeared two years later, also bringing supplies and more settlers. By 1627, the colony's population had swelled to 150. During the next three decades, the colony expanded beyond the town of Plymouth to include the villages of Duxbury, Scituate, Taunton, Sandwich, Yarmouth, Marshfield, Rehoboth, Eastham, and Bridgewater. The growth of the colony necessitated a change in the structure of government. These changes allowed individual villages to handle some of their own affairs. Overall governance, however, remained the purview of the colony's general court—a legislative body of "freemen" (citizens of the colony who could vote and hold office) presided over by the governor and his assistants.

Throughout the initial years of settlement, survival dictated the types of economic activity undertaken. Subsistence farming on individual parcels of land, however, soon replaced the original communal labor system. Fishing, lumber, and trade in cattle became the preliminary money-making enterprises. Searching for more productive means of liquidating their debts to their investors in England, the Pilgrims and their non-Separatist cohorts expanded the bounds of Plymouth. Tapping into the lucrative trade in beaver pelts, the colonists established trading posts on the Kennebec River

Thatch-roofed cabins line the single street of Plymouth Colony in 1622. Ill-prepared for fishing and not yet adept at cultivating corn, the Pilgrims struggled to survive for the first years of the colony. (Library of Congress)

and the Penobscot River in Maine. These northern trading posts were problematic, however, as they were frequently the targets of French raiding parties.

Wessagusset, a small, English fur-trading colony (in present-day Weymouth, Massachusetts) temporarily challenged Plymouth's regional monopoly in the fur trade. However, in 1623, the Wessagusset colony, fearing more hostilities with the Massachusetts tribe following a raid on the settlement, abandoned their trading post and sailed back to England. This left Plymouth, for the time being, with sole control of the area's fur trade.

In 1626, Plymouth colonists erected a southern trading post at Aptucxet on the western side of Cape Cod, at the tip of Buzzard's Bay. Aptucxet facilitated trade in fur and wampum southward to the Connecticut River where, in 1633, the colony established an outpost near the Dutch House of Good Hope (present-day Hartford). There, the English found themselves embroiled in economic rivalries with the Dutch, the Pequots, and the Mohegans based largely on the wampum trade. When the Pequot War (1636–1638) erupted in the Connecticut River Valley, the Plymouth colonists refused to participate, leaving the Connecticut Colony and the Massachusetts Bay Colony to bear much of the burden of the war.

Throughout the mid- to late-17th century, Plymouth saw its landholdings and economic security slowly eroded away by the region's swelling Massachusetts Bay Colony. The colony's relations with its native neighbors also worsened, culminating in King Philip's War (1675–1676), in which Plymouth suffered heavy dam-

age to several towns and the loss of many lives. Plymouth, however, continued to exist as a separate entity until it was absorbed along with the Massachusetts Bay Colony into the Province of Massachusetts Bay in October 1691.

Pocahontas

Born: 1595 or 1596 Died: March 20, 1617

Daughter of the powerful Chief Powhatan and influential intermediary in the first years of the Virginia settlement. Born in 1595 or 1596 in modern-day Virginia, Pocahontas has assumed many identities and controversies both in life and death. The name Pocahontas is a nickname meaning "mischievous/playful one," but her public name was Amonute, and her personal name was Matoaka.

Pocahontas, daughter of the powerful Powhatan, depicted here during her voyage to England, supposedly saved Captain John Smith from death by pleading with her father. (Library of Congress)

She was one of approximately 30 children of Powhatan, the paramount chief of the Algonquian-speaking peoples known as the Powhatans, who dominated the Tidewater region of Virginia.

In 1607, Pocahontas encountered Captain John Smith, the military head of the fledgling Jamestown settlement. Still only a girl, she allegedly saved Smith's life, which was about to be extinguished by Powhatan hunters. The exact details of the occurrence are subject to much debate and interpretation, but conventional wisdom claims that she threw herself on top of Smith to protect him from the blow of a war club. From then on, Pocahontas became well known to the English colonists.

Probably in 1610 or 1612, Pocahontas married a Powhatan named Kocoum. In 1613, Pocahontas was made a captive by Samuel Argall, who hoped to exchange her for English prisoners being held by the Powhatans. While in captivity, Pocahontas learned English and was exposed to Christianity, and before her ordeal was over the following year, she had converted and was baptized as "Rebecca." She also met John Rolfe while in captivity, and the two were married in 1614. The marriage temporarily suspended most of the hostilities between the natives and English.

In 1616, Pocahontas accompanied her husband on a journey to England. Pocahontas was something of a phenomenon in London, and as such she and her husband were lavished with attention and hospitality. It is believed, although it cannot be positively substantiated, that Pocahontas had an audience with King James I, whom she found so humble that she did not believe she had met the king until after the visit. In 1617, Rolfe, who was anxious to return to his

plantation along the James River, decided to set sail for Virginia. But before the ship cleared the River Thames, Pocahontas became desperately ill. She was taken ashore near Gravesend, where she died on March 20, 1617.

Records referring to Pocahontas are sparse and contradictory, which has led to many debates surrounding her life. The debates largely revolve around her rescue of Smith in 1607, as well as her role as European Americans' symbol of a "good Indian" because of her Christian conversion and subsequent marriage to Rolfe, as well as her previous compassionate rescue and alleged love affair with Smith. The rescue and the meaning behind it are controversial because Smith failed to mention it until after Pocahontas had become very popular in England. Finally, the alleged love interest between Pocahontas and Smith seems to have been entirely constructed from a reencounter in 1616, when both met again in England. During this meeting, Pocahontas reminded Smith of his obligations to her and the Powhatan people.

Point Pleasant, Battle of Event Date: October 10, 1774

The only major battle of Lord Dunmore's War of 1774. This war between the British colonists and Native Americans began in April 1774, when numbers of frontiersmen attacked native settlements in the Ohio River Valley. Subsequent retaliatory raids by the natives prompted Virginia governor John Murray, Fourth Earl of Dunmore, to send 2,000 men into the area. The desire of many in Virginia and in Pennsylvania to expand colonial settlement beyond the

Two major militia columns moved into Indian country: one headed by Dunmore and the other by Colonel Andrew Lewis. On July 12, 1774, Dunmore ordered Lewis to proceed from Camp Union (present-day Lewisburg, West Virginia) to the mouth of the Kanawha

Proclamation Line of 1763 has much to do with the war.

River, where Dunmore's army was to link up with him from Fort Pitt. Lewis arrived at the rendezvous point with 1,100 men on October 6, 1774, camping at Point Pleasant, a triangle of land at the confluence of the Kanawha River and the Ohio River and site of the modern-day city of Point Pleasant, West Virginia. Dunmore changed his plans, however, ordering Lewis to join him in attacks on the Shawnee settlements along the Scioto River. Before Lewis could depart Point Pleasant, however, he came under a fierce Native American attack.

Shawnee scouts had located Lewis's force on October 6, and the warriors sought an immediate attack. Chief Cornstalk, an advocate of peace negotiations, insisted on a council to discuss the issue. When it voted in favor of an attack, Cornstalk led a force variously estimated at 300–1,000 Shawnee, Mingo, Delaware, Wyandot, and Ottawa warriors against the unsuspecting militiamen at dawn on October 10.

The battle was hard fought and lasted all day. Lewis sent some of his men around to outflank the attackers, who were finally driven off at nightfall. In the Battle of Point Pleasant (also known as the Battle of Kanawha), the militiamen sustained some 75 killed and 150 wounded, while the Shawnees are reported to have lost only 33 dead. Nonetheless, it is counted as a militia victory because they held the field and because Cornstalk now entered into negotiations with Lord Dunmore, securing peace on October 19, 1774, with the Shawnees surrendering all claims to lands south and east of the Ohio River. Eventually the other tribes also agreed, bringing the war to an end.

Ponce de León, Juan

Born: 1460 Died: July 1521

Spanish soldier and explorer. Juan Ponce de León was born sometime in 1460 in San Sérvas de Campos, Spain, into a noble family of

Etching of Spanish explorer Juan Ponce de León (1460–1521). One of the better-known explorers because of his quest for the fabled Fountain of Youth, Ponce de León accompanied Christopher Columbus on his second expedition to the New World in 1493. (Library of Congress)

little means. As a young man, he became a soldier, and in the early 1490s he fought against the Muslims (Moors) in the southern part of Spain. In 1493, Ponce de León set sail for the New World on Christopher Columbus's second voyage to the Americas. He did not return to Spain with Columbus but stayed in the Caribbean and in 1502 settled on what is now Hispaniola. In 1504, he became the governor of Higuey Province on Hispaniola.

In 1508, Ponce de León, while purportedly searching for gold, began the conquest of the island now called Puerto Rico. He went on to serve as its governor beginning in 1509, in the process amassing a fortune via gold and land speculation. His brutal treatment of the natives in Puerto Rico resulted in his ouster in 1511. The Spanish Crown granted him the right to find, explore, and conquer the island of Bimini (in the Bahamas) in 1512.

On his voyage to locate Bimini, and perhaps the fabled Fountain of Youth, Ponce de León happened upon Florida. He first sighted the Florida Peninsula on March 27, 1513, naming it Pascua de Florida (Feast of Flowers) because of its discovery on Palm Sunday. By making several trips to Florida, Ponce de León eventually charted most of peninsular Florida by 1521. He also discovered the Gulf Stream, a warm current of water that passes through part of the Caribbean and parallels the southeastern coast of North America. Meanwhile, in 1514 he had returned to Spain for a brief visit during which the king appointed him a captain general.

Still believing Florida was an island, Ponce de León left for Florida from Puerto Rico on February 20, 1521, still determined ultimately to reach Bimini. His expedition of some 200 men instead

622 Pontiac (Obwandiyng)

landed on the western coast of Florida. Ponce de León hoped to establish a Spanish colony there, but the fledgling settlement soon fell under attack by hostile natives, and the Spaniards abandoned the site in short order. Wounded during one of the skirmishes, Ponce de León died soon after arriving in Havana, Cuba, in July 1521.

Pontiac (Obwandiyng)

Born: ca. 1720 Died: April 20, 1769

Ottawa native leader, who gave his name to Pontiac's Rebellion (also known as Pontiac's Conspiracy and Pontiac's War) in 1763. Little is known about the early life of Pontiac (also known as Obwandiyng). Most historians place his birth about 1720, although dates range widely, from 1703 to 1725. Many sources believe his father was an Ottawa and his mother an Ojibwa. His birth place also is unknown, but most likely was near present-day Detroit, Michigan, or Defiance, Ohio.

As a young man, Pontiac probably participated in the fighting between the French and the British. He fought for the French in King George's War (1744–1748) in 1745 and probably participated, as an Ottawa war chief, in the ambush of British forces under Major General Edward Braddock advancing against Fort Duquesne at the start of the French and Indian War (1754–1763) in 1755. Colonial ranger officer Robert Rogers claimed to have met with Pontiac in 1760, although most historians now believe this to be a bogus report. In any case, Rogers's subsequent publication *Pontieach*; or the Savages of America (1765) began the process of mythologizing the native leader.

Pontiac rose to prominence following the British defeat of the French in North America during the French and Indian War. Jeffery Amherst, British commander in chief in North America failed to understand the need to alleviate native fears and cultivate their friendship. Despite advice from British Indian agents George Croghan and Sir William Johnson, Amherst raised prices on Indian trade goods and curtailed the French practice of gift giving. Both actions angered the Native Americans.

At the same time, Delaware prophet Neolin influenced many of the Northwest natives, including Pontiac. Neolin's call for nativist religion required a return to the "old ways," including abandonment of many European conveniences and the ousting of Europeans from native territory.

Chief Pontiac (also known as Obwandiyng) of the Ottawas, shown here in council during Pontiac's Rebellion, 1763. (North Wind Picture Archives)

In April 1763, Pontiac convened a meeting of the tribes of the Northwest near Detroit on the Ecorse River. Pontiac passionately restated Neolin's message to the assembled natives, but insisted that the French were allies and should be left alone. Only the English were to be attacked.

The subsequent Pontiac's Rebellion was a series of coordinated attacks against English forts in the Great Lakes–Ohio Valley region. The centerpiece of native strategy was an attack in May 1763 led by Pontiac against Fort Detroit, which, however, miscarried. Pontiac then initiated a siege of that post, the longest such sustained military operation in North American native history, which eventually failed. Pontiac then withdrew to the Illinois Country. It is by no means clear how much he was able to influence native operations. Probably he was more an inspiration for the uprising than its actual field commander.

Although the native attacks overwhelmed a number of garrisons, the British rushed reinforcements to the region. One by one, the tribes reached accommodation with the British. Pontiac himself made peace in August 1763.

In July 1766, Pontiac and other chiefs met with Johnson, the British superintendent of Indian Affairs, at Fort Ontario to negotiate a formal peace treaty. The English called Pontiac a "chief," but probably the Ottawas did not have such a position at the time. Nonetheless, the British negotiated with him as if he held such authority as leader of a broad native coalition. Native American

protocol, however, called for war chiefs to step down in favor of civil chiefs when negotiations took place. Despite custom, Pontiac sought to speak for all the natives of the Northwest, both assembled and absent. This action alienated him from many natives, including a number of Ottawas.

Pontiac's arrogance in treating with the British may have led to his death. Forced to quit his Ottawa village on the Maumee River in 1768, he returned to the Illinois Country and on April 20, 1769, was murdered in the village of Cahokia, across the Mississippi River from present-day St. Louis, Missouri, stabbed in the back by a Peoria Native American. Pontiac was left to die in the street. The French supposedly buried his body, but the location is unknown.

Pontiac's Rebellion

Event Date: 1763

Conflict between Native Americans and English colonists that followed the French and Indian War (1754–1763). Pontiac's Rebellion, also known as Pontiac's War or Pontiac's Uprising, was named for the principal native leader, Chief Pontiac, an Ottawa.

The conflict sprang from the defeat of the French. Most Native Americans had allied themselves with the French against the English in the contest between the two great colonial powers. Indeed, the alliance between the French and most natives had been both longstanding and warm, as well as beneficial to both sides. Many Frenchmen lived among the natives and married native women. French policies toward the natives were also far more benign than were those of the English.

The reason for the benevolent attitude of the government of New France toward the natives is obvious. Vastly outnumbered by the English, the French desperately needed Native American support in times of war. That the arrangement worked may be seen in the fact that most Native Americans fought on the French side against the English. It was therefore most disquieting to Native Americans of the Great Lakes and Ohio Valley region to have their longstanding friends depart and be replaced by their enemies. As early as

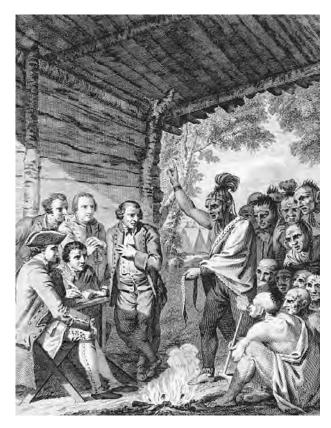

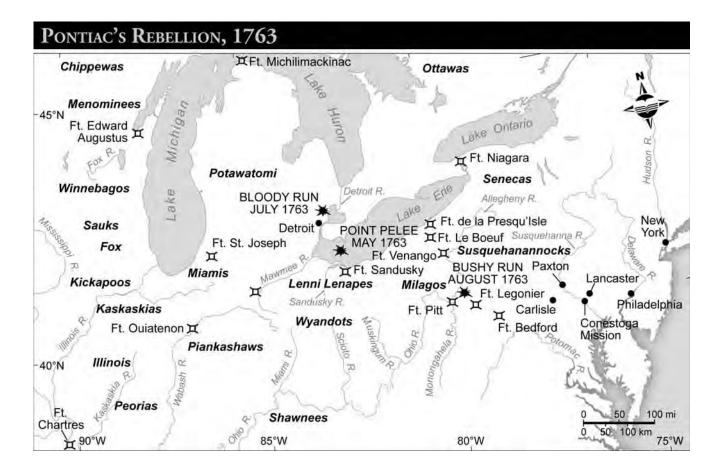

Illustration depicting Ottowa Native Americans negotiating with British colonel Henry Bouquet near the English camp on the Muskingum River during Pontiac's Rebellion. (Library of Congress)

1761, the Senecas of New York had circulated a wampum belt among the natives of the region calling for the formation of a confederation to continue the armed struggle against the British. Although this Seneca appeal elicited little response, it nonetheless was indicative of the widespread native discontent.

Native American policy fell to Major General Jeffery Amherst, the British commander in chief in North America. Amherst thought little of the natives and did not understand the need for policies that would allay their fears and win their friendship. Although George Croghan and Sir William Johnson, two men with wide knowledge of native affairs, sought to dissuade him, Amherst proceeded to raise the price of trade goods and end the longstanding French practice toward the natives of gift giving. These decisions outraged and deeply offended many native peoples and made war virtually inevitable. By the spring of 1763, natives from western New York to the Illinois River were prepared to go to war.

Two Native Americans had a decided influence on subsequent events. The first was the Delaware mystic Neolin, known as the Delaware Prophet. In part influenced by Christianity, Neolin preached a nativist religion that called on his people to reform their habits but also to break off relations with the Europeans and return to the ways of their forefathers. Neolin had an immense influence on the people of the Great Lakes.

The second individual was Chief Pontiac. He too was deeply upset over the British victory and now decided that the time had come to oust the British from the region. Pontiac issued a call for a meeting, and in April 1763, the Great Lakes nations sent representatives to a place near Detroit on the Ecorse River.

For about a month the natives discussed the course of action to be followed. Pontiac added his impassioned oratory to the Prophet's teachings and assured the representatives that the time for action was at hand. For practical reasons, Pontiac assured his listeners that the Delaware Prophet's teachings regarding Europeans did not include the French, who were to be left alone. It was the British and the few natives allied with them who were to be attacked and annihilated. After the native representatives had reached agreement to go to war, they returned to their villages to build support for the effort there. Each native group was assigned certain military objectives to fulfill.

The British military presence in the Great Lakes area was concentrated at Fort Detroit and at Fort Pitt in the Ohio Valley. Another dozen smaller British posts were scattered throughout the region. Pontiac himself took responsibility for the reduction of Detroit, while in semicoordinated attacks, warriors of various nations were to attack English-held forts all along the frontier.

On May 7, Pontiac and a large party of warriors entered Fort Detroit. He had arranged with the commander of the post, Major Henry Gladwin, to hold a ceremonial dance there with the plan that, once the dance was begun the natives, who would carry concealed weapons, would fall upon the unsuspecting English. Either because he had been forewarned or because he was of a naturally skeptical nature, Gladwin forestalled the plan. His men were fully armed and prepared, leading Pontiac to call off the attack.

After he and his men had departed the fort, Pontiac found himself the object of heavy criticism from a number of his warriors and therefore allowed his followers to open hostilities by mounting attacks on those settlers who had decided to remain outside the fort. On May 10, Pontiac called for a parley with Gladwin, who refused. Captain Donald Campbell then offered to meet with Pontiac. Gladwin sought to dissuade him but allowed Campbell to depart. When the British captain reached the designated meeting place outside the fort, the natives immediately took him hostage. Pontiac then demanded that Gladwin surrender the fort. Gladwin refused, whereupon Pontiac initiated what would become the longest North American native siege of a fortified position.

While the siege of Detroit went forward without result, the natives were enjoying great success in their operations elsewhere. On May 16, warriors secured entrance to Fort Sandusky by pretending to call a council. They then killed or captured all the men at the fort, both soldiers and traders, and secured the trade goods there. At Fort Miami (near present-day Fort Wayne, Indiana) on May 27, the native mistress of fort commander Robert Holmes asked his assistance in bleeding her sick sister. As Holmes exited the fort, he

was killed. A second soldier responded to the gunfire and was captured. The remaining nine men of the garrison then surrendered to an overwhelming number of warriors.

To the north, on June 2 at Fort Michilimackinac, the largest of the forts taken by the natives, Ojibwas and Sauks staged a game of *bag'gat'iway*, similar to lacrosse, outside the fort. native women and other spectators watched with guns and other weapons hidden under blankets. After several hours of play, the ball was launched into the fort. Securing weapons from the spectators, the players then entered the fort supposedly to retrieve the ball. Michilimackinac was the last of the surprise attacks on English garrisons.

In a two-week span, eight forts had fallen to the natives. The British forts lost also included St. Joseph (Niles, Michigan), Ouiatenon (Lafayette, Indiana), Venango (Franklin, Pennsylvania), Le Boeuf (Waterford, Pennsylvania), and Presque Isle (Erie, Pennsylvania), all of which had been held by fewer than 30 men each. The British abandoned Fort Burd and Fort Edward Augustus. Forts Pitt, Ligonier, and Bedford were all attacked but held out, as did Fort Detroit.

On May 28, a British force of 96 men in 10 bateaux under Lieutenant Abraham Cuyler put in to Point Pelee on the western end of Lake Erie on their way from Niagara to Detroit with supplies. Not long after making camp, they came under surprise native attack. Cuyler and only a handful of his men managed to escape in two bateaux.

Attacks after mid-June 1763 confronted a now-alert British military. Various Native Americans, including but not limited to the Senecas, the Mingos, the Shawnees, the Delawares, and the Wyandots, assaulted the string of forts leading to Detroit and the roads that supplied it.

The key was Detroit and victory there eluded the natives. At Detroit, Pontiac led a coalition of Ojibwas, Potawatomis, Wyandots and Ottawas in a loose siege. Although the natives could block access to the fort by land, they could not do so on the water. Two vessels, the schooner *Huron* and the sloop *Michigan*, were able to reach Detroit and resupply it. Pontiac ordered fire rafts floated down the Detroit River into the anchored ships, but the latter were moved in time to avoid destruction. A native attempt to board the ships and take them by storm was discovered and beaten back. In November, a frustrated Pontiac ended the siege and withdrew his forces to the Maumee River.

The British were not idle, and soon reinforcements were on their way to the Northwest. Able British colonel Henry Bouquet led 400 men from Fort Niagara to relieve Fort Pitt, which had been under considerable pressure since the beginning of the fighting. Its commander, Simeon Ecuyer, refused to yield to Delaware demands for surrender and reportedly sent smallpox infected clothing among the natives that led to an epidemic.

About 30 miles from Fort Pitt, Bouquet's relief column came under heavy attack by a large force of Delawares, Wyandots, Mingos, and Shawnees. In the Battle of Bushy Run on August 5–6, 1763, Bouquet's men drove off the attackers and marched on to Fort Pitt, relieving it.

The Battle of Bushy Run proved to be the turning in the struggle. Although sporadic warfare continued for another two years, isolated native groups began to conclude peace with the British. Pontiac himself eventually recognized the hopelessness of his position and made peace in August 1765. Pontiac's dream of a final victory over the English would not be realized.

Popé (El Popé)

Born: Unknown Died: 1688

Spiritual leader from San Juan Pueblo, near present-day Santa Fe, New Mexico, and leader of one of the most effective Native American revolts in North American history. There are no detailed written or oral accounts of Popé's birth or early life. He first appears in the historical record in the early 17th century, when Spanish colonists strove to gain control over the northern provinces of New Spain.

The repressive policies of the Spaniards toward the Pueblo peoples drove Popé (also known as El Popé) onto the path of rebellion. Worst of all for Popé was the effort by Franciscan friars to eradicate Pueblo religious icons and ceremonies. In reaction to these moves, Popé began preaching the maintenance of traditional religious practices and railed against all things Spanish and Christian.

As Popé's message spread throughout the Pueblo settlements, Gov. Juan Francisco Treviño in 1675 ordered the arrest of native spiritual leaders and medicine men in the province of New Mexico. Popé, along with 46 other medicine men, was taken by force to the capital in Santa Fe and charged with witchcraft. Four of the prisoners were condemned to death, although one committed suicide before the sentence could be carried out. The remainder were whipped and imprisoned.

Owing to the loss of their spiritual leaders, the Rio Grande Pueblos threatened to revolt against the Spanish. This prompted a worried Treviño to release his captives. Later in 1675, Popé returned first to San Juan Pueblo and then fled to Taos Pueblo after he had been implicated in the stoning death of his son-in-law and

the governor of the pueblo, whom Popé suspected was spying for the Spanish. At Taos, Popé devised plans for a widespread revolt.

Popé successfully overcame obstacles created by distance and language barriers to unify at least 24 pueblos in a coordinated revolt against the Spanish in early August 1680. Using cords of maguey fibers, Popé devised a method for synchronizing the attack with knots symbolizing the number of days remaining before the commencement of the uprising. Runners carried the cords to the leaders of each pueblo, who then untied one knot per day until there were none remaining, the sign to begin the strike.

The Pueblo Revolt began on August 10, 1680. Approximately 8,000 of Popé's followers killed nearly 400 Spanish colonists and 21 of the 33 Franciscan friars in the region. Those Spaniards who were not killed or wounded initially sought safety at the Governor's Palace in Santa Fe (and at the few pueblos that had not participated in the uprising) before fleeing southward toward El Paso del Norte and Mexico.

Following his successful revolt, Popé ordered the destruction of the remaining vestiges of Spanish culture, including objects associated with Christianity. He likewise banned the use of the Spanish language and surnames and annulled marriages consecrated by the Catholic Church. In their place, Popé insisted on a return to traditional cultural practices.

Exulting in his victory, Popé chose to remain in Santa Fe and reside in the former governor's palace. He soon became overbearing, demanding tribute payments from all the pueblos and punishing those that refused to comply. As Popé's authoritarianism increased, his support eroded and the alliance collapsed as villages returned to their familiar practice of autonomy. When Popé died sometime in 1688, probably in Santa Fe, the stage was set for the Spanish to reconquer New Mexico.

Portobello, Attack on

Start Date: November 21, 1739 End Date: November 22, 1739

Successful British naval operation against the Spanish colonial port of Portobello on November 21–22, 1739, during the Anglo-Spanish War of 1739–1744. Founded in 1597, Portobello was located on the Atlantic Coast of the Isthmus of Panama. Arguably the most important Spanish city in the New World during the 17th and 18th

centuries, Portobello was the transshipment point for precious metals to Spain. Spanish ships transported silver and gold from mines in Ecuador and Peru down the Pacific Coast to Panama City. The treasure was then transported overland across the isthmus on the Camino Real (Royal Road) to Portobello, where it would be shipped across the Atlantic to Spain.

The poorly manned Spanish fortifications of Portobello were an open invitation for determined attackers. Pirates and English privateers had repeatedly struck the city. Sir Francis Drake has captured it in 1596 and Sir Henry Morgan had repeated this in 1668. These attacks led the Spanish to construct a fortification known as the Iron Castle to guard the entrance to Portobello's harbor. Inside the harbor, two additional fortifications, San Jeronimo and Gloria Castles, defended the town itself. The Spanish had made improvements to these works as late as 1735. Portobello also served as a base for *guardacostas* (Spanish coast guard vessels) that routinely harassed British merchant shipping in the region.

In late July 1739, three months before Britain officially declared war on Spain, Vice Admiral of the Blue Edward Vernon set sail from England with orders to attack Spanish colonial holdings and shipping interests in the Caribbean. After stopping at Port Royal, Jamaica, to resupply, Vernon proceeded to Portobello with six ships of the line mounting a total of 470 guns and carrying 2,500 seamen and marines. Arriving off Portobello on the night of November 21, 1739, Vernon attacked the port the next morning. Despite unfavorable winds that hindered the ability of his ships to enter the harbor, the *Hampton Court* (70 guns) moved into position to exchange cannon fire with the Iron Castle until the *Norwich* (50 guns) and the *Worcester* (60 guns) could join the fray.

When the British bombardment had suppressed the Iron Castle's fire, sailors and marines stormed the fort and captured 40 Spanish defenders. Before Vernon could attack the forts in the harbor's interior the next day, the Spanish governor, Francisco Martines de Retes, requested terms of surrender. Unable to mount an effective defense with his small garrison, he agreed to turn over the town and remaining fortifications without further resistance.

Vernon seized three *guardacosta* vessels, as many as 72 bronze guns, and approximately 10,000 Spanish silver dollars. Iron guns were also captured, but these were disabled and not carried off. Over a three-week span, the British expended 122 barrels of captured Spanish cannon powder to demolish the Spanish fortifications. Vernon then withdrew.

While Britons celebrated Vernon as a hero for his exploits at Portobello, the victory had little long-term significance. Vernon's attempt to attack Cartagena in the spring of 1741 met with near disaster.

Port Royal (Nova Scotia)

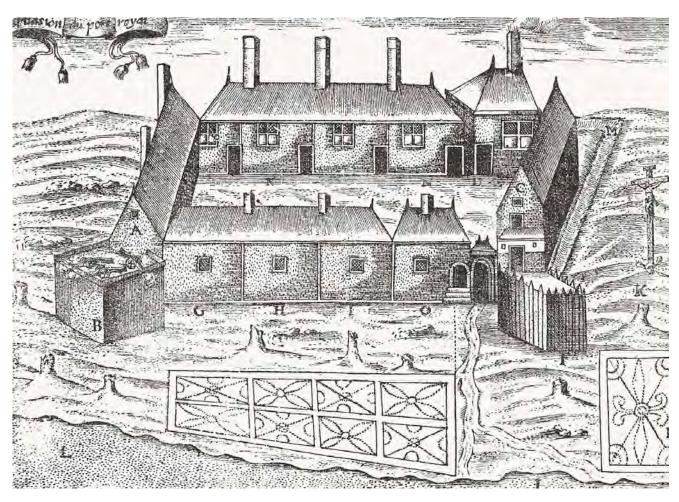

First French settlement in Acadia and the scene of repeated French-English conflict. In 1604, Frenchman Pierre du Gast, Sieur de Monts, explored the coast of Maine in search of an appropriate site for a Catholic mission to the Micmac. His expedition, which numbered about 120 people in all, included Jean Bencourt, Sieur de Poutrincourt, and Samuel de Champlain. Initially, the expedition camped at Dotchet Island on the Bay of Fundy, but the death of 36 men there during the first winter prompted the move to Port Royal in 1605.

Forty more men arrived at Port Royal in the summer of 1605, but 12 died of scurvy that winter. The next year Poutrincourt sent

for reinforcements. Only 7 men died during the winter of 1606–1607 because the settlers had grown sufficient crops to store some for the winter. Nonetheless, Monts and Poutrincourt soon abandoned the project, and for two years the fort lay empty.

When Poutrincourt returned around 1610, he brought with him Jesuit missionaries, alienating his Protestant backers. The Marquess de Guercheville purchased Acadia and gave her interest to the Jesuits, who brought additional food supplies to Acadia in mid-1611. But Guercheville withdrew her support because the Jesuits and Poutrincourt were continually at odds. In 1613, English colonists under the command of Captain Samuel Argall of Virginia attacked and burned Port Royal while the settlers were tending their fields. Many of the surviving settlers became *coureurs de bois*. Poutrincourt brought fresh provisions in 1614 and arranged for a new set of backers, namely La Rochelle's Huguenot merchants. He provided the merchants with a load of furs and never returned. By 1624, Poutrincourt's interest in Port Royal came to an end. Charles de Latour then became proprietor of the settlement.

Meanwhile, the English Crown awarded Sir William Alexander Acadia and Canada on September 10, 1621. A Scottish settlement at

Grandville in 1629 foundered, however, and the 1629 Treaty of St.-Germain-en-Laye returned Canada and Acadia to France. French chief minister Cardinal Richelieu made his cousin, Isaac de Razilly, the Acadian governor. But Latour believed that Acadia was his, and so he and Razilly clashed. When Razilly died in 1635, his heir, Charles d'Aulnay, came into conflict with Latour. D'Aulnay banished Latour from Port Royal in 1644. After d'Aulnay's death in 1647, his creditors tried unsuccessfully to take possession of the fort.

As governor, Latour granted Port Royal to d'Aulnay's widow and then married her. In 1654 a New England expedition took the French outposts at Penobscot and Port Royal, but the English nonetheless permitted self-government. The Treaty of Breda in 1667 returned Port Royal to France. French immigration resumed in 1671.

In 1667, Acadia's European population numbered some 400 people, more than three-quarters of them living in or around Port Royal. An unknown number married Native Americans and became *coureurs de bois*. By 1687 the population had doubled to 800 people, by 1714 it was 2,100, and by 1747 there were 12,500 French settlers in Acadia.

Between 1667 and 1710, the British besieged Port Royal five times, principally because it became a haven for French privateers attacking New England shipping. Its sacking by a New England expedition under Sir William Phips in 1690 was part of a plan to take Quebec. Life at Port Royal was difficult and oftentimes chaotic. Indeed, at times agricultural and other subsistence pursuits appeared all but impossible. In the span of just 20 years, the English sent four expeditions against Port Royal.

In October 1709, a meeting of English colonial governors laid plans for a joint expedition to seize Port Royal. Colonel Francis Nicholson commanded the expedition, which was supported by a British naval force of 36 vessels, including a bomb ketch, under Captain George Martin. Nicholson had a regiment of Royal Marines and 3,500 provincials. The English began the siege of Port Royal on September 24, 1710. Confronted by a force five times his own, the governor of Port Royal, Daniel d'Auger de Subercase, surrendered the citadel on October 16.

The English renamed the fortress Annapolis Royal in honor of Queen Anne. Acadia became British territory under the Treaty of Utrecht in 1713. The French inhabitants wanted to leave, but British governor Samuel Vetch refused to let them depart to Cape Breton or Prince Edward Island. The Acadians instead were asked to swear allegiance to the English Crown in return for exemption from fighting the French or their native allies. Later they were ordered to take the oath of allegiance without the exemption, and most responded by preparing to vacate the area. The British, however, refused to allow them to colonize anywhere other than on English territory. During the next 40 years of intermittent Anglo-French warfare, the residents of Port Royal remained as "French neutrals," under pressure to take the oath and accept English schools and French Protestant ministers.

Annapolis Royal came under attack, this time by a force of French and Micmac Native Americans, in September and October

1744. The local inhabitants failed to respond to the French call to arms and ultimately English reinforcements from New England raised the siege. Another combined attack by the French and the Micmacs occurred in the spring of 1745. Both sides left the Acadians alone to harvest their crops.

In 1750, a number of the French Acadians were again denied their request for permission to depart, and in 1755 during the French and Indian War (1754–1763), the Acadians were expelled and forcibly resettled in English colonies as well as in Louisiana and the West Indies, because British officials considered them a threat to the security of Nova Scotia.

Port Royal (Nova Scotia), English Attack on Event Date: 1613

English assault on French-held Port Royal, Acadia (Annapolis Royal, Nova Scotia). French king Henry IV, eager to plant a permanent French settlement in North America, named Pierre Du Gua, Sieur de Monts, as the viceroy for Acadia in 1603. French colonizers, including Samuel de Champlain, established Port Royal in 1605. The settlement, christened "the Habitation," was erected in the fertile Annapolis Valley. This followed the failure of the Saint Croix settlement in 1604. Although the Acadians enjoyed good relations with the neighboring Micmacs, the viceroy abandoned the Habitation in August 1607 after losing his fur-trade monopoly. Jean de Biencourt, Sieur de Poutrincourt, resettled Port Royal in 1610.

In early 1613, Sir Thomas Gates, Virginia's deputy governor, authorized an attack against Port Royal in an attempt to drive the French encroachers from territory claimed by Virginia as its northernmost domain. In June 1613, Captain Samuel Argall's ship, the *Treasurer*, reached Saint-Sauveur and Mount Desert Island, the two most isolated French settlements in the region. Although the English destroyed both outposts and took several French prisoners, Virginia's leaders then ordered Argall to return to Acadia and complete the job by expelling the French encroachers entrenched at Port Royal. In July 1613, Argall's force destroyed what remained of the Saint Croix settlement. Argall then set his sights on Port Royal,

located across the Bay of Fundy. Luckily for the English, the residents were nowhere to be found. Some of the French colonists were searching for food and supplies while others tended to the surrounding fields.

The abandoned settlement was no match for Argall's force, which, hoping to make Port Royal uninhabitable, butchered the community's cattle, sheep, pigs, and horses. Meanwhile, other attackers looted the dwellings before setting them on fire. After thoroughly destroying Port Royal, the English ambushed the residents working in the fields above the fort. Fleeing laborers watched in horror as Argall's men torched their precious harvest. Satisfied that he had fully carried out his orders, Argall set sail for Virginia on November 13, 1613.

Charles Biencourt de Saint-Just, Poutrincourt's son, proceeded to rebuild his father's ransacked settlement, and Port Royal's residents gradually resumed their lives of farming and fur trading. In time, Port Royal became the capital of French Acadia.

Port Royal would experience subsequent English attacks. In 1690, William Phips captured Port Royal during King William's War (1689–1697), although the Treaty of Ryswick (1697) returned the outpost to France. During Queen Anne's War (1702–1713), the fortress capitulated to Colonel Francis Nicholson on October 13, 1710. The subsequent Treaty of Utrecht (1713) ceded Acadia, excluding Cape Breton Island and Prince Edward Island, to England and Port Royal became Annapolis Royal.

Port Royal (South Carolina)

Name given to the area in far southeastern South Carolina, from Beaufort in the north to present-day Hilton Head Island in the south. Port Royal also refers to Port Royal Sound, named by the French in the mid-16th century. The area collectively named "Port Royal" lies just north of the Savannah River and was, until Georgia's founding in 1733, the southernmost point of English colonization in North America. Prior to that, the area had been Spanish territory, although the Spanish never colonized it beyond the placement of some defensive posts and tiny settlements.

Port Royal Sound is the southeastern coast's deepest natural harbor and offers easy access to the Sea Islands of southern South Carolina. The region, called the "low country" because of its low elevation, is bisected by dozens of rivers and creeks—both large and small. There are also dozens of islands, separated by tidal marshes, rivers, and Port Royal Sound.

Port Royal's climate is typical for the southern coast. Its subtropical climate offers a nearly frost-free growing season, which is perfect for the cultivation of southern staple crops such as sea island cotton (not widely cultivated there until the late 18th century), rice, and even sugar cane. Port Royal's long, torrid, and oppressively humid summers, however, are the perfect environment for diseases such as yellow fever.

The Spanish were the first to explore and exploit Port Royal's strategic location. Captain Pedro de Salazar is thought to have discovered Port Royal Sound, probably in 1515. In the mid-1520s, expeditions by captains Pedro de Quexos and Lucas de Ayllón cemented Spanish claims to the area, which they named Santa Elena (Saint Helen). In 1525, Ayllón built North America's first European fort in Port Royal. The Spanish would use Port Royal Sound as an anchorage for trade and exploration missions, especially those originating in the Caribbean.

In 1562, French Huguenot Jean Ribault took a band of would-be settlers to the New World to establish a French Huguenot settlement on what is now Parris Island, in Port Royal Sound. Ribault named his settlement Charlesfort and dubbed the area "Port Royal." The French settlement effort was doomed, however. In 1565 the Spanish Crown dispatched a naval squadron to destroy it. In 1566 the Spanish established their own settlement on Port Royal Sound (Ciudad de Santa Elena), which served as the capital of Spanish Florida until 1573. Troubles with Native Americans forced them to abandon it in the late 1580s.

Although the Spanish continued to claim the area as their own, English explorers such as Captain William Hilton and Colonel Robert Sandford began scouting the area in the 1660s. Both tried to stake British claims at Port Royal. In 1670, King Charles II established the lords proprietors, who began doling out land grants to Port Royal. In 1684, Scottish immigrants established Stuart Town. The Spanish razed the settlement in 1686.

Beginning in 1698, English settlers began arriving in Port Royal with steady frequency. Soon thereafter, forts and trading posts went up, signaling the beginning of a lively trade business with local Native Americans. On Port Royal Island, English settlers established a settlement now known as Beaufort in 1711. The early years of English colonization at Port Royal were anything but easy. Pirates, hurricanes, skirmishes with the Spanish and Native Americans, and disease all took their toll.

Port Royal was ground zero during the Yamasee War (1715–1717), which witnessed the near destruction of Beaufort and the killing of scores of settlers. The Yamasees, the Creeks, and the Choctaws had banded together in their anger over abuses committed by white traders. Though the Yamasees were finally defeated,

the war left long and deep scars on Port Royal. Between 1731 and 1734, area settlers constructed Fort Frederick along the Beaufort River in what is now Port Royal, South Carolina. By then, a plantation system based on rice had already been established.

During the Anglo-Spanish War of 1739–1744, most of the English population of the Port Royal islands fled in fear of a Spanish attack from St. Augustine. King George's War (1744–1748) saw Port Royal classified as a royal naval station, which augmented the area's economy. Between 1758 and 1763, the British constructed Fort Lyttelton at Spanish Point, just one and a half miles south of Beaufort. The post was designed to protect the city and surrounding Port Royal during the French and Indian War (1754–1763). Fort Lyttelton also played a key role during the American Revolutionary War, where colonists fended off an attack by the Royal Navy in 1779.

Portsmouth, Treaty of

Event Date: July 11, 1713

Peace treaty between the English in Massachusetts and New Hampshire and the Abenaki, Penobscot, Kennebec, and Maliseet natives, signed on July 11, 1713, formally ending Queen Anne's War (1702–1713). The Treaty of Portsmouth was signed subsequent to the Peace of Utrecht (April 1713), which ended the War of the Spanish Succession in Europe. The agreement attempted—unsuccessfully—to provide greater security for English settlers in New England, particularly in New Hampshire.

New Hampshire had experienced constant threats throughout King William's War (1689–1697) as combined French and native forces attacked English settlements at Dover, Oyster River, Salmon Falls, Exeter, Portsmouth, and Hampton. By the beginning of Queen Anne's War, New Hampshire was better prepared to defend itself. An organized system of permanently manned garrison houses in each town sought to discourage the French and their native allies from repeating their earlier assaults. New Hampshire settlers also became more aggressive in their efforts to rid the colony of Native Americans. They sought out native parties before they had a chance to attack, destroyed their crops and villages, and participated in expeditions against French strongholds at Port Royal and Quebec. But they could not protect the frontier completely.

During Queen Anne's War, the Abenakis and other local native groups—encouraged by the French—attacked British settlements along a 200-mile frontier stretching from Maine through New Hampshire and into western Massachusetts. The raids continued until the European combatants signed the Treaty of Utrecht in April 1713.

Three months later, delegates from the eastern tribes, led by the Abenakis, met with Massachusetts governor Joseph Dudley at Portsmouth to sign a separate peace treaty. They acknowledged the sovereignty of the British monarch, promised to respect the rights of British colonists to the territory they occupied, and pledged to end their violence along the New England frontier. In so doing, the natives agreed to vacate New Hampshire. The treaty, however, failed to keep the peace. In 1722, the eastern natives violently resisted further land encroachments by British settlers along the northern frontier, which touched off yet another round of regional Anglo-native wars.

Pouchot de Maupas, Pierre

Born: April 8, 1712 Died: May 8, 1769

Officer in the French Army and noted military engineer who distinguished himself as a captain during the French and Indian War (1754–1763). Pierre Pouchot de Maupas was born in Grenoble, France, on April 8, 1712. He joined the French Army at age 21 as an apprentice engineer. Soon he was recognized as an accomplished infantry officer who showed a knack for military engineering. Pouchot saw action during the War of the Polish Succession (1733–

1738) as well as the War of the Austrian Succession (1740–1748). Much of his duty involved building fortifications. Rising steadily through the ranks, he became a captain in 1745.

Pouchot went to New France during the French and Indian War (1754–1763), arriving there in June 1755 and continuing his engineering duties. His first challenge was to strengthen the post at Fort Frontenac. He then took charge of rebuilding the defenses of Fort Niagara during 1755–1756. In 1759, Captain Pouchot received command of Fort Niagara. During his tenure, he showed considerable skill in negotiating with the area's Native Americans.

As part of their campaign in 1759, the British determined that they had to capture Fort Niagara and deny the French that strategic stronghold. In early July a British force of several thousand troops under Brigadier General John Prideaux arrived at the fort. Pouchot had sent most of his garrison to Fort Machault to join in the French expedition to retake Fort Duquesne. Pouchot was able, however, to hold off the British long enough to allow reinforcements from Fort Machault to come to his aid, only to see them defeated at the Battle of La Belle Famille on July 24. With the defeat of this French relief force, Pouchot surrendered Fort Niagara to the British on July 25, 1759. Held with his men as a prisoner of war, Pouchot was released in December 1759.

Pouchot returned to duty in time to take part in the campaign of 1760 as commander of Fort Lévis on the St. Lawrence River. In August 1760, a British contingent led by Major General Jeffery Amherst advanced on the fort. Pouchot had 400 men and two gunboats with which to defend the island post. Almost immediately, one gunboat was lost to an accident, and the other soon surrendered to the British, enabling the attackers to cut off the fort from reinforcement.

The siege of the fort began on August 23 and lasted for two days. The British bombarded the fort from shore until the redoubt had become useless, whereupon Pouchot surrendered. In 1761, Pouchot returned to France. With his military career in limbo, Pouchot devoted himself to penning his memoirs about his service in the French and Indian War. Not published until after his death, these remain an important primary source on the French role in that conflict. Pouchot died on May 8, 1769, in Corsica, after participating in the French conquest of the island.

Powhatan (Wahunsonacock)

Born: ca. 1547 Died: 1618

Paramount chief over a loose confederacy of Algonquian-speaking nations on the coastal plain of Virginia when the English established Jamestown in 1607. Powhatan (his "throne" name) inherited leadership of at least 5 native nations, whose territory adjoined the fall lines of three rivers: the James, the Pamunkey, and the Mattaponi. The rest he brought under his control through a combination of force, persuasion, and intimidation in the decades preceding English settlement. By 1618, it is estimated that Powhatan presided over roughly 30 Native American groups.

Powhatan's powers as paramount chief were limited. He usually ruled by prestige rather than force, with his ceremonial powers outweighing his real political or legal authority. He did not control much of the day-to-day life of his people. Ordinary natives had considerable personal freedom. Powhatan and his family probably spent some of their time living and working, as did all Powhatans.

Powhatan's success in building his paramount chiefdom was based in part on his personal qualities. The English described the chief as tall, kingly, and charismatic. But these qualities do not explain why he created the Powhatan Confederacy. He might have wanted to rebuild a population ravaged by disease or monopolize the European seaborne trade for copper, firearms, and other high-status goods. He may also have been reacting to other unknown internal native issues.

Powhatan initially welcomed the English outpost at Jamestown. A permanent English presence meant easy access to trade goods. The English might also have become useful allies in his wars with the Siouan-speaking Monacans to the west. His goal was to maintain an English presence, while not allowing them to become too powerful, or to make contact with his enemies.

Powhatan's relations with the English quickly soured. The newcomers' insistence on exploring beyond Powhatan's territory—and expanding onto Powhatan lands—greatly agitated the Powhatans. The situation was made worse when English colonists stole supplies of corn from the Powhatan settlements near Jamestown.

These tensions ultimately resulted in the First Anglo-Powhatan War (1610–1614), which ended when the English captured Powhatan's favorite daughter, Pocahontas. Following this event, Powhatan's power waned. The conflict seemed to have had a profound effect on Powhatan. He lost any will to fight white encroachments and instead chose to live a life of quiet solitude. Although he remained paramount chief until his death sometime in 1618, his younger brother and successor Opechancanough and others with great antipathy toward the English dominated Powhatan foreign policy in the 1610s.

Powhatan Confederacy

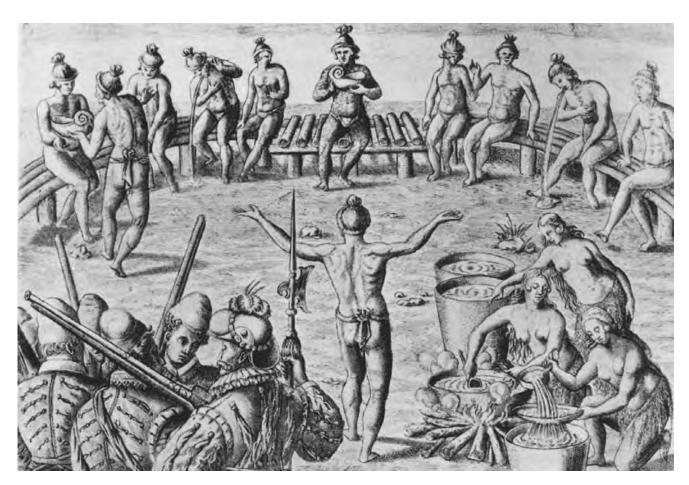

Confederation of Native American nations in eastern Virginia. Powhatan, a powerful chief, created the Powhatan Confederacy in the late 16th century as a loose collection of approximately 30 Algonquian-speaking tribes along the Virginia coastal plain. Tsenacomoco, as the Powhatans referred to this area, contained about 13,000 native inhabitants when the English arrived in 1607. Powhatan inherited control over several nations, including the Powhatans, Arrohatecks, the Appamattucks, the Pamunkeys, the Youghtanunds, and the Mattaponis. He may also have inherited the Werowocomo-

cos, the Chiskiacks, and the Orapaks, according to contemporary English sources. Powhatan brought the other neighboring tribes into his chiefdom through a combination of warfare, intimidation, and personal persuasion.

Sometimes referred to as a "mini-empire," the Powhatan Confederacy might best be viewed as a paramount chiefdom, in which Powhatan received tribute and homage from local chieftains of individual tribes. Powhatan usually ruled through prestige rather than by overwhelming force. His ceremonial powers outweighed his real legal and political authority. He in fact had little control over the day-to-day life of his people.

Following Powhatan's death in 1618, the paramount chieftaincy fell to his younger brothers, Opitchapam (Otiotan) and Opechancanough. It was Opechancanough who held the real power in the Powhatan Confederacy from the last years of Powhatan's reign until his own death in 1646. Opechancanough organized two massive assaults against the English, in 1622 and 1644. Opechancanough's capture by the English in 1646 ended Powhatan resistance. After 1646, the Powhatans were subject people of the English. In 1649, the paramount chiefdom was dismantled, and after that time local chiefs negotiated with the English independently.

Powhatans

The Powhatans (formally known as the Wahunsonacocks) were a loose confederacy of about 30 Algonquian-speaking Native American groups living on the Virginia coastal plain at the time of the English settlement at Jamestown in 1607. Powhatan territory extended from the southern bank of the James River to the fall line in the west (at present-day Richmond, Virginia), and north as far as the southern bank of the Potomac River. Their lands also included the lower half of the Eastern Shore. In 1607, on first contact with the English, their population numbered at least 13,000 people.

The Powhatans had been organized into a confederacy, often called a paramount chiefdom, by a leader named Powhatan. In the decades preceding English settlement, Powhatan inherited a handful of these native groups from his father. He brought the rest under his control through warfare, intimidation, and persuasion.

The Powhatans were a mostly sedentary people, living in towns surrounded by fields in which women grew corn, beans, and squash. They considered land to be owned communally by the tribe, except when a family was actively farming a portion of it. Most of the land was open to all for hunting and foraging. During parts of the spring and fall, Powhatans left their towns to take advantage of the seasonal bounty in the common woods. The men focused on fishing and hunting while the women gathered edible wild plants and nuts. Both men and women contributed considerably to the family's food supply and to survival in general. As a result, gender relations were fairly equitable, with neither partner holding great authority over the other in the family. Divorce was permitted.

Powhatans were also a very religious people. A class of priests performed rituals individually and on an as-needed basis for the members of their tribe. They did not enforce religious orthodoxy, however. The polytheistic Powhatans could believe in various deities and peacefully disagree with one another about the existence and relative power of different deities.

The Powhatans probably knew of Europeans a century before the English established Jamestown. Europeans of various nationalities had explored the eastern coast of North America in the 16th century, meeting and trading with the native inhabitants as they went. The Powhatans already knew of metal tools, glass, and woven

Contemporary illustration showing Powhatan, principal chief of the socalled Powhatan Confederacy in Virginia during the late 16th and early 17th centuries. (Library of Congress)

cloth, among other items, when the English arrived, because they had sporadically traded with other Europeans for these things for decades. The Powhatans were also already familiar with European diseases, such as smallpox, influenza, and measles before 1607. Finally, the Powhatans knew of two previous attempts at European settlement in their region—the Spanish effort to build a Jesuit mission on the York River in the early 1570s, and the English "lost colony" on Roanoke Island in the 1580s.

The Powhatans initially welcomed the English outpost at Jamestown. A permanent English presence meant easy access to desirable trade goods. The Powhatans also believed the English might be useful allies in their wars against the Siouan-speaking Monacans west of their territory. But relations with the English soon grew tense. The English insisted on exploring up the rivers into the territories of Powhatan enemies, and demanded or stole supplies of corn from native towns. The English also offended Powhatan sensibilities when they arrogantly pushed their own religion and culture on them. These tensions resulted in the first Anglo-Powhatan War (1610–1614), which ended when the English captured Powhatan's favorite daughter, Pocahontas. Following this embarrassment, Powhatan's power waned, and although he remained paramount

chief until his death in 1618, his younger brother Opechancanough and others hostile to the English began to dominate Powhatan foreign policy thereafter.

During the next three decades, relations between the Powhatans and the English vacillated between war and uneasy peace. The Second Anglo-Powhatan War (1622–1632) and the Third Anglo-Powhatan War (1644–1646) decimated the Powhatans. After 1646, the Powhatans were a conquered people. Some were enslaved; others were confined to well-delineated areas and compelled to pay the English an annual tribute. For the remainder of the 17th century, the Powhatans suffered declines in both population and cultural cohesion, as the land and rights granted to them in the Virginia-Indian Treaty of 1646 were gradually eroded away by the English. By the end of the 18th century, their few remaining descendants retained little of their language and traditions.

Praying Towns and Praying Indians

Algonquins who lived in New England and converted to Protestant Christianity became known as "praying Indians," and many of them lived in segregated communities known as "praying towns." Unlike the French or the Spanish, for whom Christianization of the natives was conceived of as a sacred duty, English Christianization efforts had as much to do with strategic and economic concerns as religious imperatives.

Systematic efforts to Christianize the natives did not take place until after 1644 in New England. In other areas of English North America it did not occur until the end of the 17th century. But all English missionaries shared the desire to "reduce" the Native Americans to civilization—meaning the destruction of their native identities and reconstruction along English lines. Simultaneously, English missionaries attempted to teach European political philosophy as a means to impose order in an uncertain colonial environment. That served the dual purpose of rendering the natives as harmless dependants and preventing English settlers from adopting native "lawlessness."

To accomplish this, the English adopted the French practice of segregating native converts in the praying towns. There they were immersed in the English manner of living as they were instructed

John Eliot, a Puritan missionary in Massachusetts Bay Colony and leader in the establishment of Praying Towns. (Chaiba Media)

in Christianity. Devised by the Puritan missionaries John Eliot (1604–1690) and Daniel Gookin (ca. 1612–1687), the praying towns were never very successful, however. Natick, Massachusetts, established in 1650, had a population of only 145 at its height in 1674. Unlike neighboring white towns and villages, the praying towns were governed according to far stricter legal and social codes. This rendered them essentially theocracies.

Sachems (chiefs) were the preferred leaders for the praying towns because natives were accustomed to paying tribute to them. The loss of tribute from those who refused to convert was most prohibitive, and praying Indians were barred from paying tribute to "pagan" sachems. The English offered bribes to sachems, which in native eyes were simply the requisite gifts exchanged before and after all negotiations. This critical misunderstanding constituted yet another disincentive for natives to convert and sachems to live in the praying towns. The settlements also served as staging areas for the application of pressure on nearby Native American villages to conform to English standards of diplomacy at the very least. In the ideal, it was hoped that they would convert to English civilization by means of emulation. Often times, lands successfully cleared and cultivated by praying Indians were appropriated by neighboring whites, using both legal and illegal means. Such scheming added to the natives' frustration and reinforced the unattractiveness of conversion.

Gookin complained on the eve of King Philip's War (1675–1676) that "many" of the praying Indians had "not yet come so far

as to be able or willing to profess their faith in Christ and yield obedience and subjection to him in his church." Indeed, he estimated that only 1,100 praying Indians inhabited Massachusetts' 14 praying towns. And only 45 of them had been baptized and fewer than 74 were in communion. It had been hoped that praying towns would act as buffers between Puritan towns and hostile natives. The English hoped, too, that praying Indians would inform them of impending native attacks. More often than not, however, they served neither mission particularly well. The outbreak of King Philip's War in 1675 dealt a virtual death blow to the praying towns and their residents, who were widely distrusted.

Presidio

Spanish fort erected in the borderlands in the Americas. The presidio was the basis of Spanish defensive strategy in the New World. Presidios were most prevalent in Mexico, what is now the southwestern United States (Texas, California, Arizona), and Florida. The concept of the presidio came from Spain's struggle with the Muslim Moors, who occupied Spain from 711 to 1492. In the New World, presidios were meant to serve as a bulwark primarily against Native Americans, but they also were intended to defend against the incursions of European foes.

The first presidios were simple, four-walled adobe structures. As time wore on, presidios grew in size and complexity. They were built along trade routes, near settlements, mines, and other strategic locations. The first presidios went up in the mid-16th century in response to the Chichimeca Revolt in the silver-rich Mexican province of Nueva Vizcaya. Discovery of silver in the province led to the opening of a large number of mines and towns outside the protection of Mexico proper. As was often the case, contact between natives and Spaniards led to conflict. The Spanish built a string of presidios in the region and along the roads to protect travelers and silver caravans.

Plan for the frontier presidio constructed on the orders of Captain Antonio, Marqués de San Miguel de Aguayo, at San Antonio de Abejar in Texas, 1722. (Archivo General de la Nación, Mexico)

Garrison troops at the presidios were not part of the regular Spanish Army. For most of their existence, they were a separate branch of the Spanish armed forces. The troops often came from the surrounding region and were responsible for buying and maintaining their own horses and equipment. Such troops were equipped with swords, long lances, a heavy armored coat of layered buckskin, a shield of bull hide, and, in the case of infantrymen, a musket. Pay was poor and for many years it was paid out in goods, not in currency. Troops suffered from a deluge of deductions in their wages to pay for the aforementioned equipment as well as for food and other expenses.

Presidios served a multitude of purposes, some by design and others by accident. In many cases, the erection of a presidio led to the founding of a nearby small town or settlement. If a presidio were built in an existing town, that settlement's population and economy tended to grow. The founding of a presidio gave merchants a stable market, as the garrison had to purchase provisions. Settlers often moved to an area near a presidio because it promised protection from native raiders and desperadoes. Presidios also served as Indian agencies as natives came to trade at the presidios and parley with authorities. Missions also sprang up near presidios for protection and the opportunity to reach out to native trading and diplomatic parties.

The major weakness of the presidio system was the isolation of each structure from the other and the lack of a unified command. Presidios were separated by many miles. For that reason, they were unable to support each other in times of attack, a problem that was never appropriately addressed. Spain attempted to remedy the weaknesses of the presidio system with three major reforms: the Reglamentos (Regulations) of 1729 and 1772, and the Instrucción (Instruction) of 1786. These various reforms tried to set uniform regulations for presidios and attempted to create uniform policies in regard to command, armaments, provisions, soldiers' pay, and defensive strategies. The Spanish government also responded to changing strategic situations by closing or moving presidios as threats and population concentrations shifted.

Presidio Nuestra Señora de Loreto (Texas)

See Fort La Bahía (Texas)

Presidio Nuestra Señora de los Dolores de los Tejas (Texas)

First Spanish presidio in Texas, built in 1716 and situated on the east bank of the Niches River, 15 miles west of Nacogdoches, Texas. Presidio Nuestra Señora de los Dolores de los Tejas, also known as Presidio de los Dolores and Presidio de los Tejas, sat opposite to Mission San Francisco de los Tejas.

In 1716, Captain Diego Ramon and Louis Juchereau de St. Denis led an expedition from Mobile Bay to establish way stations between the missions in eastern Texas and the Rio Grande. During their expedition, the two men determined that the missions in eastern Texas were too distant from military establishments and were thus practically defenseless. Ramon believed that if the Native Americans revolted, the missionaries would have no protection and would not survive even a small attack. In response, Ramon established Presidio Nuestra Señora de los Dolores de los Tejas in 1716.

In 1718, the Spanish found it necessary to abandon the fort and surrounding missions because the French had invaded eastern Texas. By 1721, however, the Spanish forced the French out of their territory. That same year, Marqués de San Miguel de Aguayo reestablished the presidio and moved it to the banks of the Angelina River, near Mission Nuestra Señora de la Purísima Concepción de los Hainai (modern-day Nacogdoches County). Here the presidio functioned until March 1728, when Brigadier General Pedro de Rivera y Villalon inspected the Texas presidios for the Spanish government. Villalon determined that the Native Americans in eastern Texas were peaceful and recommended that Presidio de los Tejas be abandoned. Once the Spanish left the fort in 1728, the government relocated the surrounding missions, San Francisco de los Niches, Nuestra Señora de la Purísima Concepción de los Hainai, and San José de los Nazonis, to the Colorado River. After France ceded Louisiana in 1763, the Spanish moved them to San Antonio.

Presidio Nuestra Señora del Pilar de los Adaes (Louisiana)

Spanish fort established in 1721 by the Marqués de San Miguel de Aguayo near present-day Robeline, Louisiana. The garrison was established to protect Spanish missions in the area from French attack. A similar outpost, Presidio Nuestra Señora de los Dolores de los Tejas, guarded the western portion of the Spanish mission field in East Texas. In 1717, a Spanish Franciscan mission, San Miguel de los Adaes, was founded in the same area as the presidio, some 21 miles from a French fort at Natchitoches. San Miguel was the easternmost of the Spanish missions in Texas.

In 1719, having learned of the French declaration of war against Spain during the War of the Quadruple Alliance (1718–1720), Philippe Blondel, a French lieutenant with approximately a dozen soldiers, captured the mission and took two prisoners—a soldier and a lay brother. The brother escaped, supposedly because the French were more interested in securing chickens from the mission than their prisoners, and made his way back to Spanish territory. Consequently, in Spanish Texas the conflict became known as the "Chicken War."

Given the French capture of Pensacola, the few soldiers available, and poor relations with local American Indians, the Spanish chose to retreat. In doing so, they abandoned six missions and a presidio in East Texas and western Louisiana.

The governor of Coahuila and Texas, Marqués de San Miguel de Aguayo, led an expedition to take back the Spanish territory in East Texas. He left in 1720 with 500 men, but by the time he arrived in East Texas, his nation was no longer at war with France. Thus, in 1721 Aguayo simply refounded the six missions and built Presidio Nuestra Señora del Pilar de los Adaes near the San Miguel de los Adaes mission, in order that it would not be taken so easily again. He garrisoned the new presidio with 100 men. In the coming years, Los Adaes would serve as the capital of Texas.

In 1727, General Pedro de Rivera ordered that the garrison at Los Adaes be reduced from 100 men to 60. This was part of a generalized reexamination of colonial outposts along New Spain's northern frontier. Given improving relations between Spain and France, the lack of success of the missions in east Texas, and the need to economize, maintaining a strong Spanish presence there did not make sense. A similar inspection in the late 1760s found the presidio's garrison in poor condition, and it was recommended that the presidio be abandoned. The transfer of Louisiana to Spain after the French and Indian War in 1763 had removed the primary need for the presidio. Thus, in 1772 the presidio was abandoned, and the capital of Texas was relocated to San Antonio.

Presidio San Antonio de Béxar (Texas)

Spanish presidio founded on May 5, 1718, by Martin de Alarcon and located on the west bank of the San Antonio River near the San Antonio de Valero Mission (present-day Alamo). Of the early presidios built in western Texas during Spanish rule, Presidio San Antonio de Béxar was one of the most important.

In 1722, Marqués de San Miguel de Aguayo decided that the presidio was too far from the Valero Mission and had it relocated on the other side of the San Antonio River. When moved, the presidio consisted of one adobe house as the main building, with huts made of brush to house the garrison's soldiers. Throughout its history, the Spanish built no permanent fortifications at the site. Instead, they relied on its well-disciplined soldiers for protection.

From this location, the presidio was able to serve many purposes. Some of them included protection, escort duties, communications, and logistics. The main function of the presidio, however, was to protect the five surrounding missions: San José y San Miguel de Aguayo, Nuestra Señora de la Purisima Concepción de los Hainai, San Juan Capistrano, San Francisco de la Espada, and San Antonio de Valero. In addition to protecting the missions, the presidio also sheltered the civilian settlements in the surrounding San Antonio area during attacks. The presidio created a barrier between the Lipan Apaches and the Spanish settlements on the Texas coast and discouraged trade between the French and natives. Besides protecting the surrounding area, the presidio had the responsibility of providing escorts for officials and missionaries arriving at and departing from San Antonio. Because of its central location, Presidio San Antonio de Béxar helped relay communications from mission to mission and to the colonial government in Mexico. Since travel on the surrounding roads was dangerous, the presidio was also a major stop for convoy trains heading to settlements in the east.

The duties of the presidio changed significantly after 1772. In that year, Marqués de Rubi recommended that San Antonio become the new capital of Texas. He then reinforced the presidio with soldiers from other forts north and east of the area. With the designation as capital of Texas and a stronger force in Presidio San Antonio de Béxar, the captain of the presidio also became governor of Texas. The responsibilities of the presidio's soldiers increased with the greater need for communications and protection for the increasing number of civilians that moved there from the north and east. Although this increased the importance of the presidio, the local government never built walls or stockades to fortify the structure. Captains at different times planned to fortify the site but decided in 1806 to move the garrison across the river to the newly named Alamo. The Alamo ceased to be a mission, and its walls looked more formidable than the unimproved adobe house of Presidio San Antonio de Béxar.

Presidio San Augustín de Ahumada (Texas)

Spanish presidio erected in 1756, near present-day Wallisville, Texas (outside present-day Houston). Presidio San Augustín de Ahumada was situated on the site of an old French trading post to protect the nearby mission Nuestra Señora de la Luz. The Spanish government named the presidio in honor of Spanish viceroy Augustín Ahumada y Villalon, Marqués de las Amarillas.

Commonly called El Orcoquisac, the presidio created more problems for the missionaries than it solved. Conflicts between the soldiers and Native Americans began in 1759. The Orcoquizas rebelled that year when a Spanish soldier killed a member of the tribe. The only means the garrison had to quell the uprising was the execution of the guilty Spanish soldier.

Besides existing as a military fortification to protect missionaries from hostile Native Americans, the presidio created a barrier between Spanish Texas and French Louisiana. The Spanish government hoped to prevent trade between French traders and Texas natives and any French incursions into Texas. El Orcoquisac indeed proved effective in keeping French encroachers from settling in Texas. With the French defeat in the French and Indian War in 1763, France ceded Louisiana to the Spanish. This eliminated the main purpose of San Augustín de Ahumada. Although obsolete, destroyed by a hurricane, and rebuilt farther east, the fort continued to function. In 1767, Marques de Rubi made his inspection of the northern provinces of Spanish Mexico and officially reported that the presidio was no longer needed. With no major menace in eastern Texas, the garrison received orders to participate in the fight against the Apache uprisings. By 1771, the last soldier had left the presidio and the Spanish had abandoned the military fortification, never to return.

Presidio San Francisco de Xavier (Texas)

Spanish post built in 1751 along the banks of the San Xavier River (known today as the San Gabriel River) in present-day Rockdale, Texas. Presidio San Francisco de Xavier de Gigedo operated from 1751 to 1758.

Planning for the presidio began in early 1750. That year, Captain José Joaquin de Ecay Muzquiz began laying plans to protect the nearby San Xavier missions. Sponsored by the College of Santa Cruz de Queretaro, the Spanish viceroy established the three San Xavier missions—San Francisco Xavier de Horcasitas, San Ildefonso, and Nuestra Señora de la Candelaria. The purpose of the missions was to create a barrier between the Lipan Apaches and the Spanish settlements on the Texas coast. The Spanish also hoped that they would discourage trade between the French and area natives.

In December 1751, Captain Felipe de Rabago y Teran finished building the presidio. Rabago, however, disliked the location of the presidio and the missionaries. His lewd behavior and the violation of the sanctuary at Nuestra Señora de la Candelaria created tension among the missions. Worse yet, Rabago's actions led to serious tensions between the missionaries and the soldiers garrisoned at the presidio. Eventually, this led to the excommunication of all the soldiers at San Francisco de Xavier. In addition to the tension between the Spaniards, the soldiers did not always treat the missions' natives well. This in turn led to a significant drop in the number of natives living and learning at the missions.

In 1753, the presidio received a new commander, Miguel de la Garza Falcon. Because of the dwindling number of natives living in the missions and a mysterious attack on Nuestra Señora de la Candelaria, which took the lives of a priest and a soldier, Falcon recommended relocating the missions and presidio. He recommended either San Antonio or San Saba, where the climate was better and where there was a larger native population. While waiting for royal approval of the transfer, Falcon moved the missions and presidio to the San Marcos River in 1755. Within a short time, the Apaches signed a peace treaty with the missionaries. This all but ended the need of a military garrison around the missions at San Marcos.

With no potential converts for the missionaries and nothing for the garrison to protect, the San Francisco de Xavier missions and presidio were transferred to the mission built along the San Saba River. The transfer ended the service of Presidio San Francisco de Xavier de Gigedo in 1758. The only remnants of the missions and presidio were the San Francisco Xavier Mission on the Guadalupe River. That site consisted of a small group of Mayeyes natives who did not want to move to the missions at San Antonio.

Printz, Johan Björnsson

Born: July 20, 1592 Died: May 3, 1663

Swedish military officer and governor of New Sweden (1643–1653). Born the son of a Lutheran minister in Bottnyard, Sweden, on July 20, 1592, Johan Björnsson Printz was educated for the ministry in Sweden and in Germany. While he was pursuing his studies in Germany, a troop of mercenaries forced him into service. Unexpectedly, he proved to be well suited to military life, and subsequently served with Austrian, French, and Danish forces, among others. Printz voluntarily joined the Swedish Army in 1625 and rose to the rank of lieutenant colonel. About 1640, Printz underwent a courtmartial in connection with his surrender of a Saxon city. Although cleared of wrongdoing, Printz had been removed from command and was without a post when he was offered the governorship of New Sweden in 1642.

Woodcut of Johan Printz, governor of New Sweden during 1643–1653. Printz did his best to expand the colony but could never overcome the lack of Swedish settlers. (North Wind Picture Archives)

640 Privateering

Accompanied by his wife and five of his six children, Printz was 50 years old when he arrived in the New World as governor of New Sweden in February 1643. Contemporary accounts describe Printz as weighing over 400 pounds. The Native Americans called him a name that translated to "Big Tub."

Printz's orders gave him absolute power over the colony's government and business interests, and he exercised that power quite liberally. Printz imposed strict rule on the colony. He purchased additional land, promoted tobacco farming, and improved crop and livestock production. He also undertook the construction of a number of forts and settlements.

Printz also presided over the criminal justice system and ordered the execution of a man who led a protest against his rule. Printz wrote home pleading for more settlers, but to no avail. The population of New Sweden fell to fewer than 200 people, in no small part due to settlers deserting to neighboring Dutch and English colonies.

New Sweden under Printz endured numerous setbacks, including poor harvests, encroaching neighbors, and lack of support from Sweden. Queen Christina lost interest in the colony and stopped sending supplies. No ships or communication from Sweden arrived between 1647 and 1653. The fur trade collapsed from lack of trade goods. New Sweden no doubt survived as long as it did thanks to Printz's diplomatic skills. He maintained peace with the native peoples and with New Netherland and the English. Nevertheless, the Dutch established Fort Casimer on New Swedish territory in 1651.

Finally, in 1653 Printz sent his son to Sweden to plead for help. Although the younger Printz soon secured a promise of relief, news of it did not arrive in New Sweden until after Printz himself had departed for Sweden. Embarking on a Dutch ship, he left behind a struggling colony supervised by his son-in-law. After Printz returned to Sweden, he undertook other official assignments, and eventually became governor of his home district. Printz died on May 3, 1663, in Gunillaberg Manor, Sweden.

Privateering

Privateers were privately owned ships licensed by their governments to seize on the high seas the ships, cargoes, and crews belong-

ing to nations with which their own state was at war. Privateersmen were free to dispose of the prizes and their cargoes for their own financial benefit. The motive for privateering was pursuit of wealth.

Privateering was widely practiced between the 16th and 19th centuries. In the Mediterranean, both the Muslim privateers of North Africa and the European Christians, were known as corsairs. The English who pursued the Spanish treasure ships were called buccaneers, the Dutch were known as sea rovers, and the French were called filibusterers.

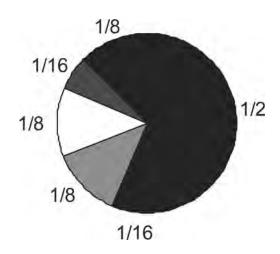

The difference between piracy and privateering is tenuous but boils down to the fact that privateers plied their trade in the name of a nation while pirates were out purely for their own interest. In practice, the privateer and pirate were not much different and were often the same individuals. Privateers were common in times of war, as these ships acted as an important supplement to a nation's navy, or even as a substitute for one. Nations with small navies relied heavily on privateers to fight a guerrilla-style war on the high seas at minimal cost.

Privateers sailed alone or in packs to capture ships and raid or temporarily capture and loot isolated settlements. Captured settlements might be ransomed by their inhabitants to save their communities from destruction. Privateersmen outfitted their own ships and crews, and the crewmen were paid from the booty secured in their raids. In many cases, privateersmen secured financial backing from private investors who shared in the wealth derived from captured ships and towns. Many of these backers were prominent traders, merchants, politicians, and in some cases, kings and queens. Many privateersmen were themselves prominent seamen looking for profit during times of war. The risks were great but the rewards could be substantial. Because of this, during war it was often difficult for regular navies to recruit seamen, many of whom were drawn to the more lucrative privateering.

Privateers possessed important documents that set them apart from common pirates. These were known as letters of marque and reprisal and were issued by the national governments to privateersmen who made application for them. The letters authorized privateersmen to capture vessels, and search and, if necessary, destroy them.

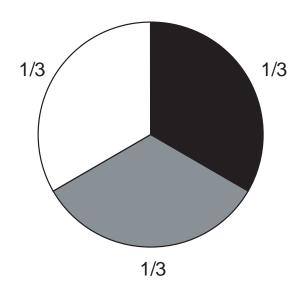

Throughout much of the colonial period, English and French privateers sought out and attempted to capture Spanish treasure ships traveling from the New World to Spain. The most successful privateers were the English privateers of the Elizabethan era. These men, encouraged and backed financially by the English government and royals, preyed on Spanish shipping and colonial outposts during the 16th and 17th centuries. The Elizabethan privateers prowled the shipping lanes of the Caribbean and struck at Spanish shipping off the Pacific Coast of Central and South America. They hit trade convoys between Mexico's Pacific ports and Spain's Philippine colony as well. This raiding was part of the grand conflict between England and Spain that ended in the ascendancy of the British Empire. The most successful English privateers were Sir Francis Drake, Henry Morgan, and John Hawkins. These men led large-scale privateering operations that included fleets of ships and the capture and ransacking of colonial Spanish cities.

Drake, operating in the 1570s, led forays into the Pacific and attacked Spanish shipping there. In 1585 he roamed the Caribbean, capturing Spanish ports and shipping almost at will. Morgan achieved the most spectacular success, however. He captured and sacked the rich city of Portobello and other Panamanian cities in 1688. In 1689, he terrorized towns in Spanish Venezuela.

Many of the early privateers were Frenchmen. Complicating matters was the fact that many of them were Huguenots (French Protestants), which added a religious tone to their predations. Ultimately, the French corsairs and their successors were so successful that they enabled the French government to wrest away part of the island of Hispaniola from the Spanish. The small island of Tortuga, off the northern coast of Hispaniola, became a de facto French colony even though it was officially part of the Spanish empire. From this base, the French raided Spanish fleets and encroached on western Hispaniola (Haiti). The French even named a governor general of Tortuga who actively recruited colonists and settled them on Tortuga and the western reaches of Hispaniola. Belatedly, the Spanish attempted to expel the French but failed. The Treaty of Ryswick of 1697 that concluded King William's War (1689–1697) ceded the western third of Hispaniola to France. In this instance, French privateers made a critical difference in the French land grab.

In later years, the Dutch employed privateers in the Caribbean. American privateersmen carried the brunt of the Patriot effort at sea in the American Revolutionary War and the War of 1812. The Declaration of Paris of 1856 in effect ended privateering. All the maritime nations signed the declaration, save for Mexico, Spain, and the United States. This decision came back to haunt the U.S. government during the American Civil War, for the Confederacy sent privateers to sea that captured a number of Union ships at the beginning of the war.

Prize Doctrine

The rules of practice under which licensed warships seized enemy vessels, crews, and cargoes in wartime for the financial benefit of

their sovereign and themselves. These rules were established under the law of nations, as international law was formerly called, and were followed from the 15th through the 19th centuries.

Licensed predators might be either naval vessels or privately owned fighting ships. If a naval vessel, its commission as a vessel of the national navy authorized its crew to seize enemy ships as prizes. If privately owned, it required a document from the sovereign called a "letter of marque and reprisal," which constituted it a privateer.

Licensed predators enjoyed substantial financial benefits. The officers and crew of a ship victorious at sea could expect to share the proceeds of a prize at least equally with their sovereign. Privateers, who were motivated solely by financial expectations, were not expected to share the proceeds of their prizes with the nation. The sovereign's share was waived from the outset in order to induce private parties to make the investments and take the risks necessary to aid the national war effort against a maritime enemy.

In the beginning, prize-taking resembled a modern act of mugging, but by the 18th century a body of more civilized regulations, the maritime law of nations, had evolved and achieved international acceptance. The law of nations sprang from two main sources. On the theoretical side there were the theologians and philosophers of natural law, men who argued that even kings ruling by divine right were subject to the limitations imposed by nature's God, especially in their warlike acts. They derived the theoretical basis of an international system to regulate warfare at sea from Greek philosophy, the Roman legal code of the Emperor Justinian, and the theology of the Roman Catholic Church. They supplied their ideas to a post-Renaissance community of European and Mediterranean powers eager for certainty and reciprocity in maritime affairs.

The other sources of the law of nations were neither scholarly nor philosophical. They were the local officials and judges who administered the maritime codes and customs of medieval seaports such as Barcelona, Visby, and Oleron. These givers of law dealt with the practical, everyday problems of thriving commercial ports: the rights of seamen and of shippers, prizes, salvage, wrecks, lost or damaged goods, and the like. But they did their jobs with such consistency, fairness, and devotion to the fostering of international trade that the laws they gave earned respect among mariners, shippers, and shipowners everywhere. The civil laws of these port cities blended with the philosophical foundation of the natural law scholars to produce a body of international law of surprising clarity and consistency and of widespread international acceptance.

As with any body of law, the doctrine of maritime prize evolved continually over the years of its principal vitality. It is best understood as it was generally accepted among maritime nations during the last great century of prize practice, from the mid-18th to the mid-19th centuries.

The proceeds from prizes captured by naval vessels were distributed in rigidly calculated proportions among the squadron commander, the captain, his lieutenants, and the lower ranks, all in accordance with naval statutes adopted by the sovereign. The divi-

sion of prize proceeds among privateering crews was controlled by contracts drawn up and signed before the voyage. In the absence of such a contract, half the proceeds went to the vessel's owners, and the other half was divided among the officers and crew in accordance with the statutory naval formula. In many maritime nations of Europe, the king or his admiral claimed a 10 percent share in the proceeds of prizes he had otherwise waived.

The Norman conquerors of England did not maintain a substantial fleet of public vessels of war. Instead, they relied for defense against invasion from the Continent primarily on private vessels commissioned in the English Channel ports. Initially the warden of the Cinque Ports and later officials called "admiral" had responsibility for marshaling and controlling these vessels as needed. In the 14th century other responsibilities were added, including the hearing and adjudication of maritime claims. By the 17th century, courts of admiralty had attained exclusive jurisdiction in England over all prize cases. The reasons for this development were twofold. There was the sovereign's desire to protect the royal share of the proceeds for the king or the admiral. In addition, the prize court sought to prevent the monarch's being embarrassed by the complaints of neutral nations that their shipping was despoiled.

On sighting a strange sail, the predator vessel approached warily in an effort to ascertain whether the stranger was of superior force or was flying false flags—normal practice to confuse an enemy. Once identified as a possible prize, the vessel, from then on referred to as the "chase," was rapidly pursued and forced to halt, a process called "bringing the chase to." The predator either signaled by flag, used a speaking trumpet, or fired a warning shot—this last requiring the predator to raise its national flag and reveal its true colors, as the rules of the prize court dictated. Should the chase come to voluntarily, the captor was required to remain beyond cannon range while inspection of the vessel took place.

All maritime nations supported the right of belligerents to halt and inspect neutral merchant vessels. But whether dealing with a neutral or enemy vessel, the law of nations clearly defined rules to be followed during the process. The inspecting officer was empowered to do the following:

- 1. Receive and review all documents of every nature found onboard the chase.
- 2. Inspect all areas of the ship other than those closed, battened, or locked. If a request to open such areas was refused the use of force was forbidden.
- 3. Speak to the captain and crew, and any passengers to verify their nationality and decide whether their accounts agreed with the ship's papers.
- 4. Require that every man on the muster roll be accounted for.
- 5. Transport the master of the chase and all the ship's papers to the captor vessel for examination by its captain.

The master of the predator, having considered the evidence, then decided whether the chase was a vessel of his own nation, an ally or a neutral engaged in inoffensive commerce, or an enemy vessel under license to the captor's nation for the duration of the present voyage. Such vessels were allowed to continue on their voyages.

Should it be discovered that the chase was a neutral vessel engaged in blockade running, or carrying enemy troops or contraband, or should the ship's papers appear fraudulent, then the captor could assume he had a valid prize. In that case, he had the right to transfer all or some of the crew of the chase to his own vessel and to replace them with a prize crew of his own men who would then sail the chase to the most convenient port of his own nation for adjudication in a prize court. The law of nations stipulated that the captain or mate of the chase plus one or two crew members were to appear at the prize court where the judge took their testimony independently.

If the chase proved to be an actual enemy vessel, the captor also was legally allowed to do the following:

- 1. Take from the chase water, provisions, ships' tackle, weapons, and ammunition if his vessel had need of them.
- 2. Transfer all the crew with their dunnage, imprison them on his vessel, and sink or burn the chase.
- 3. Create a "sea cartel" by not interfering in any way with the chase except for unloading onto its prisoners from earlier captures, all of whom would be required to sign a paper promising not to participate in the present war until formally exchanged for prisoners of the captor's nation. (In this way, the captain relieved himself of the necessity to feed and guard extra numbers of men.)
- 4. Ransom the chase. The two captains could agree on a sum of money promised to be paid as ransom whereupon the chase was released and sent on its way. It was usual to keep the captain or other valuable crew member aboard the captor as a "ransomer," for example, a hostage for payment of the sum promised.
- 5. Break off and abandon the prize. This usually only happened in face of a growing storm or if superior enemy vessels appeared on the scene.

The question of which prize court would adjudicate the case was under control of the captor's master, since he would choose a port to which the prize would be ordered. In making this decision, the captor enjoyed considerable discretion to consider the condition of the chase, the weather, and the danger of enemy interference. In addition, he was required by the law of nations to take into consideration the convenience of other parties having an interest in the captured vessel, such as owners or cargo shippers who might wish to appear in court as claimants against the condemnation of their ship or cargo. A flagrant disregard for the convenience of claimants could result in a loss of the prize in court and in extreme cases an actual finding of damages against the captor.

A great many of the prizes that were taken and sent off to port under the control of prize crews never reached their destination because they were recaptured en route by an enemy vessel, either naval or privateer. This was particularly true of British merchant ships during the 19th century, when that nation's control of the seas had become pervasive.

Thus many British ships reverted to their original owners when recaptured, and the recaptors could not make prize of them. But the owners did not recover their property free. The maritime law of nations, ever mindful that money motivates men, and wishing to encourage all sailors to help their countrymen recover their property from the enemy, decreed that recaptors should receive a financial reward from the owners. The law employed the analogy of a ship, at peril of the sea, saved from destruction by volunteers, called salvors. Immemorially, maritime courts imposed on the owner the obligation to pay to the salvors a share of the value of the ship and cargo saved, judicially determined to be proportionate to the labor performed and risks taken. So in the case of recapture, prize courts or legislatures imposed a similar charge on the owner, called "military" salvage.

Military salvage could also be earned by a process called "rescue." In this situation, prisoners of war aboard a prize and under the guard and control of a prize crew staged an uprising, overthrew their captors, and brought the vessel to a home port.

Recaptures, rescues, and military salvage could occur only with respect to a vessel that had not yet been condemned by a prize court and sold to a new owner. A judicially sanctioned sale of a vessel cut off all rights of prior owners and any vessel capturing it had a whole new prize of its own with no strings attached.

Since their origins in the medieval ports of Europe, maritime courts have dispensed justice with extraordinary dispatch, conscious that their witnesses and litigants were often eager to settle matters and sail on the next tide. Prize courts were held close to the wharves for the convenience of mariners. The English High Court of Admiralty sat at Doctors' Commons, in the shadow of St. Paul's Cathedral, or in an abandoned church at Southwark, across London Bridge. Both locations were close to the banks of the Thames River. Prize judges, concerned for the innocent neutral forcibly diverted from his voyage and for the deterioration of cargo, expected captors to prosecute their claims with diligence. Woe unto the captor who, having reached the convenient port of his choice, failed to promptly prosecute his libel against the prize.

Prize court procedure under the law of nations was carefully designed to permit mariners to play their role and leave early in the proceeding. The first and foremost question was prize or no prize. The law intended, whenever possible, for this key question to be decided promptly and exclusively on the basis of the ships' documents and on the rapid testimony of members of both crews. In the interests of expedition, crew members were not interrogated orally before the prize judge. Instead, their testimony was procured in the form of standing interrogatories, approved forms of judicial questionnaires, which were read aloud to the mariners and their answers recorded. Witnesses were required to sign each page, and a refusal to testify could result in confinement for contempt.

The interrogatories and ships' papers were then gathered up and delivered to the prize judge, who sought to decide the question of prize or no prize on the sole basis of the documents before him. If, from the evidence, the judge found that the chase was not a good prize, but that the captor had probable cause for suspicion, the captive was immediately released, and the parties went their separate ways. If the judge found that the captor's suspicions were unwarranted, the captive was entitled to immediate release, and to a judgment for damages against the captor. If, from the documents submitted, the judge found the chase to be a good prize, she and its cargo were sold, and the proceeds held by the court, first, for the satisfaction of valid claims by neutral claimants, especially cargo shippers, and thereafter, for distribution among the captor's sovereign and crew in accordance with the national statutes then in force. On the order of sale, neutral officers and crew members were free to depart, but the proceeds were held in the registry of the court for a year and a day to allow claimants time to appear.

Only when the documents submitted to the court raised serious questions which could not be answered to the judge's satisfaction was further evidence admitted in the case, and then it generally took the form of sworn affidavits rather than oral testimony.

Cargoes, as well as the vessels that carried them, were subject to condemnation as prize under the law of nations. The question became more complicated, however, when neutral goods were found on board an enemy ship, or enemy goods on a neutral ship. During the last great century of prize taking no problem was more vexatious to the uniform administration of the maritime law of nations.

It was always a major policy of the maritime law of nations to preserve the rights of neutrals to continue their accustomed trade, while other nations were at war, subject to belligerents' three superior rights: the right to halt and inspect, the right to confiscate military supplies (contraband) intended for the enemy, and the right to blockade. The interpretation and application of these principles was the major concern of prize courts during the last great century of prize taking. Of major interest was the issue of nationality. What was a neutral? The law of nations did not equate nationality with citizenship in the modern sense of the word. Rather, it concerned the nation within whose borders one resided, and to whose economy one contributed. A merchant or shipowner who remained in a nation at war, accepted its protection, and contributed to its economy was, for purposes of prize law, no longer a neutral but a national of that country.

Proclamation of 1763

Event Date: October 7, 1763

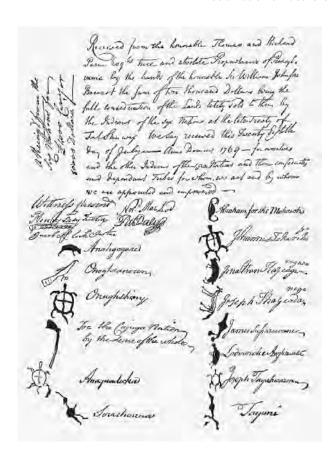

A direct consequence of the English victory in the French and Indian War (1754–1763), the Proclamation of 1763 closed western lands to colonial expansion. The population of British North America had been ecstatic with the outcome of the war, which removed the French threat and, they believed, would open the western lands to settlement. They were thus profoundly disappointed with the royal proclamation. King George III and his council, however, saw the proclamation as a means to calm Native American anxieties and to secure the frontier and protect the colonists from Native American attack. The English settlers perceived it as a direct infringement of their land rights.

The Treaty of Paris, signed by Britain, France, and Spain in February 1763, recognized New France (Canada) and all North American lands east of the Mississippi River as British territory. Colonial administrators, assured of England's dominant position in North America, responded by implementing postwar policies designed to reduce the expense of imperial administration.

Native American uprisings attributed to Neolin, a Delaware prophet, and Pontiac, an Ottawa war chief, necessitated immediate action on the part of London. The king's ministers responded quickly to the reports of frontier hostilities. Their plan provided for the orderly settlement of all lands recently acquired from France and Spain. The Royal Proclamation, issued in the name of King George III on October 7, 1763, defined the boundaries and intentions for civil government in four new colonies: Quebec, East Florida, West Florida, and Grenada. In addition, the measure prohibited English governors and military commanders from issuing warrants for survey or patents for lands beyond the crest of the Appalachians, beyond which settlement was now forbidden. English colonists living in the so-called Indian Country were ordered to leave at once.

The Proclamation of 1763 reflected the Crown's awareness that frontier hostilities between Native Americans and colonists would continue indefinitely unless the colonists were confined to the Atlantic seaboard. The pacification program, however, was offset by throngs of colonists who defied the demarcation line. To complicate matters, royal officials in the colonies often connived with land speculators in schemes involving tribal lands. Illegal land grants, surveys, and private purchases of lands from the Creeks and Cherokees, tribes that did not recognize the right of the English government to demarcate boundaries, also occurred.

British agents, particularly Sir William Johnson of the Northern Department, sought to ease tensions through diplomacy. Johnson and the Iroquois fixed the northern boundary line by the Treaty of Fort Stanwix in 1768. Additional treaties and land purchases occurred. In particular, the Treaty of Hard Labor negotiated by John Stuart with the Cherokees in October 1768, extended the reach of the king's boundary line farther north, south, and west.

The 1768 Treaty of Fort Stanwix. Negotiated by Sir William Johnson, in it the chiefs of the Six Nations ceded Native American lands south and east of the Ohio River to Great Britain. (North Wind Picture Archives)

The Proclamation of 1763 promised Native Americans a barrier to English expansion that was never fulfilled. Not surprisingly, the intrusion of westward-moving settlers beyond the Appalachians and Alleghenies sparked frequent retaliatory raids. By 1768, frontier hostilities became commonplace. Angry Shawnees, Wyandots, Delawares, and Mingos fought to retain their ancestral lands, particularly after the settlement of eastern Kentucky. Those tensions later culminated in Lord Dunmore's War of 1774. The repeated violations of the proclamation's prohibition against western settlement also persuaded several western tribes to cast their lot with the British during the American Revolutionary War.

Province Fort (Maine)

Fort built in 1743 by Massachusetts to protect frontier settlements in and around New Marblehead (present-day South Windham, Maine, then part of Massachusetts). Massachusetts officials ordered Province Fort's construction in reaction to Native American (mainly Abenaki) raids on settlements in Maine and as a general strengthening of the frontier. During the first half of the 18th century, English settlements in Maine often came under attack by native raiding parties. They were sometimes accompanied or inspired by French soldiers. Queen Anne's War (1702–1713) and Dummer's War (1722–1727) had resulted in heavy losses among both settlers and Native Americans.

As tensions between France and England increased in the 1740s, the Massachusetts General Court considered the question of building fortifications in areas of threatened attack. In the summer of 1743, the assembly voted £100 to pay for a fort at Salmon Falls, to protect the settlement of New Marblehead (now the modern town of South Windham, Maine). Construction began soon afterward, and the fort was completed in the summer of 1744. The timing was right, because King George's War (1744–1748) had erupted that spring. Province Fort was also known as Salmon Falls Fort.

The fortification had palisaded walls forming a square 50 feet on each side. The hemlock logs that made up the walls were one foot thick and were pierced with loopholes for the garrison to fire on attacking Native Americans. Two watchtowers at opposite corners allowed soldiers to fire along the walls to prevent attackers from setting fire to or scaling the walls. A number of buildings within the fort served as barracks and storehouses.

Raiding parties attacked Province Fort five times between 1744 and 1756, but they never captured it. The fort provided a key refuge for the local settlers. One popular story described how these fortifications could deter attack. At one point, most of the garrison and local male settlers were away trying to apprehend a Native American raiding party. Their families were gathered in Province Fort for protection when a messenger brought word that natives were near the fort. Ruth Elden, wife of the fort's commander, Captain John Elden, donned her husband's uniform and took charge of the situation. She had the other women dress like men and watch the walls with muskets ready. The natives were thus dissuaded from mounting an attack until the men had returned.

After King George's War ended in 1748, the settlers continued to prepare for conflict. Province Fort was maintained in good condition. Indeed, settlers built five additional palisaded blockhouses

after the war. Raids during the French and Indian War (1754–1763) failed to capture any of the fortifications. By 1759, however, the threat from Native Americans had been reduced, and the fort eventually became unnecessary.

Provincial Troops

Troops raised in Britain's North American colonies for service alongside British regulars and separate from colonial militiamen. The British adopted the designation "provincial" to differentiate these troops legally from the British regulars. The system of raising provincial troops evolved over a long period out of the various colonial militia systems. Infantry composed the bulk of provincial troops, and they were armed and equipped accordingly.

Often, colonial governments raised provincial troops to perform missions that were longer in duration than the militia could legally be called on to undertake. As time went on, provincial troops were recruited specifically for more distant enterprises. These were generally on the frontiers of their home colony, extracolonial expeditions, or even part of joint intercolonial enterprises.

Organizationally, provincial units for the most part resembled those of regulars. Thus, the regiment was the main unit, composed of a varying number of companies. The social composition differed markedly from British regular units, however. Officers were not of noble birth, and were often drawn from local elites, whose wealth and/or political connections as well as previous martial experience served as a means of recruiting men to follow them. The men who served in provincial units often came from the younger and less affluent parts of the community.

When a prospective commander recruited a provincial unit, he did so under the authorization of the colonial government. This support often came in the form of a bounty, which was used to induce enlistments in the ranks. The bounty, along with the better pay and less severe discipline that exemplified these units, made them more popular among the colonists than service in the British Army.

By the same token, British officers in the regular establishment often commented that the provincial troops were of inferior quality. Among their grievances were that provincial officers would not respect the authority of British regular officers. The British expected senior provincial officers to follow orders issued by their juniors in the regular service. While this practice was modified slightly by the Rule of 1755, which made generals and field officers

of provincial units equal in rank to senior captains in British regular units, it nonetheless remained a point of contention.

Provincials were also quick to point out that often orders given by regular officers contradicted the terms under which they had been recruited. British officers maintained, for the most part correctly, that provincials were poorly trained and of low quality, and that the men were likely to break and run under fire.

Colonial governments were determined to maintain control over their home military units. At the same time, men serving in provincial units were equally zealous of not exceeding the terms of the contracts. This exacerbated tensions with British officers, who had to plan and conduct operations accordingly. If a campaign did not conclude on time, the British commander might loose substantial numbers of men, for the provincials would simply leave the field when their contracts expired.

Provincial troops saw service in a number of colonial conflicts between 1690 and 1763. They served prominently in campaigns against Port Royal, Louisbourg, Quebec, and Montreal. British prime minister William Pitt's policy of using subsidies to attract colonial recruits led to the employment of provincial troops on an unprecedented scale during the French and Indian War (1754–1763).

Such service revealed the many practical problems regarding such troops. Units from one colony often refused to cooperate with those from another, while officers often squabbled over seniority in rank and chain of command. Nonetheless, provincial service helped serve as a training ground for many who later fought in the American Revolutionary War.

Pueblo Revolt

Start Date: August 10, 1680 End Date: August 21, 1680

Revolt of the Pueblo Native Americans against the Spaniards in New Mexico. The Spanish conquest of New Mexico began with Francisco Vásquez de Coronado's 1540–1542 quest for the mythical Seven Golden Cities of Cíbola. Intermittent Spanish forays into New Mex-

ico occurred thereafter, although permanent European settlements were not begun until Don Juan de Oñate y Salazar formally established New Mexico in 1598. Franciscan missionaries, eager to convert the sedentary horticulturalists they called *Indios de los pueblos* (village Indians), soon took up residence in the scattered pueblos.

Relations between the Spanish and the Pueblos took a turn for the worse in 1675, when Gov. Juan Francisco Treviño imprisoned 47 Native Americans he termed "sorcerers." These men were shamans who were perpetuating their sacred ceremonies. Three of the detainees were executed. Another committed suicide before angry Pueblo warriors forced the zealous governor to release those remaining.

Nearly a century of colonial encroachments, smallpox outbreaks, prolonged drought, forced conversions, demands for tribute, and the suppression of traditional practices led most Pueblos to long for an end to the Spanish oppression. Popé, a Tewa shaman from San Juan, made this wish reality after experiencing a powerful vision that had followed his 1675 detention.

The Pueblos' plot to drive out the Spanish unfolded on August 9, 1680, when runners carried knotted cords and instructions to two dozen villages as far south as Isleta in New Mexico, a distance of some 400 miles. Tribal leaders receiving the knotted yucca cords were instructed to untie one knot each day until none remained. After the last knot was untied, the warriors would attack the Spanish.

Gov. Don Antonio de Otermín downplayed the seriousness of the planned uprising on learning about it from native informants. The rebellion, Otermín had learned, was to begin during the night of the new moon. In addition, the attacks would coincide with the arrival of the triennial Spanish supply caravan dispatched from Mexico City. The governor then ordered the torture of Nicolás Catua and Pedro Omtua, captured runners from Tesuque, for further details. Confident that the uprising would not commence until August 13, 1680, Otermín adopted a strategy of watchful waiting.

Pueblo raiders, however, attacked unsuspecting Spanish outposts on August 10, 1680, after learning that the Spaniards had captured the two runners. The stunned Otermín responded by dispatching soldiers to subdue the warriors. In addition, Otermín ordered all Spanish colonists to gather within the safe confines of Santa Fe's defenses.

Spanish settlements in northern New Mexico as far west as the Hopi mesas in present-day Arizona felt the fury of war. The uprising claimed the lives of 19 Franciscan friars and 2 assistants. In all, some 380 Spaniards, including women and children, perished. Alonso García, New Mexico's lieutenant governor residing in Ro Abajo, learned about the devastation on August 11. On the receipt of false reports that all Spanish settlements had been destroyed in the attack and that no colonists had survived, García organized a withdrawal of all remaining Spaniards in the region to El Paso del Norte (modern Juárez) instead of marching north to the settlers' relief.

Governor Otermín, waiting at Santa Fe for reinforcements that never arrived, prepared for a long siege. Nearly 500 Pueblo warriors attacked the capital of New Mexico on August 15, 1680. Within two

Photograph of the ruins of the Spanish mission at Pecos Pueblo, seat of the 17th century Pueblo Revolt in New Mexico. (North Wind Picture Archives)

days more than 2,500 Pueblos had joined the fight. Otermín, severely wounded in a desperate counterattack designed to drive off the attackers, abandoned Santa Fe on August 21 after the attackers cut off the city's water supply. The Spaniards then withdrew down the Rio Grande River Valley.

After the Spanish had departed, Popé and other leaders of the rebellion launched a purification campaign, destroying Catholic churches, statues, and relics. All Pueblos who had received the sacraments were ordered to cleanse themselves by scrubbing their bodies with yucca fibers while bathing in the Rio Grande. Pueblo traditionalists constructed kivas (partially subterranean ceremonial chambers) to replace those that the Spanish colonizers had earlier destroyed.

Otermín attempted to reclaim New Mexico for Spain in November 1681, but Pueblo warriors repelled his invading forces. Spain's interest in New Mexico waned until French explorers visited the lower Mississippi River Delta. Eager to secure the Southwest lest it fall to France, Spanish officials dispatched soldiers there in 1688 and 1689. Although unsuccessful, these expeditions revealed fissures in Pueblo civilization. Officials also learned that Ute, Apache, and Navajo raids, combined with drought and famine, had created severe hardship for the

Pueblos. On August 10, 1692, 12 years to the day of the Pueblo Revolt, Gov. Diego José de Vargas vowed he would retake New Mexico.

By September 13, 1692, a force of 40 Spanish soldiers, 50 Mexican natives, and 2 missionaries reached Santa Fe. Vargas, anxious to assure the defenders that he meant them no harm, pardoned Tewa leaders for their past transgressions. Amazingly, the governor eventually entered the city without having to fire a shot. Maintaining constant vigilance, Vargas also visited the outlying pueblos to assure villagers of his desire for peace.

Despite the governor's efforts, violence returned to the region in 1693, when hostile Pueblos recaptured Santa Fe. A furious Vargas retook the city on December 29, 1693, after cutting off the defenders' water supply. The governor's reconquest of New Mexico ended in December 1696, when Vargas secured a lasting peace. Although the Spanish colonizers and missionaries returned, they had learned an important lesson. After 1696, the villages were allowed to govern themselves and the missionaries tolerated residents' traditional practices. Thus the Pueblo Revolt of 1680 had succeeded in ensuring the perpetuation of cherished tribal languages, dances, and ceremonies for centuries to come.

Pueblos

Native American groups that lived along the upper reaches of the Rio Grande Valley in the American Southwest (principally in modern-day New Mexico). The Pueblos had prospered for thousands of years prior to European contact. Population estimates vary, but their numbers probably reached as high as 60,000, divided into 80 towns, by the end of the 16th century. With sufficient water to sustain agriculture, the Pueblos cultivated maize, beans, and squash and used artificial means to irrigate their crops. They dwelled in terraced apartment-like buildings built of adobe and stone, which were usually two to three stories high. Towns were often situated on elevated terrain (cliffs and mesas), offering ideal security for the community. The group was called "Pueblo" because it resided in permanent settlements, or *pueblos* in Spanish.

Pueblo government was theocratic, and ceremonial life dominated community affairs. Each pueblo was politically autonomous, with leadership originating from the community's priesthood. This reality, along with the presence of multiple languages and dialects (Keresan or the Tanoan tongues: Tano, Tewa, Tiwa, or Towa), made collaboration between pueblos very rare.

In the early 16th century, the viceroy of New Spain authorized expeditions north of Mexico in hopes of discovering riches rumored to be found among the adobe towns scattered across the landscape. Francisco Vásquez de Coronado, governor of the province of New Galicia in northern Mexico, led the largest of these expeditions from 1540 to 1542. With approximately 300 Spanish cavalry and infantry and more than 1,000 Tlaxcalan warriors, Coronado journeyed up the Rio Grande into the land of the pueblos. He found none of the anticipated opulent cities. Instead, the Spanish conquistadors discovered desert towns of stone and mud-plastered dwellings whose stores of maize and beans offered inviting targets for raids and consumption.

Despite the efforts of the Pueblos to welcome the strangers, conflict was commonplace. Resistance to Spanish incursions proved

futile at Zuñi Pueblo, where Spanish horses, lances, and guns overwhelmed Zuñi attempts to protect their foodstuffs. At the Tiwa Pueblos, the approaching winter led Coronado to commandeer buildings, clothing, and food supplies for the benefit of his soldiers. Tiwa resistance to these demands instigated three months of merciless Spanish reprisals. When Coronado's expedition returned to Mexico in 1542, after venturing all the way to present-day Kansas, it left behind a wide swath of brutality and devastation among the pueblos it had encountered.

Coronado's accounts of his profitless expedition dissuaded further forays into pueblo country for more than half a century. In 1595, Don Juan de Oñate, the son of a wealthy silver mine owner, was charged by the Spanish court with leading an expedition up the Rio Grande to spread the Catholic faith, pacify the natives, and establish a permanent colony in the northern provinces of New Spain. In 1598, Oñate and 500 men, women, and children entered New Mexico near present-day El Paso, Texas, and claimed dominion over the land and its people. By late May 1598, Oñate reached the upper Rio Grande and encountered the first of many pueblos he would formally claim for Spain. Despite the expedition's habit of requisitioning food from the pueblos it encountered, the indigenous population generally welcomed the newcomers—choosing to suppress the memory of Coronado and any desire for retribution.

In July 1598, Oñate arrived at the confluence of the Chama River and the Rio Grande and established his headquarters at Ohke Pueblo, which he renamed San Juan—the capital of the new colony. From San Juan, Oñate inaugurated his missionary program by dispersing friars to the pueblos while he personally conducted a reconnaissance of the province. Native hospitality turned to resistance at Acoma Pueblo in January 1599, leaving 11 Spanish soldiers dead. In retaliation, Oñate sent a punitive expedition against the town, which killed 800 men, women, and children and took another 580 captive. Adolescents were sentenced to 20 years of servitude while adult men were subjected to public mutilation to be conducted in the plazas of pueblos along the Rio Grande. In 1601, Oñate moved the capital across the Rio Grande to Yunque Ouinge Pueblo and renamed it San Gabriel. Nine years later, the capital was moved again, this time to its permanent location in Santa Fe.

By 1610, the realization that there were few riches to be found among the pueblos led many colonists to return to Mexico and offered little incentive for new colonists to venture northward. Those who remained in New Mexico lived in scattered settlements along the Rio Grande and profited from the exploitation of native labor.

For the Pueblos, the 70 years following the establishment of the Spanish capital at Santa Fe proved intolerable. Spanish labor demands on native people were burdensome. Native children were placed into permanent servitude, Franciscan friars strove to abolish Pueblo religious icons and ceremonies, epidemic diseases became rampant, and, to make matters worse, Apache, Ute, and Navajo raiding parties preyed on Pueblo livestock. Sporadic revolts against the Spanish materialized on occasion in isolated pueblos

but were easily put down mostly because of the lack of cooperation between the native towns.

All this dramatically changed in 1680, when Popé, a spiritual leader from San Juan Pueblo, led one of the most effective native revolts in American history. Popé successfully overcame obstacles created by distance and language barriers to unify at least 24 pueblos in a coordinated revolt against the Spanish in early August 1680. His 8,000 followers killed more than 400 Spanish colonists and 21 of the 33 Franciscan friars. Those Spaniards who were not killed or wounded fled back to Mexico while the victors destroyed the vestiges of Spanish rule.

The success of the Pueblo Revolt kept the upper reaches of the Rio Grande free from Spanish control for 12 years. The Pueblos' alliance was short lived, however, as native towns soon returned to their familiar practice of autonomy. When the Spanish under Diego de Vargas returned to New Mexico in 1692, the Pueblos responded with minimal resistance. What opposition the Spanish did encounter was quickly suppressed. Effective Spanish control of the province resumed in 1694, but with a decidedly different approach toward the Pueblos.

Natives were now allowed to retain their religious icons and ceremonies. Labor and food requisitions were moderated. Spanish officials went so far as to arm the pueblos to help them ward off raiding tribes. Throughout the remainder of the colonial period, the land of the Pueblos was spared the repressive policies of the pre-1680 colonists and quickly evolved into a military buffer zone protecting Mexico's northern provinces from native and European incursions. Ironically, what emerged, in effect, was a Pueblo-Spanish alliance that helped to preserve Pueblo culture for generations to come.

Puritans

Term, originally an epithet, referring to individuals who sought to rid the Church of England of any vestiges of Catholic ritual and hierarchy. The term "Puritans" refers variously to wings of radical 16th-and 17th-century English Protestants who adhered to the rigid doctrines of John Calvin. Indeed, they sought to "purify" the Anglican Church of all things Catholic. A few branches of Puritanism did emerge with slightly differing ideas about church governance. But all agreed on the diluting of ecclesiastical authority, ranging from radical independence to Presbyterianism. They were also broadly divided between a mainstream that never disavowed its connection

to the Church of England and a Separatist fringe eventually led by Robert Browne (1550–1633).

The Separatists became known by their contemporaries as "Brownists." Many of them fled England for the Netherlands and other parts of Europe during the reign of Queen Mary (1553–1558), a Catholic. Some found their way to Geneva, Switzerland, where they sought to refine their Calvinist theology under the tutelage of John Calvin.

On Queen Mary's death and the accession to the throne of Elizabeth I in 1558, all but the Puritans returned to England in order to participate in the process of Reformation begun by Henry VIII. Nevertheless, Elizabeth made it clear that she was not favorably disposed to their religious opinions. A steadily mounting atmosphere of official persecution ensued and accelerated during the reigns of James I (1603–1625) and Charles I (1625–1649).

The Separatists in Holland, concerned that their children were gradually losing their English identity, became determined to reestablish themselves in the New World. Thus, they formed the Plymouth Company under the leadership of William Bradford, which was granted a charter in 1619. Aboard the *Mayflower*, the "Pilgrims," as they called themselves, landed at Cape Cod in modern-day Massachusetts in 1620. There they established Plymouth Plantation.

Encouraged by this example and frustrated by their straitening circumstances, the Puritans began considering the prospect of founding an American colony of their own. Their effort was spearheaded by John Winthrop, who founded the Massachusetts Bay Company and secured a royal charter for a colony in New England in 1629. Carried to the New World in the *Arabella*, Winthrop's settlers sailed in the Massachusetts Bay area in 1630 and founded a colony by that name that he hoped would be a "city on a hill" for the rest of the world—primarily England—to emulate.

To that end, the initial form of government in the Puritan colonies of New England was dependent on its congregational church organization. That governance established strict standards for achieving church membership and the sociopolitical perquisites conferred by it. Most important in that regard was the right to vote and hold elective office in the towns and the assembly. Although clergy were barred from elective office, thus avoiding the creation of a theocracy, neither were the Puritan colonies democratic. Magistrates, for example, did not believe that they represented voters or the general population. Bradford and Winthrop both envisioned a holy commonwealth, but that never precluded a robust commercial activity. That, along with the New Englanders' shared sense of religious purpose and demographic balance, created healthy and economically successful communities in relatively short order.

These success stories resulted in the "Great Migration" of Puritans and other Britons to New England throughout the 1630s. Growing through natural population increases and steady immigration, towns and villages sprung up quickly. Encroaching white settlements pushed inexorably westward into lands claimed by the Massachusett, Pawtuxet, Pequot, Narragansett, and Wampanoag

Illustration showing Puritans barricading their house against Native American attackers. Conflict between Native Americans and New England colonists was common in the early colonial period. (Library of Congress)

peoples. In short order, the American Indians of the region had been decimated by disease and wars between themselves and the English over land and trade.

The Pequot War (1636–1638) brought the Pequots to the edge of extinction, and King Philip's War (1675–1676) swept away what little Southern Algonquian resistance still remained. By the 1680s, New England's frontiers stretched into French-allied Abenaki lands in New Hampshire and Maine. And territory claimed by the Dutch-allied Mohawks and Mahicans in western Massachusetts and Connecticut inevitably enmeshed the Puritan colonies in international imperial rivalries. These tensions sparked a series of colonial wars for over a century between 1652 and 1763.

Although New England Puritanism moved away from the radical Calvinism and idealism of the founding generation, it never relinquished its eschatological sense of purpose as the "New Canaan" in the 18th century. The revivalism of the Great Awakening (ca. 1735–1745) served to reinforce this mentality. Such was especially the case with the interpretive influence of the "New Light" theologian Jonathan Edwards (1703–1758) of Massachusetts, among others. The French and Indian War (1754–1763) against Catholic France and pagan natives took on a critically apoc-

alyptic significance in New England, as the clergy exhorted their male parishioners to enlist in provincial regiments. Indeed, they were exhorted to combat the "Enemies to God, to Religion, Liberty, and the pure Worship of the Gospel," in the words of Sylvanus Conant. The victorious conclusion of the war in 1763 inspired Puritan thinker Jonathan Mayhew to envision "mighty cities rising on every hill," thus evoking the language and ideals of Winthrop.

Pynchon, John

Born: ca. 1622

Died: January 17, 1703

Influential politician and military leader in Massachusetts Bay Colony. John Pynchon was born around 1622 in Essex, England. In 1630, Pynchon's family migrated to the Massachusetts Bay Colony. Pynchon was educated by his father, William Pynchon, founder of Springfield, Massachusetts. The younger Pynchon worked in the fur trade and other mercantile pursuits. He was first elected to local public office in 1650, took over the leadership of Springfield when his father returned to England the following year, and went on to hold nearly every local position during his lifetime.

In 1657, Pynchon was appointed commander of all military forces in western Massachusetts with the rank of captain. He oversaw construction of the Old Fort at Springfield in 1662. He was promoted major for western Massachusetts in 1669 and oversaw its defenses until 1695.

Pynchon's military career was uneventful until King Philip's War (1675–1676). As commander of a combined force of Massachusetts and Connecticut troops, he sought to defend a vast area from native attack. On October 5, 1675, the natives struck Spring-

field. Forewarned of the attack, Pynchon and his men marched back from Hadley to relieve the town. Arriving in mid-afternoon of the same day, they forced the native attackers to withdraw, but by then most of the town had been destroyed. A few days later, Pynchon received word that Massachusetts officials had granted his earlier request to resign his command, which he turned over to Captain Samuel Appleton.

On the formation of the Dominion of New England in 1685, Pynchon participated in the new government, serving on the council headed by Sir Edmund Andros until the dominion came to an end in 1689. Pynchon's association with the unpopular dominion government ended his political influence. Pynchon died in Springfield, Massachusetts, on January 17, 1703.

Q

Quaker Pacifism

Religiously based aversion to war and violence as practiced by the Religious Society of Friends, or Quakers. Pacifism among the Quakers has been considered a fundamental tenet of the sect, although such was never exactly the case. George Fox (1624–1691), the founder of the pietistic sect in England, only preached Christian meekness and humility. That, however, led to an inclination toward pacifism espoused by later 17th-century Quakers. British Quakers gradually adopted pacifism as a spiritual requisite for membership. Pacifism, as part of their avoidance of worldliness and materialism, was consistent with a theology that resonated deeply with the poor and the dispossessed.

Quaker missionaries traveled to the North American colonies, where they faced resistance, harassment, and persecution, most notably in New England. Those Quakers who followed William Penn (1644–1718) to the founding of West Jersey and Pennsylvania in the 1680s went to flee persecution, to capitalize on economic opportunities, and to Christianize the natives. In Pennsylvania, they prospered. Some became quite wealthy as businessmen and merchants, gradually abandoning many of their religious principles in the first decades of the 18th century. They tended to spurn their religious beliefs as they came to control the colony's assembly. They also indulged in epicureanism (withdrawal from the world to pursue self-interest), which drew the sharp criticism of reformers who led a movement to reform American Quakerism and bring it back to its roots.

Quakers found themselves conflicted over serving in the colonial government, for the obvious reasons that it could—and often did—violate their pacifist and Christian beliefs. Nonetheless, a stable Quaker political faction arose in the 1720s, which William

Penn's son Thomas ardently opposed. Quaker ethics against war caused problems with regard to defending Pennsylvania's frontier. And Thomas Penn became exasperated with Quaker grandees in the assembly who continued to be elected by German and Scots-Irish settlers in the west. These Quakers had discarded their pacifism, thus creating an internal schism that caught the attention of the reformers. Soon, the reform faction successfully campaigned to reduce Quaker involvement in colonial government.

The French and Indian War provided the most potent catalyst for the Quaker withdrawal from government, though it was never total. Friends in the assembly had been appropriating funds that they knew were being used for fighting wars. This exposed the divide between pacifist and nonpacifist Quakers in the assembly. Penn and the proprietary faction were able to turn Quaker obstruction of war appropriations bills to their advantage in London. There Quakers were made to look like inveterate pacifists unwilling to defend frontier settlers. The influence of the reformers in Pennsylvania was too great, however, and thus began the Quaker exodus from political domination of the colony.

What occurred between 1755 and 1758 was, under the influence of the Quaker reformers, an assertion of pacifism and the shift from its being a personal and communal pledge against violence to the rejection of any advocacy of violence in any direct or indirect form. Quaker control over Pennsylvania politics collapsed at this point under reformist pressures, though they were soon embroiled in the contentions that brought on the American Revolutionary War in 1775.

Quapaws

Native Americans whose territory covered the lower Mississippi River Valley near its confluence with the Arkansas River in present-day Arkansas. Quapaw territory abutted that of the Osages in north-western Arkansas. Their Algonquin neighbors referred to the Quapaws as the Akanseas, leading the French to call them Akensas or Akansas. It is believed that the Quapaws had once lived east of the Allegheny Mountains but, pressed by other native groups, moved first west and then down the Ohio River.

The Quapaws' first contact with Europeans occurred in 1541, when Spaniard Hernando de Soto came upon their palisaded and moated principal town, which reportedly contained several thousand people. The Quapaws' next contact with Europeans was in 1673, when Frenchmen Louis Jolliet and Jacques Marquette visited Quapaw settlements near the juncture of the Mississippi River and Arkansas River. When French explorer René-Robert Cavelier, Sieur de La Salle, passed by in 1682, the Quapaws had five villages situated along both waterways. La Salle negotiated a treaty of peace with the Quapaws and claimed the territory for France, and other Frenchmen tried to convert the Quapaws to Christianity.

For the most part, Quapaw-French relations were cordial. Indeed, because of the strategic location of their territory, the French went to considerable lengths to assure the Quapaws' allegiance. The French realized early on that a key to controlling the Mississippi Valley was cordial relations with its native peoples.

The Chickasaws were perennial rivals of the Quapaws. When they fought the Chickasaws, the Quapaws actively advanced French interests. Indeed, keeping the British-allied Chicaksaws on the defensive helped alter the Franco-British balance in the region. During the Natchez War (1729–1733), in which the French practically destroyed that tribe, the Quapaws fully backed the French. In 1739–1740, the French set out to decimate the Chickasaws and lay exclusive claim to their territory. Toward that end they amassed an army of up to 3,600 men, including several hundred eager Quapaw warriors. Several months into the campaign, however, the Quapaws left the expedition, which had failed to make contact with the Chickasaws. During the French and Indian War (1754–1763), the Quapaws remained steadfast French allies, although their small numbers meant they had little impact on the outcome.

The Quapaws numbered between 5,000 and 10,000 people at first European contact. A virulent outbreak of smallpox in 1698 killed a large majority of them, however. Subsequent wars, reloca-

tions, epidemics, and general decline reduced Quapaw numbers to 3,200 in 1687, 1,600 in 1750, and just 700 in 1763. Indeed, by 1763 the Quapaws had dwindled to the point that they inhabited only three tiny settlements along the Arkansas River. Nevertheless, their sliver of territory proved rich in zinc and lead deposits. By the 1920s, the few surviving Quapaws were enjoying substantial royalties from the lease of mining rights.

Quartering

The housing of military forces either in publicly or privately owned civilian quarters. In Europe, large standing armies became commonplace in the late 16th and early 17th centuries. To reduce the financial strain of housing these troops, governments quartered soldiers in taverns, public halls, vacant buildings, and private residences. In the latter case, such troops might either fraternize with or alienate the householder. Government reimbursement, if it came at all, was often slow and usually inadequate to cover all costs.

Desperately in need of funds to finance his unpopular foreign policy, England's King Charles I (1625–1649) had resorted to forced loans and the quartering of troops in private homes. Arrests and imprisonments that had followed opposition to these policies caused great anger in Parliament, which then forced the king to sign the Petition of Right in 1628. Based on earlier statutes and legal precedents, it provided there could be no taxation without consent of Parliament, that no citizen could be imprisoned without just cause (reaffirming the writ of habeas corpus), there could be no martial law in time of peace, and that no troops could be quartered in private homes. In return for Charles's acceptance in June 1628 of the Petition of Right, Parliament agreed to grant the king subsidies. The practice of quartering continued on the continent of Europe, however

In North America, most military forces were militia, but the lack of public facilities and a paucity of barracks meant that there was more or less a constant need to quarter regular troops in private homes, especially in wartime. Colonists balked at the practice, however, and worried aloud that it would lead to the usurpation of civilian authority. Quartering became a major issue during the French and Indian War (1754–1763), when large numbers of British troops were sent to North America. For example, in 1755, the attempt of

the British commander in America, Major General Edward Braddock, to quarter troops in Philadelphia encountered fierce opposition in the province's assembly and roused the ire of Benjamin Franklin, among others. During 1756–1757 the residents of Albany, New York, objected en masse to British plans to quarter up to 2,000 troops in the town.

In the decade after the French and Indian War, the British government was heavily in debt. At first, Parliament clumsily attempted to revive the practice of quartering as a way to get the colonies to help reduce the costs of maintaining a force in America to provide for defense against the natives. The British colonists objected vociferously.

The Quartering Act took effect in March 1765. Under this decree, the colonial legislatures had to furnish British soldiers with barracks, bedding, firewood, cooking utensils, staple provisions, and cider. In 1766, Parliament required billeting in inns, taverns, and vacant buildings. No specific mention of housing troops in private residences was made. Nevertheless, many colonists objected, and the legislature of New York overtly refused to comply with the act.

Ill will persisted on both sides, but there were no new quartering acts passed until 1774, when Parliament enacted the Coercive Acts, known to the colonists as the Intolerable Acts. Primarily directed at Massachusetts, these included a new quartering measure. The decree restated the older acts and added that troops would be quartered in occupied dwellings as well as empty ones and in commercial establishments. Colonists objected bitterly to the lack of privacy as well as to the general concept of standing armies, which they tended to see as instruments of government repression. Thus, the issue of quartering would become an issue worth citing in the Resolves of the First Continental Congress. Indeed, the quartering controversy was one of the fuses that set the American Revolution afire.

Quartering Act Crisis

Start Date: March 1765 End Date: October 1767

Showdown between New Yorkers and British Army regulars over the quartering of troops that lasted from March 1765 to October 1767. Following on the heels of the Stamp Act Crisis, the Quartering Act Crisis brought New York colonists and British regulars to the brink of armed conflict in the summer of 1766.

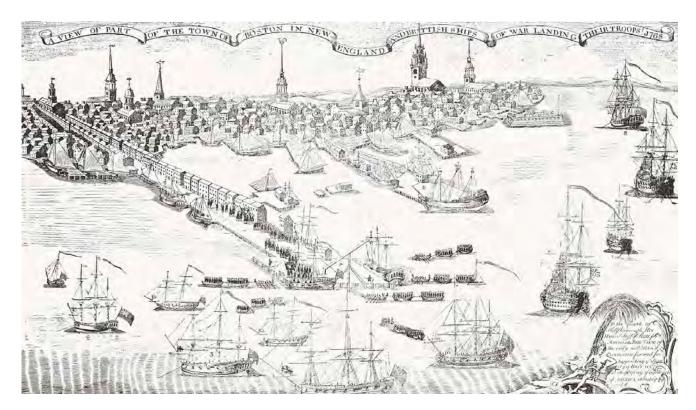

In March 1765, at the request of the British commander in chief in North America, Major General Thomas Gage, Parliament enacted the Quartering Act to provide organization for the provision and housing of regular troops in North America. Previously, troops had been billeted and supplied by local magistrates, who placed them in public buildings, taverns, and occasionally even private homes. Instead, London officials mandated that troops be supplied with a specific list of provisions and shelter, omitting any reference to billeting troops in private homes. All arrangements for housing and supplying the troops had to be authorized by colonial legislatures rather than local authorities.

In 1765, most of the British regulars stationed in America occupied forts along the western edge of British settlement. The British government's reorganization of its administration in the American colonies, however, resulted in the deployment of more troops to the well-settled towns along the eastern seaboard, with New York (Gage's headquarters) containing a full battalion by the spring of 1766. Despite tension over the Stamp Act and disgruntlement that a standing army was stationed among them in peacetime, all of the colonial assemblies made adequate provisions for the troops under the new law. None of them, however, followed the letter of the law precisely or openly acknowledged the new law.

In New York, though, trouble was brewing between the swelling ranks of British soldiers and the colonists. Gage had already been stymied by the legislature in the matter of housing troops stationed in Albany in the winter of 1765–1766, although adequate facilities were eventually found for these men. In June 1766, the legislature once again balked at complying with the Quartering Act, stating that the high number of troops stationed in New York placed an unfair burden on the colony. By the end of the month, the legislature had voted to appropriate nearly £4,000 for military supplies, although legislators evaded any explicit acceptance of the Quartering Act. Gage accepted the money out of necessity, but he warned his superiors in London that the colonists were displaying an alarming degree of independence.

Meanwhile, tensions between colonists and troops ran even higher in New York City. After the legislature refused outright compliance with the Quartering Act, New Yorkers erected a liberty pole, which had been such a symbol of defiance to the Crown during the Stamp Act Crisis. On August 10, 1766, a group of soldiers tore down the pole, sparking a riot the following day between the soldiers and more than 2,000 colonists. Although British officers and local officials managed to restore order, the liberty pole remained a point of contention between the troops and colonists through much of the fall.

In December, the New York legislature refused to allocate more money for troop support. Gov. Henry Moore cajoled the group, however, and in June 1767 the legislature finally appropriated Gage another £3,000. By this point, the ministry in London had

The landing of British troops at Boston, October 1, 1768. Line engraving from the same year by Paul Revere. (The Granger Collection)

decided to make an example of New York. Parliament enacted the Restraining Act, disallowing any legislation from the New York Assembly passed after October 1, 1767. The assembly voted another £1,500 to support the troops in a bill with a conciliatory preamble that still never explicitly accepted the Quartering Act. Moore painted the grant in the best possible light to his superiors in London. The whole issue died down quietly after October 1767, particularly as the ministry found itself occupied with enforcing the newly enacted and much-hated Townshend duties.

Quartermaster General

The individual assigned to oversee the supply system for an army. During the colonial era, the supply system used by European armies underwent revolutionary changes. In part, the changes were spurred by a massive growth in the size of European armies. At the height of the Thirty Years' War (1618–1648), Gustavus Adolphus of Sweden and Albrecht von Wallenstein of Bohemia each commanded armies of more than 100,000 men. Under Louis XIV, the French peacetime army numbered more than 150,000; and field armies greater than 100,000 became routine. Keeping such large armies fed, clothed, and sheltered required a sophisticated and extensive logistical system. Huge armies simply could not forage or plunder for subsistence in the manner of smaller forces. Commanders who could not supply their troops also could not maintain discipline or prevent desertion or mutiny.

Wallenstein revolutionized the supply system by enforcing cash contributions on the inhabitants of a region through which his army passed, which could then be used to provision the army and be repaid by the treasury at a later date. This streamlined the supply system, but an army still needed to remain in motion lest it exhaust the resources of the countryside. Because armies fed themselves as they moved rather than relying on a base, there was no way to cut the supply lines of an army in motion.

The quartermasters of each army oversaw the collection and distribution of supplies. In the event that sufficient resources could not be found in the area of operations, as happened during virtually every siege, quartermasters coordinated the transportation of supplies to the army. These circumstances made control of waterways vital to any army. By the 1640s, the use of magazines, prestocked supply depots arranged along an army's planned route, became prevalent in Europe.

In the North American colonies, the armies were much smaller than those found in Europe in the same time period. As such, the supply difficulties were of a much smaller magnitude. This did not exempt colonial forces from logistical problems, however. Maintaining an army in the field was beyond the capability of all but the most gifted commanders, and the failure of supply systems doomed many expeditions. During King William's War (1689–1697), New England colonists successfully besieged Port Royal in Acadia, relying on water transportation to keep the army supplied. During Queen Anne's War (1702–1713), English advances on St. Augustine and Pensacola failed for lack of supplies, as did the Spanish counterattack at Charles Town (present-day Charleston), South Carolina.

During the French and Indian War (1754–1763), the British and French governments each attempted to increase colonial participation by reimbursing colonies for their expenditures in the war. English colonists insisted on maintaining separate supply systems for provincial troops as a means of maintaining autonomy from royal authority. The supply situation prolonged the conquest of Canada, forcing the cancellation of a planned assault on Montreal in 1759 and almost preventing the campaign of 1760. The increased size of armies in the American Revolutionary War (1775–1783) only increased the pressure on North American quartermasters, and troops on each side of the war suffered from the lack of a well-organized supply system.

Quebec

The capital of New France and its principal port. Quebec is situated on a vitally strategic location astride the St. Lawrence River. The city's commanding promontory, Cap-aux-Diamants, affords an unrestricted view of the St. Lawrence and serves as a natural fortification. As the military, civil, and ecclesiastical center of New France, Quebec played a pivotal role in the exploration and settle-

ment of French North America. It also figured prominently in each of the colonial wars between Britain and France.

Quebec's origins date to 1534, when French explorer Jacques Cartier sailed from St. Malo, France, with orders to enter the Bay of Castles (between Labrador and Newfoundland) and search for a water route to Asia. While exploring the region and taking Native American captives, Cartier discovered the mouth of what he named the St. Lawrence River. He then returned to France for supplies. On another voyage the next year, Cartier sailed up the St. Lawrence and anchored at a place the local Iroquois called Stadacona, which translated as "narrowing." The village sat on the northern shore of the St. Lawrence, below the impressive heights on which Quebec City was eventually built. It was also at the junction of the St. Lawrence River and the St. Charles River. The site was ideally located for both transportation and defense.

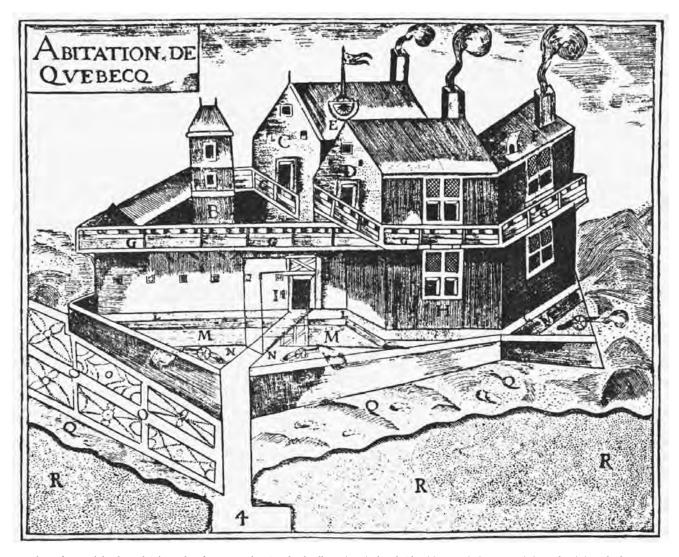

Cartier left his main party at Stadacona before pushing upriver to a village called Hochelaga, which he renamed Mount Royal (and which eventually became Montreal). Above Hochelaga, Cartier turned back in the face of the Lachine Rapids. He returned to Stadacona to winter in a fort built by his expedition, which he dubbed St. Croix. The fortification was the first military structure in New France, and it featured both a defensive ditch and artillery.

Unfortunately, the site became a winter nightmare when the St. Lawrence froze over. Twenty-five of Cartier's 60 men died of scurvy before local Native Americans showed him the secret of boiling cedar bark to produce vitamin C. The French responded by kidnapping 10 natives and sailing for home in 1536. War between France and Spain prevented Cartier's return until 1541. He then attempted to found a colony at Stadacona, but ultimately it failed.

French efforts to build on Cartier's exploits languished until the early 1600s, when Samuel de Champlain established Quebec City on the heights above Stadacona in 1608. The city totally commanded the St. Lawrence River, which Champlain realized was the key to the entire inland water system of northern North America. It quickly became the primary port city and trading post in French Canada. It was also a center for French settlement and the lucrative fur trade. At the same time, the unparalleled strategic location and economic importance of Quebec made it a prime military position. As such, the French fortified both the landward and river approaches to the city throughout the 17th and 18th centuries.

Although the city grew slowly, boasting a population of only 3,418 people in 1666, it was the export center for the vast fur-trading empire of New France. It also served as a base of operations for an expanding number of Recollet and Jesuit missionaries. When Quebec became the capital of New France in 1663, it added further political, civil, and ecclesiastical dimensions to its already unsurpassed economic and military importance. And it became an even greater focal point during all of the wars between Britain and France in North America.

The English attacked Quebec successfully in 1629, but subsequent attacks in 1690 and 1711 failed. The decisive battle for Quebec and New France occurred on the Plains of Abraham just

Woodcut of Samuel de Champlain's Quebec fort, 1613, showing the dwellings (C, D), drawbridge (I), moat (M), cannon (N), garden (O), and other features. (North Wind Picture Archives)

above the city in 1759. It ended in the British capture of Quebec, the decisive point in the French and Indian War. When the war concluded in 1763, Great Britain demanded virtually all of New France, and Quebec became part of the British Empire.

Following the English conquest, most of the French settlers in New France and in Quebec elected to stay. In the Quebec Act of 1774, they were guaranteed rights and privileges for the Catholic Church, a return of French civil law, representative government, and boundaries for their territory that extended to the Ohio River and the Mississippi River. These rights served as a major antagonism for British colonists in the lower 13 colonies of North America. In the end, the act played a not insubstantial role in triggering the American Revolutionary War in 1775.

Quebec, Attack on

Event Date: 1629

Assault on Quebec by English paramilitary forces in 1628–1629 and an extension of the Third Huguenot War between England and

Samuel de Champlain surrendering Quebec to the English, July 19, 1629. (The Granger Collection)

France. In the wake of this religious conflict, King Louis XIII's minister, Armand Jean du Plessis, Cardinal Richelieu, prohibited all non-Catholic immigration to New France. He also reorganized and recapitalized French holdings in North America through the formation of the Compagnie des Cent-Associés (Company of 100 Associates). Richelieu named Quebec's founder, Samuel de Champlain, as chief administrator.

Early in 1628, Richelieu amassed a convoy at the port of Dieppe to carry supplies to New France as well as several hundred settlers to serve as the advance element of an accelerated colonization plan. At the same time, however, and empowered by a letter of marque from English king Charles I, the Huguenot turned London merchant and privateer Gervase Kirke set out to capture Quebec from the French.

Kirke's flotilla, led by his sons David, Lewis, Thomas, John, and James, consisted of three ships carrying in all 200 men. It set sail for Canada well ahead of Richelieu's convoy. On the way, the Kirkes captured several French warships and fishing vessels. The expeditionary force then continued up the St. Lawrence River, taking the trading outpost of Tadoussac on July 10, 1628. This they accomplished with the help of local natives and disaffected French traders put off by Champlain's brusque administrative style.

David Kirke then sent several envoys upriver to deliver a surrender demand to Champlain, who responded with defiance. Kirke in turn informed Champlain that his force would return early the next year. He also said that he would cut off French supplies during the winter, expecting that this would make Champlain amenable to surrender. Departing for the Gulf of St. Lawrence, Kirke's ships then imposed a naval blockade for the remainder of the season, in the process seizing Richelieu's convoy of 11 ships with 600 crewmen and colonists. In the autumn of 1628, with the St. Lawrence River about to freeze over, thereby cutting off Quebec from waterborne resupply, Kirke and his men sailed for England.

The winter of 1628–1629 was severe, and Champlain and inhabitants of Quebec, who numbered fewer than 100 people at the time, avoided death by freezing or starvation only through the charitable actions of France's Native American allies, the Hurons. In the spring as promised, Kirke returned with an enlarged fleet and again blockaded the St. Lawrence. With Quebec having fewer than 20 men under arms, Champlain was forced to capitulate on July 19, 1629. Having ostensibly achieved the conquest of Canada, the Kirkes garrisoned the fort and then took Champlain and the rest of Quebec's inhabitants back to England.

On his arrival in London on October 29, 1629, Champlain sought out the French ambassador, from whom he learned that war between England and France had ended with the Treaty of Susa on April 29, 1629. By December, Champlain was in Paris, lobbying Richelieu and Louis XIII for the return of Canada to French control. However, because of diplomatic hurdles following the peace, Quebec was not officially returned to France until the signing of the Treaty of St. Germain-en-Laye on March 29, 1632.

In July 1632, a French ship carrying some 40 settlers, as well as the Jesuit priest Paul Le Jeune and the new French governor, Emery de Caen, arrived at Quebec. After handing the settlement over to de Caen on July 13, the remaining Kirke brothers and their men returned to England, but not before pilfering a large stockpile of beaver pelts as well as furniture, window frames, and anything else they could pry from the ruins. As Le Jeune later noted, all that was left of the nearly 30-year French effort to colonize Canada was a ransacked fort and some dilapidated stone walls.

The 1629 capture of Quebec was highly significant for the future development of North America. French dreams of colonization were set back decades by the destruction wrought by the Kirkes. Although returned to France almost as an afterthought, Quebec in French hands proved to be a threat to English America for the remainder of the colonial period. Furthermore, the events of 1629 led Richelieu to replace the Recollet order with the Jesuits as the primary Catholic proselytizing force in North America. This was a development that would deeply affect the course of North American colonial warfare and have far-reaching consequences for native groups and European settlers alike. Finally, the native alliances that had been formed by the English and French respectively were thrown into disarray by Champlain's capitulation, leading to all-out war between New France and the Iroquois Confederation.

Quebec, Attack on

Start Date: October 18, 1690 End Date: October 25, 1690

The first major English campaign during King William's War (1689–1697), in October 1690. In response to French frontier raids, New York and New England organized a two-pronged invasion of New France. It combined a seaborne assault against Quebec with a secondary force advancing on Montreal from Lake Champlain. Massachusetts appointed Major General Sir William Phips commander of the Quebec expedition.

The New England colonies raised more than 2,300 men, but Phips waited in vain for additional supplies from England while the campaign season slipped away. Finally, on August 9, 1690, Phips and his army set sail for Quebec aboard 34 vessels. It was the largest colonial military expedition to that point.

In New France, Governor-General Louis de Buade, Comte de Frontenac, had left Quebec virtually undefended in order to stave off the English attack against Montreal. On October 10, when he learned of Phips's departure, he raced back to Quebec with reinforcements, hoping to beat the English to the city. Fortunately, the British Army on Lake Champlain disbanded. This allowed Frontenac to shift nearly all his forces and call out the militia throughout the St. Lawrence River Valley.

Frontenac and the first reinforcements reached Quebec on October 14. Phips's fleet arrived two days later. Quebec's defenses grew stronger every day. Soon they boasted nearly 3,000 men.

Phips sent Major Thomas Savage ashore to demand Quebec's immediate surrender. The French escorted the blindfolded officer into a main hall where Frontenac and an impressive retinue received him. An angry Frontenac rebuffed the English ultimatum, vowing that his cannon would bear his response.

French defiance presented a dilemma for the English. Colonial leaders had assumed the fleet's mere presence would lead to capitulation. Phips and his officers then quickly improvised a plan to land forces east of Quebec and march overland to attack the city's

weak western defenses. Meanwhile, a small diversionary force would attack from the St. Lawrence.

On October 18, Major John Walley and 1,200 New Englanders landed along Beauport Flats on the St. Lawrence River's north shore. They encountered little resistance, but illnesses, especially smallpox, kept the remaining troops on the transports. The only major obstacle, the St. Charles River, was fordable only for a few afternoon hours during low tide. Rather than attack the English across the river, Frontenac massed troops on the western shore. He planned to allow the English to cross the river, and when the tides rose cutting off reinforcements and retreat he would strike.

Four ships were to support the river crossing, but at dawn on October 19, Phips's vessels dueled with French batteries instead. The exchange accomplished little except to expend most of the ships' ammunition. Boats that were supposed to assist the crossing never arrived.

When a French deserter reported that the English were significantly outnumbered, Walley reassessed his situation. His men were exhausted, sick, frostbitten, and out of provisions. On October 20, Walley requested that his force be withdrawn. That night, as boats arrived to evacuate the provincials, panicked soldiers mobbed them and prevented an orderly withdrawal. Walley's men would have to remain until the following evening.

After skirmishes on October 20 and 21, the English withdrew, leaving behind five of their six cannon. Unaware at first of the New Englanders' flight, Frontenac missed a potential opportunity to destroy the provincial force. Nevertheless, his defensive strategy had succeeded, with minimal French losses.

Phips and his officers debated another landing, but a storm scattered the fleet. Facing serious food and ammunition shortages, smallpox, and the coming winter, Phips negotiated a prisoner exchange. On October 25, he sailed for home. Both sides had suffered about 30 casualties. But a series of shipwrecks and disease pushed the English casualty total to well over 400, not including the smallpox outbreak triggered by the fleet's return. Even worse, the venture was a financial disaster because the colonies planned to recoup the over £50,000 investment through the looting of Quebec. With little effort, the French had repulsed the poorly planned, indifferently led English expedition. The failure soured many colonial leaders on future ventures that lacked significant support from the Crown.

Quebec, Attack on

Start Date: June 25, 1711 End Date: August 23, 1711

Abortive English campaign during Queen Anne's War (1702–1713) that took place during the summer of 1711. The plan called for a seaborne assault on Quebec and a simultaneous, diversionary attack by colonial forces from Albany against Montreal. Frustrated by the lack of Crown support for a failed 1709 attack on Canada, however, colonial leaders doubted reports that a new British expedition, led by Admiral Sir Hovenden Walker, would join provincial forces in Boston for the seaborne operation. The colonial governments cautiously made preparations, nonetheless.

Walker arrived from Britain on June 25, 1711. His force included a dozen warships and numerous transports. They carried seven regiments of regulars and a marine battalion. Brigadier General John Hill commanded the land force that numbered more than 4,000 men. This impressive force, bolstered by thousands of provincials, held great promise, but neither Walker nor Hill proved up to the task.

Walker faced numerous problems. French agents sowed distrust among colonists with rumors that his ultimate purpose was to reassert centralized royal authority. To confuse enemy agents as to the fleet's destination, the Admiralty outfitted Walker's ships with only limited provisions, making colonial support crucial. Unfortunately, Boston already faced a food shortage and had difficulty feeding its populace.

Provisioning several thousand soldiers and sailors seemed out of the question. As a result, profiteering was rife. Lacking adequate specie, Walker's agents tried to negotiate credit, but New England merchants refused or demanded exorbitant interest rates. This crisis forced Gov. Joseph Dudley of Massachusetts to intervene. Boston also became a haven for more than 200 British deserters hidden by sympathetic Bostonians. Lacking an understanding of colonial society or sensibilities, Walker saw only intransigence.

For all these difficulties, Walker departed Boston on July 30, 1711, with 9 warships, 2 bomb ketches, and more than 60 transport and supply vessels. Despite commanding more than 12,000 soldiers and sailors—the largest armed force ever seen in the colonies—Walker had serious doubts about the prospects for success. He feared the coming winter, unpredictable weather, and supply shortages that had doomed the New Englanders' 1690 campaign. With only three months' food supplies, Walker could not support a lengthy siege and he feared being trapped by winter ice. His force would also have to navigate without adequate charts or pilots some 400 miles up the St. Lawrence, a river known for fog, dangerous shoals, winds, and currents.

Tragedy struck the expeditionary force on the night of August 23 as the fleet neared Île-aux-Oeufs, some 100 miles from Quebec. Off course and blinded by fog, the ships blundered toward the north shore. Seven transports and a supply vessel foundered, leaving nearly 900 men dead.

Following two days of salvage efforts, and even though he still possessed a sizable force, Walker's spirit was broken. He persuaded a council of war to abandon the operation. When the fleet rendezvoused at Cape Breton Island, near the mouth of the St. Lawrence, both Walker and Hill rejected suggestions of a more limited operation against Placentia, Newfoundland. While Walker's force returned to England, the provincials sailed for Boston. Without Walker's attack, the campaign crumbled.

Critics on both sides of the Atlantic sought scapegoats. Walker and Hill blamed colonial obstructionists, claiming New Englanders had sabotaged the campaign to preserve the lucrative wartime trade with New France. Colonial leaders countered that they had raised the necessary forces under difficult circumstances and faulted Walker's inept leadership. Whatever the cause, the failed expedition reinforced the poor relationship between the New England colonies and the Crown.

Quebec, Battle of

Event Date: September 13, 1759

Decisive battle of the French and Indian War (1754–1763). Fought on September 13, 1759, the Battle of Quebec was the most important military engagement in the century-and-a-half struggle between Britain and France for control of North America east of the Mississippi River. Indeed, it was probably the most important battle in the history of colonial North America.

The French stronghold of Quebec was the capital of New France and a long-standing primary British military objective. Situated on a peninsula towering above the northern bank of the St. Lawrence at a point where the river narrows, Quebec was known as the

"Gibraltar of the Americas" for its natural as much as manmade defenses. High cliffs made bombardment from below almost impossible and a direct amphibious assault suicidal. Subsidiary rivers blocked attacks on either flank, and a landward approach faced strong walls and would be, in any case, possible only if supporting ships moved upriver and ran a gauntlet of gun batteries.

If Montreal to the southwest, farther up the St. Lawrence, remained secure, Quebec could be supplied indefinitely by water. Siege operations were also complicated by the tides and treacherous currents of the St. Lawrence, and winter made the river impassable with ice.

In spite of these obstacles, British prime minister William Pitt recognized that taking Quebec was the key to the defeat of New France. In 1758 British forces seized the fortress of Louisbourg on Cape Breton Island that guarded the mouth of the St. Lawrence, and Pitt approved plans for a strike led by Brigadier General James Wolfe, who held a local commission as a major general. Wolfe, the youngest officer to hold that rank in the army, had distinguished himself in the attack on Louisbourg, and he sailed from England with the naval commander, Vice Admiral Sir Charles Saunders, in February 1759. In all, the force earmarked for opera-

tions against Quebec included 49 warships, 119 transports, and 9,000 troops.

The British force moved up the St. Lawrence toward Quebec to face some 12,000 French forces assisted by local militia and some Native Americans, all under the command of Lieutenant General Louis-Joseph, Marquis de Montcalm. Wolfe established a base near Quebec on the Île d'Orléans on June 26, 1759. The French dispatched fire ships in a failed attempt to burn the British ships the following night. Meanwhile, the British sent gunners ashore at Point Lévis, directly across the St. Lawrence from Quebec itself. Those gunners established a battery of six 32-pounder cannon and five 13-inch mortars that opened fire on July 12 and battered the city for the next seven weeks.

Wolfe landed troops north of Quebec at Beaupre on July 9 and assaulted Beauport on July 31. Both attacks failed to provide a clear avenue of advance, and they left Wolfe deeply frustrated. All efforts to draw the defenders out of the fortress proved futile. Throughout August, Wolfe struggled to approach Quebec without success, while his naval officers endeavored to chart the difficult estuary around the city. The stress of command left Wolfe bedridden with kidney stones and rheumatism. Many of his men thought he was dying.

British troops prepare to fight the French near Quebec on the Plains of Abraham, September 13, 1759. (North Wind Picture Archives)

Wolfe's spirits improved only slightly when Vice Admiral Saunders slipped some ships past Quebec in July and August and began landing light infantry upriver to destroy French farms and supplies. Montcalm reacted by detaching his aide-de-camp, Louis-Antoine de Bougainville, and 3,000 men to patrol the cliffs south of the city. Then Wolfe saw an opening. On September 3, he quickly moved his headquarters and most of his men to the south shore beyond Quebec. He personally scouted a landing place at L'Anse du Foulon, only two miles from the city, and sent British naval units upriver and then ordered them to drift back with the tide to test Bougainville's reaction.

The French shadowed the fleet each time, but slowed as they grew tired and suspected the movement was a ruse. Wolfe also mounted feint assaults to keep the French off balance. On September 10, he learned from deserters that Quebec was short on food, that Montcalm feared the British would interdict supplies coming from Montreal, and that no landing was expected near the city. Time was running out for Wolfe, however. With winter only a few weeks away, Saunders feared his ships would be trapped in winter ice and threatened to depart with them.

Wolfe sent his ships up and down the river again and again to pull Bougainville away from Quebec and tire his men. Taking advantage of intelligence provided by Captain Robert Stobo, a British captain who had been held prisoner in Quebec and knew the city well, Wolfe then ordered an assault just north of the city at 4:00 a.m. on September 13 at Anse du Foulon, where a narrow footpath angled up the steep cliffs.

In a lucky stroke, Wolfe learned from more deserters that this was the same night the French expected to be resupplied by boats from Montreal, giving the British a perfect cover for their landing. He sent Saunders to bombard and launch a feint attack on Beauport, then took 4,800 men upriver and drifted back in the darkness. Bougainville did not follow closely. At 2:00 a.m. on September 13, Wolfe led his men in boats across the St. Lawrence. They landed two hours later, scrambled 180 feet up the narrow path to the top of the cliffs, overwhelmed the French sentries there, and captured a nearby French camp.

By 6:00 a.m. the British had approximately 4,500 men deployed in line of battle on the Plains of Abraham above the city. The next move belonged to Montcalm. The French commander discounted reports that the British had successfully landed. Nevertheless, he dutifully rode out with Governor-General Philippe de Rigaud de Vaudreuil to see for himself. He was astonished when he found Wolfe's men and immediately decided to attack. This decision provided endless fodder for historians. Indeed, Montcalm

advanced without waiting for Bougainville, without most of his provincial troops or militia, without Quebec's garrison, and with only three artillery pieces. Moreover, with winter approaching, Montcalm had excellent reason to play for time. His defenders have argued that Quebec was short of supplies, that artillery above the city could command the lower town, and that the French had to strike before Wolfe was reinforced. But the decision to offer battle outside the city while outnumbered seems so impulsive it may have had more to do with emotion than anything else.

Whatever Montcalm's motive, the battle of less than half an hour that followed featured no cavalry and very little artillery. It was purely an 18th-century black powder infantry duel, in which British discipline carried the day. Both sides deployed across the Grande Allée, the main road leading toward Quebec's St. Louis bastion. Six British battalions faced five regiments of French regulars in the center on a tabletop battlefield whose sloping sides prevented maneuver. Wolfe had one battalion in a second line, a battalion on each flank, and one in reserve. In contrast, the outnumbered Montcalm placed marines, militiamen, and Native Americans on his flanks and had no second line or reserves of any kind.

The battle began with sniping and skirmishing on the flanks. At 8:00 a.m. Montcalm's artillery opened up with grape shot. Wolfe ordered his men to lie down to protect themselves, until 10:00 a.m. when the French infantry came on at a run. Their hasty advance opened gaps in their lines, and when some units fired early and began to reload much of their cohesion was lost.

Wolfe had ordered his men to load an extra ball in their muskets and wait until the French were at close range. As they neared his position he ordered them to stand and fire. Legend has it the British unleashed only one volley, which is almost certainly not true. Some redcoat battalions probably fired as the French closed, but at some point there was one great final volley that sent Montcalm and his men into headlong retreat. French losses were reported as 644 killed and wounded, compared to 658 for the British. Yet the psychological shock for the French was total. Wolfe, already wounded at least once, was mortally struck as the French broke and ran. Wolfe died quickly. Death also claimed Montcalm, who was hit by British grapeshot during the retreat and lingered a day before dying.

Surviving French forces under Vaudreuil ran all the way to Beauport, then turned and fled toward Montreal, picking up Bougainville and his men along the way. Quebec surrendered on September 18, and remained in British hands thereafter. French efforts to resupply their forces in Canada were stymied by a British victory in the naval Battle of Quiberon Bay on November 20. The French did mount an offensive to retake Quebec in April 1760 and defeated British forces under Brigadier General James Murray on the Plains of Abraham after the British commander impulsively gave battle much as Montcalm had done. But the British fell back into the city and withstood the ensuing siege. Montreal succumbed to the British in 1760 and, when the French and Indian War ended in 1763, France relinquished Canada for good.

Quebec, French Attempt to Recapture

Start Date: April 27, 1760 End Date: September 8, 1760

French counterattack on Quebec during the French and Indian War (1754–1763) in the spring of 1760, also called the Battle of Sainte Foy and Second Battle of Quebec. The French expedition followed Major General Louis-Joseph, Marquis de Montcalm's, infamous loss to Brigadier General James Wolfe's British forces the previous autumn.

The September 13, 1759, engagement between British and French forces on the Plains of Abraham at Quebec is often portrayed as the decisive encounter of the French and Indian War. However, this was by no means apparent at the time. Wolfe's decision to attempt a landing directly in front of the heights, rather than on the road to Montreal farther west, indeed had led to Quebec's capitulation on September 18. But it also allowed the French Army to escape upriver and live to fight another day.

Before the month was out, more than 7,000 French regulars, Canadian militiamen, and native warriors had been gathered at Montreal under Montcalm's replacement, Major General François-Gaston de Lévis. Ships had also been dispatched to France requesting thousands more troops for a spring counteroffensive. Combined with the October 26 departure of the bulk of the Royal Navy from Canada because of the impending freeze of the St. Lawrence River, the end of the year saw the military advantage swing decidedly to the French.

Following their victory, the British had left a sizable garrison of 7,300 men at Quebec under a junior brigadier, James Murray, who replaced the deceased Wolfe. However, this number was quickly halved by hunger, scurvy, and unusually bitter weather. Had the French decided to attack during the winter of 1759–1760, not only

could they have snowshoed over Quebec's perimeter walls, but they would have faced a starved and disease-ravaged British force.

As it worked out, the earlier ice-out near Montreal enabled Lévis to mobilize his forces by mid-April. The French flotilla essentially moved with the melt in the St. Lawrence from Montreal toward Quebec. By comparison, the few British ships left at Quebec were still encased in 14 feet of ice as of April 9. This fact significantly compromised Murray's intelligence-gathering ability as well as his military readiness.

On the morning of April 24, Lévis's men landed and began moving inland. By the evening of April 27, they were skirmishing with the British outside the parish church at Sainte Foy, about five miles to the west of Quebec. The next day Murray marched out of the fortified town center leading those still fit to bear arms. This force, numbering about 3,800 men, charged the French lines. Murray's forces initially drove the French back, but the core of Lévis's troops, until now hidden in the nearby woods, came up on both flanks and began to surround the British. Murray then ordered artillery brought up. But the muddy, snowy ground and the fact that the gun carriages were of necessity propelled not by horses but by the walking wounded caused the guns to bog down long before reaching the front lines. With the French encirclement nearly complete, Murray ordered a retreat that quickly devolved into a panicky flight and saw the British leave behind a large number of muskets, cannon, and entrenching tools. Having essentially fought the 1759 battle of Wolfe and Montcalm in reverse, Lévis continued to follow the script by laying siege to Quebec.

The Battle of Sainte Foy now rested on whether a British or French ship would be the first to navigate the St. Lawrence with supplies and troops. On the morning of May 9, 1760, both Lévis and Murray strained to discern the colors of the season's first vessel to draw within sight of Quebec. Much to the relief of the British, it was the Royal Navy ship *Lowestoft*, which brought word that the British had reinstated their naval blockade of New France.

Soon British ships moved upriver to bombard Lévis's position on the heights. Meanwhile, those remaining downstream destroyed the French reinforcement fleet in Restigouche Bay. Lévis could only fall back to Montreal, where three British armies advancing from the south, west, and east surrounded his forces and secured their surrender on September 8. Although peace would not officially arrive until the Treaty of Paris was signed in 1763, the Battle of Sainte Foy and its aftermath signaled the end of more than 150 years of French imperial presence in Canada.

Queen Anne's War, Land Campaigns

Start Date: May 1702 End Date: April 1713

A series of engagements fought in North America and tied to the greater European conflict known as the War of Spanish Succession (1702–1713). Charles II, the Habsburg king of Spain (1661–1700), was childless. On the urging of King Louis XIV, French diplomats worked to secure the inheritance for Louis's grandson, Philippe d'Anjou. The French were successful, and on his death in November 1700, Charles left his considerable European and overseas possessions to Philippe on the condition that they not be divided. European leaders had long dreaded the Spanish succession and there were discussions of possible partition plans (along the lines of the eventual settlement in 1713). A diplomatic solution would have averted a long and costly war, but Louis rejected any such arrangement.

France united with Spain and its possessions would be a formidable power bloc. To prevent this, the threatened powers put together a coalition, and fighting began in March 1701. The war has sometimes been called the first world war, for the fighting took place around the globe, in Europe, India, and North America. England became a leading player in the coalition to stymie French ambitions, allying itself with Austria, the Netherlands, Prussia, and most of the other German states against France, Spain, and Bavaria. In May 1702, England formally declared war and John Churchill, Earl of Marlborough, arrived in Holland as captain general of English and Dutch forces.

In North America, the war became the second of four conflicts fought for control of the continent. The English colonists there knew it as "Queen Anne's War," for the English ruler, Queen Anne (1702–1714). They saw the war as an opportunity to break the ring of French and Spanish settlements extending in a great arc from Canada (New France) to the Gulf of Mexico.

The first fighting in the New World occurred in 1702, when the English moved against French and Spanish holdings in the Caribbean. English forces moved from their possessions in the Leeward Islands to occupy the French portion of the island of Saint Kitts. This early success led to the unsuccessful siege of French Guadeloupe in the spring of 1703.

British North American colonists viewed the war as an opportunity to raid and plunder French and Spanish colonial holdings. South Carolina raised a force of militia and native warriors, Under

A treaty between the "Eastern Tribes" of North America and the British following Queen Anne's War (1702–1713). In it, the representatives of the tribes agree to "forbear all acts of Hostility towards all the Subjects of the Crown of Great Britain." (Library of Congress)

the command of Gov. James Moore Jr., this force raided southward against Spanish Florida in October 1702. Moore destroyed several outposts along the St. Johns River, and then moved on St. Augustine. The Spanish abandoned the town and withdrew to the Castillo de San Marcos. Moore's forces burned the town and returned to their ships on the approach of Spanish warships. Moore mounted another expedition to strike at the Spanish outposts in western Florida. Moore used the promise of plunder to enlist native allies to participate in attacks against Spanish missions. This expedition proved a success, with all but one of the 14 missions taken, and nearly 1,000 mission natives taken as slaves. The Carolinians were unable to push through the Choctaws, however, to get at the French gulf settlements.

In June 1703, the French colonial government enlisted the help of the Abenaki Native Americans for a series of raids along the northern frontier of New England. The purpose of the attacks was to prevent the expansion of the British colonists into the interior near New France. With French assistance and leadership, nearly 500 warriors

swept into the English settlements in Maine (then part of Massachusetts). Towns such as Wells and Saco were destroyed, and a number of their inhabitants either killed or carried off into captivity.

During these attacks, the New England colonies were left to their own devices to protect their settlements. Britain was heavily committed in fighting on the European continent, and the New York colony had made a separate peace with the natives and was not subject to native raids. The New England colonies therefore continued to suffer severe losses, amid increasing rumors regarding New Yorkers' trade with the local natives.

During the night of February 29, 1704, a force numbering 48 Frenchmen and Canadians and 200–250 native allies attacked Deerfield, Massachusetts. They were able to achieve complete surprise. The raid resulted in the death of 50 English colonists and the capture of 112 more. Twenty-one of the captives died during the 300-mile trek back to Montreal. Eventually, the survivors were ransomed and returned to Deerfield.

In response to the numerous French and native raids on New England, Massachusetts raised troops to carry the war to the French in the spring of 1704. In June of that year, Colonel Benjamin Church led a force of 500 New Englanders north to destroy the Abenaki supplies and to control the Acadian fisheries. They destroyed Abenaki villages at Minas and Beaubassin in July, then besieged the French Acadian fortress of Port Royal. Unable to take it, they then voted to return home. In Newfoundland, a force of French and Native Americans mounted a raid from Placentia against an English settlement at Bonavista during August 18–29, 1704.

In 1705, there was a lull in the fighting in North America, and the French governor proposed a prisoner exchange with the New England colonies. Both sides had taken large numbers of captives over the previous two years in raids along the frontier, but the negotiations yielded only a small number of exchanges. The governments of New France and Massachusetts actually considered a separate peace, but the negotiations failed.

In 1706, a commissioner from Massachusetts, Samuel Vetch, sailed for Britain to obtain military assistance from the Board of Trade to settle the conflict. That same year, the French and the Spanish combined their forces to strike at the British in the American South and in the Caribbean. A combined force of Spanish troops and French privateers sailed from Havana, Cuba, and St. Augustine, Florida, to raid Charles Town (present-day Charleston), South Carolina. The South Carolinians were able to defeat the poorly led landing force and then raised a naval force to defeat the French ships.

South Carolina then attempted to enlist native allies to attack Spanish holdings around Pensacola and Mobile. An attack was mounted on Pensacola in 1707, but it was not successful.

New England again attempted to mount an attack against the seat of the French colonial government in Acadia by attacking Port Royal in the spring and summer of 1707. Colonel John March led a force of roughly 1,500 men funded by the government of Massachusetts. The forces landed and drove the French back into their defensive works. A lack of discipline and poor colonial leadership,

Name in North America	Name in Europe	Dates in North America	Dates in Europe	Treaty Ending Hostilities

however, enabled the French to reinforce the garrison. By August the attempt to take Port Royal had failed and the troops returned to Massachusetts.

In summer 1708, the French took the initiative by launching another series of raids along the New England frontier. A large force of 400 French Canadians and their native allies set out, but a growing number of the Native Americans left the expedition. On August 29, 1708, the now-reduced force attempted to strike at Haverhill, Massachusetts. The raiders faced a spirited defense and were forced to withdraw on the arrival of Massachusetts reinforcements. The French did succeed in capturing St. Johns on December 21, 1704, bringing all the eastern shore of Newfoundland under their control.

Throughout 1706–1709, colonial representatives worked to obtain military assistance from the Board of Trade in Britain. In 1709, Queen Anne granted approval for a military force to be sent to New England, which would move in concert with a colonial military force commanded by Colonel Francis Nicholson. Provincial troops gathered in Albany, New York, in preparation for an advance on Montreal to assist the planned British advance on Quebec and Port Royal. In October, however, word was received that continental demands had led the British to cancel their participation and send the forces to Portugal instead, whereupon the entire operation was called off. The colonial representatives then dispatched another team of delegates to plead their case before the Board of Trade.

Representatives of Massachusetts, New Hampshire, Connecticut, and Rhode Island petitioned Queen Anne for a new British military operation against the French in 1710. The representatives also voted to assemble their own expedition to take Port Royal as soon as possible. Toward that end, in September 1710, a colonial force of 3,500 men under the command of Nicholson sailed from Boston for Port Royal. This time the British supplied a naval force of 36 vessels, including a bomb ketch. Captain George Martin had command. The British also contributed a regiment of Royal Marines. The siege of Port Royal opened on September 24, 1710, and the badly outnumbered French surrendered the citadel on October 1. Port Royal became Annapolis Royal.

In 1711, the British government approved plans to send a military force to New England for an invasion of New France. The colonial representatives agreed to raise provincial troops to assist in this invasion. The British force of more than 60 ships and 5,000 men arrived in June 1711. A fractured British command structure prevented any rapid movement northward, however. By August 1711, the force sailed for the St. Lawrence River. At the mouth of the St. Lawrence, an incompetent pilot led some of the British ships onto the rocks, with the loss

of 8 transports. More than 700 soldiers and 200 sailors were lost. British admiral Sir Hovenden Walker abandoned the operation, and returned with his remaining ships to England. With the loss of British military assistance, the colonial forces again disbanded.

A new Tory government in London opened negotiations for peace with the French in December 1711, and in April 1713, the warring parties agreed to peace in the Treaty of Utrecht. Philippe, Duc d'Anjou, became King Philip V of Spain, with the proviso that the French and Spanish Crowns could never be united in one person. Spain was also forced to cede territory in Europe to the Austrian Habsburgs. In the New World, the English received recognition of their claim to Hudson's Bay, and received control of both Acadia and Newfoundland. The French retained both Cape Breton Island and the islands of the St. Lawrence. The French then moved to build an even stronger fortification than Port Royal. Located on Cape Breton Island, it was later known as Louisbourg.

Although many New England colonists were unhappy with the settlement, it considerably advanced British fishing, fur-trading, and commercial interests in North America, and it opened up new lands for British settlement. The failure to define the frontiers precisely led to renewed conflict, however. In 1744, the English and French colonists in North America were again at war.

Queen Anne's War, Naval Campaigns

Start Date: 1702 End Date: April 1713

During Queen Anne's War (1702–1713, known in Europe as the War of the Spanish Succession), England for the second time fought France for control of North America. In the naval sphere, the combatants devoted most of their strength to the larger contest in Europe. For Great Britain and the other powers of the Grand Alliance fighting France and Spain, the New World was decidedly a secondary theater. Moreover, European strategists saw the West Indies as far more important than the colonies in North America. Consequently, duty in European waters received first claim on naval resources, securing the West Indies trade had second claim, and operations in the North Atlantic and North America were a distant third.

When the war began, the Royal Navy and the Dutch Navy outnumbered the combined French and Spanish fleets by roughly two to one. The Royal Navy alone possessed 206 ships, ranging from powerful first rates carrying 100 guns or more and displacing almost 2,000 tons to 8-gun yachts displacing less than 100 tons. About half of all vessels mounted at least 50 guns and were considered fit to participate in the line of battle that characterized fleet actions of the period.

A sizable expedition of 30 British and 20 Dutch warships under Admiral Sir George Rooke failed to take Cádiz, Spain, in 1702, but then seized the Spanish treasure fleet at Vigo Bay in October. The Royal Navy dominated the war in the Mediterranean. Rather than conduct massed fleet actions against the more powerful English and Dutch navies, France pursued a commerce-raiding strategy in an effort to disrupt the vital English and Dutch oceangoing trade. French privateers operating from Martinique preyed on the colonial trade with the West Indies. In response to privateering in the Caribbean and off the North American coast, the majority of English naval vessels assigned to the North American station spent the war protecting trading convoys. Ships of the Royal Navy also escorted troop convoys across the Atlantic. From bases in Newfoundland, Boston, New York, and Virginia, ships also performed coast defense duties for the colonies and supported a limited number of amphibious raids on French territory.

In America, colonial forces struck both French and Spanish targets by sea and by land. In 1702, Gov. James Moore of South Carolina

mounted an amphibious attack against the Spanish at St. Augustine, Florida. After an eight-week siege, the arrival of two Spanish warships caused Moore's force of 50 colonists and 1,500 Yamasee warriors to withdraw. The Spanish vessels cornered Moore's fleet, forcing him to order his ships burned and retreat overland. Moore followed his expensive failure at St. Augustine with a privately financed campaign against the Spanish missions and American Indians of the Gulf Coast. This devastating campaign served to unite the French and Spanish colonists. They collaborated in a 1706 action in which French privateers carried Spanish troops from Cuba and Florida to attack Charles Town (present-day Charleston, South Carolina). Carolina colonel William Rhett assembled a squadron of ships and repulsed the Franco-Spanish attack, capturing a ship and hundreds of prisoners in the process.

In New England, meanwhile, after an especially bloody French-Abenaki raid on Deerfield, Massachusetts, the colonial government authorized Colonel Benjamin Church to organize a naval expedition against Port Royal, Acadia. Church and some 550 men set sail from Boston on May 11, 1704. They burned villages along the coast and took some 100 prisoners but failed to capture Port Royal. Three years later, more than 1,500 inexperienced New England militiamen and seamen led by Colonel John March again sailed for Port Royal. The May 1707 expedition also ended in failure when the officers and men fell into squabbling and insubordination.

As French and native raids continued to terrorize the frontier, Gov. Joseph Dudley of Massachusetts dispatched a delegate, Samuel Vetch, to London to request military assistance. In 1709, Vetch returned with a promise of five regiments and naval support for an attack on Canada. Vetch raised three colonial regiments under command of Colonel Francis Nicholson. The colonials then waited months for the British to arrive. They finally learned in October that the ships, under command of Rear Admiral John Baker, had—in May—been sent to deal with a European emergency instead. New Englanders talked of attacking Canada with the British ships already stationed in American ports, but the ships' captains refused to cooperate. Nicholson sailed to London to make another appeal and secured yet another promise of marines and ships, which finally reached America in July 1710.

The joint New England–British expedition finally attacked Port Royal on September 25, 1710. A British flotilla comprising three 50s, two frigates, and a bomb vessel provided fire support for Nicholson's 3,500 provincials and a regiment of British marines. On October 2, the French garrison surrendered Port Royal and the surrounding area. Nicholson renamed the post Annapolis Royal in honor of the queen and returned to London to secure the promise of additional support for an attack on Quebec. The capture of Port Royal proved the only enduring naval success of Queen Anne's War.

In June 1711, some 70 British naval vessels arrived in Boston under the command of Admiral Sir Hovenden Walker and accompanied by the inexperienced General John Hill in command of 5,000 British regulars. A force of about 12,000 men, including New England militiamen and British regulars, marines, and sailors,

embarked for Canada on July 30, 1711. Some three weeks later, befuddled by darkness, fog, and wind in the St. Lawrence, Walker relied on a captured French pilot for guidance. Eight transports and two other ships ran aground, drowning more than 900 men. Walker and Hill hastily abandoned the mission and returned to England, leaving the New Englanders no choice but to return home. In disgust Nicholson disbanded his troops, who had been waiting near Lake Champlain for orders to march on Montreal. The war ended in 1713 in the Treaty of Utrecht without further major action.

R

Raiding Party

A customary warfare tactic employed by Native Americans. The raiding party, often referred to as a war party, was the basic American Indian tactical military unit. Raiding parties figured prominently both in clashes among various native groups and in native conflict with Europeans. Raiding parties varied greatly in size. Membership was voluntary, and the leadership was generally based on merit. Raiding parties numbered as few as 5 or 6 warriors and as many as 100.

Typically, a raiding party consisted of tribal members who chose to follow a particular individual bent on going to war. There were several ways an individual might do this, including a warrior striking the war post with a war club or tomahawk or placing his weapons at a prominent space in the village, facing in the direction of the enemy. If the call for war went out to a number of tribes, war belts transmitted the appropriate message.

The leader of the raiding party was sometimes referred to as a war chief, although not all raiding parties required the leadership of such a prominent figure. Once the party assembled, it traveled with as much stealth as possible, moving only at night, and avoiding the use of fires in camp. The warriors marched single file to avoid disclosing their numbers, and the last men in line would try to cover the tracks of the group.

Once in the vicinity of its objective, the raiding party usually chose to attack at dawn, hoping thereby to achieve surprise. The goal was to kill enemy warriors and take their scalps. Women and children were taken captive and sometimes adopted in accordance with the practice of the Mourning War. Another common tactic of the raiding party was to lay in wait and ambush an enemy in what was known as the "skulking way of war."

The European colonists quickly adopted many of the tactics used by raiding parties, and employed them against Native Americans. The colonists also came to rely on ambushes and surprise attacks against native villages. Although both the British and the French colonists adopted native tactics, the French seemed especially adept at this style of warfare. As time progressed, some raiding parties consisted of both natives and Europeans. English colonist Robert Rogers was one of the most successful practitioners of this type of warfare. A daring and resourceful leader in the field, he excelled in raiding and ambushes.

Râle, Sébastien

Born: January 4, 1657 Died: August 23, 1724

French Jesuit priest, missionary, and agent among the Abenakis. Sébastien Râle was born on January 4, 1657, at Pontarlier, France. Râle arrived in New France in October 1689 and was sent to minister

Woodcut of a Native American raiding party preparing to attack a homestead. (North Wind Picture Archives)

to the Abenakis, first in Quebec and then in Acadia. In 1694, he established the mission at Norridgewock on the Kennebec River in present-day Maine, then part of Acadia. There he would spend most of the rest of his life. During Queen Anne's War (1702–1713), the Abenakis sided with France and fought alongside Canadian and French soldiers in a series of raids on the New England frontier. New Englanders blamed Râle for stirring up the Abenakis and, during the winter of 1705, they mounted an expedition against his mission. Although the troops failed to capture the priest, they burned his church. For the next five years, Râle was engaged in ministering to Abenaki refugees at a new mission at Beçancour in Quebec.

Although Râle was able to return to Norridgewock in 1710, he soon found himself in a new and more vulnerable situation. When the Treaty of Utrecht was signed in 1713, ending Queen Anne's War, the part of Acadia where his mission was located was ceded to England and became part of the Massachusetts Bay Colony. The English undertook to rebuild Râle's church for use by a Protestant missionary, but this effort failed. Still, in 1720, a Rev. Joseph Baxter arrived on the Kennebec River to proselytize among the Abenakis, which led to acrimonious exchanges with his Catholic counterpart. More ominous was the arrival in the area of large numbers of English settlers and the growth of trade in English goods with the Abenakis. When forts to protect the settlers and traders

began to go up, Râle informed his superiors in Canada that he soon would be forced to leave his post.

Matters came to a head in 1721, when Râle led a movement among the Abenakis to resist English encroachments on their lands. Mobilizing members of the tribe in Canada to support their brethren in Maine, he appears to have authored a petition to Gov. Samuel Shute of Massachusetts, demanding the withdrawal of English settlers from Abenaki lands. The British authorities now called on the French government to remove Râle and, when this failed, 100 New England soldiers surrounded the mission in January 1722. When Râle again managed to elude capture, the soldiers pillaged his home and church. The attack on Norridgewock led to Abenaki reprisals, and in July 1722, Massachusetts declared war on the Abenakis, resulting in what is known as Dummer's War.

On August 23, 1724, a New England force of 200 men under the command of Johnson Harmon and Jeremiah Moulton descended on Norridgewock. In the ensuing attack, Râle was killed. He was scalped so that proof of his death could be offered, thus allowing those who had killed him to collect a £100 reward.

Raleigh, Sir Walter

Born: ca. 1552

Died: October 29, 1618

English soldier, explorer, and writer. Born about 1552 in Devonshire, Walter Raleigh (also spelled Ralegh) was a fervent Protestant from his youth. Believing that Catholicism on the European continent presented a mortal threat to English Protestantism, in 1569 he joined French Huguenot forces fighting against Catholics in France. By 1572 he had returned to England, where he attended Oriel College at Oxford before studying law in London.

Influenced by his half brother, Sir Humphrey Gilbert, Raleigh became interested in American colonization. Raleigh saw the great wealth and power that Catholic Spain had derived from its American empire and believed that an English empire in the New World would provide the resources that could allow England to withstand the threat from its political and religious rival. In 1578, Raleigh accompanied Gilbert on the latter's ill-fated attempt to explore North America.

After his return to England, Raleigh resumed his military service in 1580 as a captain in the Irish garrison. His services came to the attention of Queen Elizabeth I, and Raleigh attached himself to her court, soon becoming one of Elizabeth's favorites. The queen granted him an estate at Durham House for his services; there, Raleigh assembled others interested in colonization to plan ventures in North America.

From Simon Fernandes, a Portuguese seafarer who had served for the Spanish in America, Raleigh learned of the existence of Chesapeake Bay. Deciding that the bay would provide an ideal location for an English colony, Raleigh set about preparing an expedition. He believed that a Chesapeake colony would be fairly secure from Spanish attack and provide a convenient base for raids against Spain's American treasure fleets. Aware of how Spanish cruelty had alienated the Native Americans, Raleigh advocated a policy of fairness that would make the North American natives allies of England. He hoped that their assistance would help defend the colony from the Spaniards, and believed that an English-native alliance might eventually oust the Spanish from some of their holdings.

Elizabeth approved Raleigh's plans and in 1584 granted him a patent to the lands he intended to colonize in North America. He dispatched an expedition that year, which reached the coast of present-day North Carolina. The queen knighted Raleigh for this success, and the following year he sent a larger expedition that did not find Chesapeake Bay but established a colony at Roanoke on the barrier islands of North Carolina. However, the settlers abandoned the colony in 1586 because of a shortage of provisions.

Contemporary print showing Sir Walter Raleigh ordering the standard of Queen Elizabeth I erected on the Virginia coastline in 1585. (Library of Congress)

Raleigh mounted another attempt in 1587. A second group of settlers arrived at Roanoke. However, Raleigh was unable to send further expeditions until 1590 because he was involved in efforts to defend England from threatened attack by the Spanish Armada. When Captain John White's expedition finally reached Roanoke, he found the colony inexplicably abandoned and returned to England.

Raleigh's colonization efforts were interrupted when he lost the queen's favor after she discovered that Raleigh had impregnated and secretly married one of her ladies in waiting without her permission. Elizabeth ordered Raleigh imprisoned. After his release, he made a further effort to explore the New World, sailing to South America in 1595 in search of the fabled city of El Dorado. In 1600, Elizabeth appointed him governor of Jersey, a post he held until 1601, when Elizabeth's successor, King James I, came to the throne.

James suspected Raleigh of plotting against him and confined him to the Tower of London. Briefly released, in 1616 Raleigh journeyed once more to South America seeking El Dorado. During the voyage, some of Raleigh's men plundered the Spanish town of San Thome. The Spanish ambassador to England insisted that Raleigh be punished, and shortly after Raleigh's return, James ordered his execution. Raleigh was beheaded on October 29, 1618.

Rangers

Specialized troops that developed in the British North American colonies. The rangers' distinctiveness lay in the fact that their training focused on the emulation of Native American methods of combat. Rangers first developed in the 17th century as specially trained troops whose primary function was to patrol between outposts on the frontier in the English colonies. Very quickly, these troops began to take on an offensive role as well. Several different patterns of service developed regionally in the colonies. Ranger units that developed in New York and New England, however, eventually came to stand as the most commonly recognized. By the time of the French and Indian War (1754–1763), rangers had formed an important auxiliary to British forces in North America, and some British regular army officers even received training in their techniques.

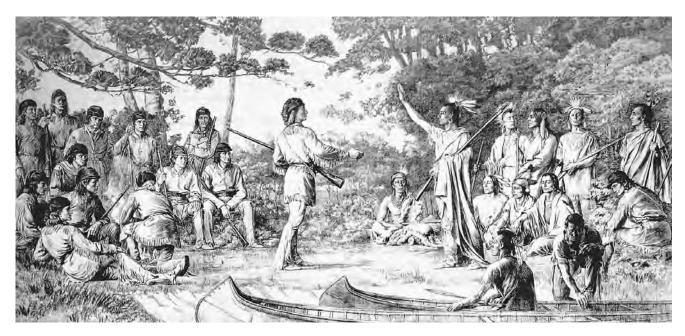

Initially, some colonial militias received training from Native Americans in their fighting methods. These men then served alongside native allies on patrols between frontier outposts. They also raised the alarm when hostile incursions began. These men can be

considered as the forerunners of the rangers. In New York and the New England colonies, rangers were strictly infantry troops. In the southern colonies, however, where a strong tradition of horsemanship had already manifested itself, rangers were mounted.

Generally speaking, the early rangers differed from militias in two main ways. First, they were recruited for longer periods of service and for a bounty. Second, they served across greater distances even while patrolling defensively. By the end of the 17th century, the rangers began to act offensively by initiating raids on Native Americans. A key figure in pushing forward the development of the rangers was Benjamin Church, famed New England frontiersman and soldier. He was particularly enamored with the adoption of Native American war tactics, or the "skulking way of war." Additionally, Church was the first to advocate the concept of using rangers against Europeans as well, specifically the Acadians.

In an offensive capacity, the rangers often employed tactics that were much more akin to those of the Native American raiding party than to those of the European battlefield. The methods the rangers used included the use of concealment, stealth, and ambush. In addition, rangers were known to attack noncombatants, including women and children. They sometimes killed prisoners and scalped enemies as well. They were rewarded with bounties for the latter practice. By the late 17th century, in addition to Native Americans, the rangers' adversaries included the French troupes de la marine (provincial regulars) and Canadian militia.

In the 18th century, the English colonists relied less on mixed units of settlers and Native Americans, and the composition of the ranger units became more homogeneous. Rangers reached their peak of activity in the French and Indian War. Robert Rogers led the most famous unit of ranger troops to see service in this conflict.

Meeting between Native Americans led by Ottawa chief Pontiac and Rogers' Rangers. Established during the French and Indian War, the rangers were specialized military units practicing Native American techniques of warfare. (Library of Congress)

Although many British commanders who witnessed them disliked the methods practiced by the rangers, they could not debate that their methods achieved results. Some British commanders, therefore, recognized the value of training their men how to survive in the wilds, and sent their junior officers through training with Rogers.

Rappahannocks

A small, Algonquian-speaking Native American group that lived on the Rappahannock Peninsula in the Tidewater area of eastern Virginia. The Rappahannocks' principal village was at Cat Creek Point on the north side of the Rappahannock River. The Rappahannocks had a lifestyle similar to that of other eastern and northeastern woodland American Indians. They lived in small villages built in clearings that contained about 200 people. The men engaged in hunting and fishing, and the women grew corn (maize) and other vegetables. Crops were gathered and stored in hand-woven baskets. The men used flint knapping to create arrowheads for hunting and for war.

In the late spring and summer of 1608, Captain John Smith sailed west from the new English colony at Jamestown to explore, going up the great rivers that empty into Chesapeake Bay. One of these tributaries was the Rappahannock River. Smith explored the Rappahannock roughly 130 miles from Chesapeake Bay to the fall line. On his journey, Smith was entertained by a group of friendly natives called the Moraughtacunds. They advised him not to go to the Toppahanocks (Rappahannocks), who were deemed a dangerous people. Furthermore, they claimed that the Rappahannocks would kill the Moraughtacunds if they discovered that they had helped Smith. Smith ignored the Moraughtacunds' warnings, and he sailed to a place where some Rappahannocks were located. The encounter turned violent. Smith recorded that one of the Rappahannocks was killed and one colonist was shot with an arrow.

The Rappahannocks were at the time a member of the Powhatan Confederacy, put together by Chief Powhatan. He had inherited dominion over 6 native peoples—the Arrohattocs, the Appomattocs, the Mattaponis, the Pamunkeys, the Powhatans, and the Youghtanunds. He had then by various means added 25 more tribes to the confederation. Each of the 31 tribes forming the Powhatan Confederation was ruled by a *werowance*, or chief. They in turn were subject to Powhatan.

The Rappahannocks participated in the native attacks on the colony of Virginia in 1622 and again in 1644. In addition, there was specific trouble with the Rappahannocks in 1655. By then, English

settlers had begun to encroach on Rappahannock lands. In 1656, the Virginia House of Burgesses ordered a march against the Rappahannocks. One hundred seventy men took part in the raid. The attacks caused serious damage to Rappahannock villages. That same year, the English signed a treaty with the Rappahannocks, delineating territories. It was almost immediately ignored, however, by settlers moving west. By the late 1660s, the Rappahannocks had been forced to give up their lands guaranteed by the treaty and began to move toward the falls of the Mattaponi River.

In the 1670s and 1680s, war between the Rappahannocks and white settlers resulted in many deaths and a forced migration of the Rappahannocks even farther west. The Virginia-Indian Treaty of 1677/1680 made the Rappahannocks tributaries to the English Crown and subservient to the Pamunkeys. That arrangement lasted for less than a year, however. By the 1680s, the Rappahannocks had retreated to a reserve along the Portobago Bay. By the beginning of the 18th century, the Rappahannocks had dwindled to perhaps fewer than 50 families, nearly all of whom were living in Virginia's Essex County.

Recruitment

Recruitment refers to the enlistment of individuals into military service, through voluntary or forcible means. Prior to the creation of standing armies in Europe, all free men were expected to serve when necessary to defend their particular state. This often included a mandatory form of annual training or drilling and, in some countries, indefinite service during wartime. With the rise of standing armies, a larger number of recruits were needed for full-time employment in military forces. Voluntary enlistment was often encouraged by the offer of a bounty, a cash payment in exchange for enlisting.

Volunteers almost never provided sufficient numbers to fill the military ranks, even with the incentive of bounties. European forces thus turned to compulsory service, through impressment, to fill manpower needs. Impressment consisted of forcing individuals to

join the military, and usually included drawing recruits from the lowest classes of society. It was eventually superseded by conscription, when locales were required to provide a quota of recruits for the military forces. In Prussia, conscription was regionalized. Each Prussian regiment drew conscripts from a particular canton as necessary, ensuring a shared bond among the members of the unit.

Compulsory military service, through impressment or conscription, typically lowered troop morale and provoked higher desertion rates among enlisted personnel than in all-volunteer forces. However, when conducted equitably, conscription proved more popular than the arbitrary process of impressment. Under both impressment and conscription, individuals chosen to serve were typically given the opportunity to hire a substitute to take their place in the ranks. The ranks were further swelled by the court system, which in many European countries gave convicted criminals the option of volunteering for military service to avoid imprisonment. It is not surprising that colonial military forces were often considered to be filled by the dregs of society, men who could not obtain employment in any other capacity.

In the North American colonies, the legacy of compulsory service was manifested in mandatory militia service for all free adult males. In each colony, whether English, French, or Dutch, free men were expected to serve as a defensive or reactionary force in times of emergency, but militias rarely served outside their colonial borders. Militia forces in the colonies often served as recruitment pools for European military forces, who found the militia members a convenient target for impressment. Although the regular forces tended to be filled by recruits from the lowest segment of society, the militia contained men from all walks of life and economic classes, which only increased the resentment associated with forcible recruitment into regular military service.

Redoubt

Relatively unsophisticated defensive field fortification employed both in Europe and North America during the 17th and 18th centuries. Usually intended to be temporary, redoubts were generally compact, fully enclosed, and designed to be defended by no more than a few hundred men. They had no set shape or size and were constructed to exploit natural advantages in terrain. Despite their lack of specified design, redoubts frequently incorporated many of the elements common to more complex and permanent Europeanstyle fortifications.

Typically North American redoubts of the late colonial or revolutionary eras were constructed primarily of earth. They might boast a stone foundation and be faced with timber or dry-stacked masonry to provide support and prevent erosion. The defenders fired over the parapet from a banquette or raised firing step. A ditch or dry moat with stone scarp and counterscarp surrounded the works as an obstacle to attackers. Redoubts might also include platforms and embrasures for the mounting of light artillery.

Although many redoubts were of a simple, square construction, some possessed reentrant angles. These allowed the defenders to employ interlocking fields of fire. Redoubts did not contain barracks or other facilities common in larger fortifications, as they were used strictly as defensive works.

Engineers often constructed redoubts as standalone fortifications to guard key pieces of terrain, forts, or avenues of approach. In a late-18th-century treatise on field fortifications, the author suggested that a redoubt could be used "to defend a defile, a bridge, [or] a ford."

Redoubts might also serve as outworks to larger fortifications. The designers of a fort could position a redoubt outside of the principal defensive works to cover an avenue of approach that could not be observed or fired on from the main fortification. A redoubt might also be constructed to deny advantageous terrain to an enemy attempting to besiege the main fortification. When the British began construction of their massive fortification at Crown Point on Lake Champlain in 1759, for example, they erected three redoubts to protect the southern and eastern approaches to the main fortress.

A network of redoubts might also serve in lieu of a single, large fortification. Fortress West Point, used by the Continental Army to deny the British access to the upper Hudson River during the American Revolutionary War, was fundamentally a collection of mutually supporting redoubts. Because of the numerous, commanding heights in this part of the Hudson Highlands, one single fortification would have been easily dominated by nearby high ground. A series of redoubts, capable of interlocking fires, and constructed on various prominent terrain features not only denied this terrain to potential attackers but made the space in between the redoubts susceptible to deadly musket and cannon fire.

Red Shoe

Born: ca. 1705 Died: June 23, 1747

Choctaw war chief who lived in present-day Mississippi, also known as Soulier Rouge, Soulouche Oumastabé, and Shulush Homa. The term "Red Shoe" was a title given to all Choctaw war chiefs, but the name has been linked historically to one particular leader.

Red Shoe was born around 1705 into a common family in the village of Couechitto. While still a warrior, Red Shoe was named speaker for the Choctaws' civil chief, Mingo Tchito, an office that required him to explicate the chief's positions. Such a position ultimately testified to his persuasiveness, and persuasiveness (and generosity) were key qualities expected of a Choctaw leader. Through his success in the Chickasaw Wars, Red Shoe rose to the rank of war chief, the highest position to which someone of his status could normally aspire. Although war chief was normally a temporary position, he appears to have retained it on a permanent basis.

Mingo Tchito, the head chief of Couechitto, had been recognized by the French (if not by all Choctaws) as the leader of the Choctaw Nation. The French cemented their alliance, as was the custom, with a stream of trade goods as gifts, which Mingo Tchito and other civil chiefs redistributed to bolster their positions as tribal leaders. Mingo Tchito occasionally played the colonists against each other and sent Red Shoe to contact English traders whenever corruption, mismanagement, or accidents made French gifts scarce. In 1729, Red Shoe advocated a permanent alliance with the more reliable—though distant—English. Mingo Tchito, however, who was content to use the English to keep the French pliable, ignored the advice.

Also in 1729, the French called on the Choctaws to help suppress the Natchez, who had revolted with English and Chickasaw support. Red Shoe managed to recover women, children, and African slaves whom the Natchez had seized, and returned them to the French in exchange for a substantial quantity of trade goods. This act provided him, for the first time, with the wherewithal to establish his own generosity and build a faction within the tribe.

In 1732, after Mingo Tchito resisted French entreaties to attack the Chickasaws, Red Shoe led 30 young warriors against a Chickasaw hunting party. Essentially, Red Shoe had plunged his people into war on his own initiative. In doing so, he earned the gratitude of the French and became the only war chief to receive gifts regularly. He also disrupted the traditional Choctaw social and political hierarchy, and alienated Mingo Tchito and the other civil chiefs, who refused to accept him as an equal.

During the 1730s and 1740s, Red Shoe was preoccupied with warfare and the search for European trade goods. The French would reward him for attacking the Chickasaws, and the English for making peace with the Chickasaws. These gifts made it possible to hold his faction together despite the resentment of the traditional chiefs and the distrust of virtually all sides. He also manipulated a grow-

ing gulf between the common warriors and the civil chiefs, whom he accused of not redistributing goods sufficiently.

In 1743, Pierre de Rigaud de Vaudreuil, the new governor of Louisiana, restructured the gift-giving system, eliminating Red Shoe from it. Red Shoe then sought to forge an alliance with the Chickasaws, the Creeks, and the English. Meanwhile, the French tried to form an alliance with the Chickasaws, the Creeks, and the Choctaw civil chiefs. The outbreak of King George's War (1744–1748), however, disrupted the flow of French goods. Support among the Choctaws shifted toward Red Shoe as the supply of French gifts and trade dried up. But Red Shoe's killing of three Frenchmen initiated a crisis in French-Choctaw relations and among the tribal factions. In response, Vaudreuil put a price on Red Shoe's head, and on June 23, 1747, just as Red Shoe had achieved an alliance with South Carolina, he was assassinated. The intratribal code of revenge, triggered by the assassination, added to the already growing divisions within Choctaw society and sparked the Choctaw Civil War, which lasted until 1750.

Requisition System

Means by which troops and military expeditions were supplied in colonial North America. The system for providing supplies to troops in colonial North America involved a combination of private and state interests and institutions. Prominent among items that had to be acquired locally were food, transport, and construction materials. The acquisition of supplies in the field was often difficult because of the sparse and widely dispersed nature of North American settlement.

In New York, which had the longest experience hosting regular British Army troops, supplying the army in the 17th century was the concern of local entrepreneurs. From Queen Anne's War (1702–1713) to King George's War (1744–1748), the governor established his own provisioning monopoly. This made matters more predictable for the local entrepreneurs, who became the governor's subcontractors. But it also meant that most of the profits remained with the governor. After King George's War, and as the scale and profit of the operation increased, influential London-based merchants assumed control and the local entrepreneurs became their subcontractors. That increased the independence of the latter from the governor. Nevertheless, money shortages and unpaid bills for

supplies were constant problems. During the French and Indian War (1754–1763) the troops suffered in abysmal conditions until 1756, when New York's Independent Companies were incorporated into larger units arriving from Great Britain.

Jealousy and competitiveness among colonies could be an added problem to requisitioning. In 1755, the Virginia assembly was reluctant to provide transportation for Major General Edward Braddock's campaign against Fort Duquesne because it believed that Pennsylvania and Maryland had not done enough. Moreover, the transport teams that Maryland did provide refused to cross into Virginia. The expedition might never have begun had not Benjamin Franklin persuaded Pennsylvania farmers to provide 150 wagons with drivers and 259 horses by combining promises of payment, appeals to patriotism, and threats of army retribution should they fail to cooperate.

The British paid cash for supplies when they had it on hand—which was not often the case—and when suppliers were willing. However, they resorted to impressment on other occasions. Colonial troops, rather than British regulars, generally carried out the impressment to minimize the local hostility it often generated. Merchants and farmers complained that the army frequently failed to return the wagons and horses that it borrowed. Obtaining compensation was difficult and frustrating, sometimes requiring lengthy and expensive stays in a provincial capital. Locals sometimes attempted to avoid impressment by concealing supplies or by overusing horses while they still had them. And local officials sympathetic to their predicament would sometimes undermine the execution of such orders.

Originally, for provincial forces each colony appointed a civilian "committee of war" to obtain supplies for its own troops and transport them to the front. Supplies came under military control only on arrival at the regimental commissary. This system complicated matters, especially when troops from several colonies combined for an operation. In 1756, John Campbell, Lord Loudoun, the British commander in chief in North America, brought the provincial supply system under his control, through the regular army commissaries. He did so largely because of his suspicions that colonial officials were trying to undermine the war effort. Before the colonial governments would agree to this, however, Loudoun had to assure them of two things. First, he promised that his control of the supply system did not signify regular army command over the provincial troops themselves. Second, he agreed that the colonies would continue to receive compensation for the provisions that they supplied through him. The result should have been a more standardized, rational, and efficient system; but Loudoun's continued efforts to control provincial officers and even governors and legislatures alienated the colonists to the point of paralyzing the war effort until his replacement arrived in 1758.

New France had a considerably smaller population and agricultural base. In the 17th century, food for the troops had to be shipped directly from France. In the 18th century, much of the wheat and peas and perhaps half the required meat could be acquired locally in Canada, less in Louisiana or on Cape Breton Island. A bad har-

vest or enemy disruption of the shipping lanes would create serious problems. The ninefold increase in the number of troops in Canada during the 1750s contributed to a general food crisis and inflation, yet in the end supplies seem to have been found, sometimes from unscrupulous British colonists.

Rhett, William

Born: 1666

Died: January 11, 1723

English-born merchant, planter, politician, and military officer in South Carolina. Born in London in 1666, William Rhett arrived in Carolina in 1694. From about 1699 to 1703 he commanded a merchant vessel. A devout Anglican, Rhett belonged to the faction that dominated local colonial politics. He and his brother-in-law had great influence with Carolina's proprietors, who allowed them to control much of the business and political life of Charles Town (today Charleston).

During Queen Anne's War (1702–1713), in 1706 English seamen sighted a joint Spanish-French expedition en route to Charles Town. Rhett, as lieutenant colonel in charge of the militia, sent out the call to arms on August 24. As the attackers hesitated offshore, Gov. Edward Tynte commissioned Rhett vice admiral, placed him in command of six vessels, and sent him out to engage the enemy. Rhett's small fleet captured one of the enemy vessels and drove off the others.

Between 1711 and 1716, Rhett filled several official posts concurrently: receiver general of the quitrents, naval officer in charge of port records, speaker of the colonial assembly's lower house, and surveyor general of the customs. He failed to win reelection to the assembly in 1716 because of the conflicts of interest engendered by his multiple appointments.

South Carolina called on Rhett's military experience during the Yamasee War (1715–1717), when he served as a militia colonel. Again, in 1718, when pirates preyed on Charles Town's oceangoing trade,

Rhett went to sea, this time in command of two 8-gun privateer sloops. On September 27, 1718, he captured the notorious pirate Stede Bonnet on the Cape Fear River after a fierce six-hour engagement.

Rhett took up arms again in May 1721. A rebellious faction sought to end the proprietors' hold on South Carolina and establish it as a royal colony. When the rebels declared James Moore Jr. as provisional governor, Rhett and the deposed proprietary governor, Robert Johnson, marched on Charleston with a small force of 120 men. They withdrew without a fight, however, when Moore refused to yield.

Rhett continued to resist the change of government. When South Carolina's first royal governor, Francis Nicholson, arrived in Charles Town, he accused Rhett—who remained in his post as surveyor general of the customs—of corruption. Only Rhett's sudden death at Charles Town on January 11, 1723, ended the matter.

Rhode Island

New England colony located between Massachusetts to the north and east, Connecticut to the west, and the Atlantic Ocean to the south. A haven for religious dissidents, Rhode Island struggled to achieve a consensus sufficient to govern itself. The leaders of neighboring colonies, especially Massachusetts, tried unsuccessfully to turn the discord to their advantage and expand their borders.

Massachusetts banished first Roger Williams, then Anne Hutchinson, for their religious beliefs. In 1636, Williams and his followers founded Providence, Rhode Island. Within two years, Hutchinson and her followers founded Portsmouth, though William Coddington led a faction that split from Hutchinson's group and established Newport. In 1643, Samuel Gorton and his followers abandoned Newport to establish Warwick. Each new settlement occupied land purchased from the Narragansetts.

The Algonquian-speaking Narragansetts—probably about 5,000 people in the early 1600s—occupied most of Rhode Island. The Narragansetts had driven the Wampanoags from Rhode Island north to Massachusetts. They then allied themselves with the English of Massachusetts to crush the Pequots during the Pequot War (1636–1638). Initially, Narragansett sachems (chiefs) Canonicus and Miantonomo welcomed Williams and the other dissidents as protection from Wampanoag attacks.

Although the inhabitants of the four Rhode Island settlements distrusted one another, they gradually forged a joint government based on representative democracy and religious liberty. As a result, Rhode Island found itself an outcast among the other English colonies. In 1644, however, Parliament granted a founding charter to Williams.

Rhode Island's English population gradually encroached on Narragansett territory. When King Philip's War began in 1675 between the Wampanoags and the English of Plymouth and Massachusetts, the Narragansetts at first tried to remain neutral. The Rhode Island government also declared neutrality and declined to provide troops. But it did permit Rhode Island ships to transport fighting men from the other colonies. In December 1675, Rhode Island ships carried some 1,100 New England militiamen and their native allies to attack a Narragansett stronghold in the middle of a Rhode Island swamp. The Great Swamp Fight of December 1675 ended with 240 English and more than 900 Narragansetts killed and wounded.

The Narragansetts immediately abandoned their neutrality and entered the war on the side of their former enemies, the Wampanoags. The Narragansetts burned several Rhode Island towns, including Warwick and Providence. Rhode Island then began allowing outside militias to enter the colony in pursuit of the Narragansetts. Finally, officials looked the other way while Rhode Island men actively fought the natives. King Philip's War ended in 1676 with the Narragansett population reduced to only a few hundred people.

English settlers from neighboring colonies flowed into the vacuum created by the destruction of the Narragansett, threatening Rhode Island's autonomy. Then, in 1687, King James II forced Rhode Island into the Dominion of New England. The governor, Edmund Andros, proved so unpopular, however, that Boston rebels arrested and jailed him in 1689.

In 1690, during King William's War (1689–1697), French vessels plundered Block Island, off Rhode Island's southern coast. Rhode Island sent out two ships to confront them, and in the ensuing battle drove off the attackers. During the remainder of the war, the French attacked Block Island three more times and succeeded in moving ashore twice.

After decades of contention, Rhode Island elected a governor capable of uniting and leading the colony. Samuel Cranston governed Rhode Island from 1698 to 1727. During his tenure, the colony prospered, as oceangoing trade out of Newport powered its economic growth. Rhode Island's traders exported cattle, imported molasses from the West Indies, distilled rum for export, and traded in slaves. Rhode Island had ruled in 1652 that no person of any race could be held in bondage for longer than 10 years. Nevertheless, by the end of the colonial period, Rhode Island's population of 60,000 included an estimated 3,700 African slaves.

Despite Rhode Island's substantial population of Quaker pacifists, Governor Cranston convinced the colony to support England during the wars against the French. During Queen Anne's War (1702–1713), Rhode Island provided ships and militiamen for cam-

paigns against French shipping and possessions. During King George's War (1744–1748) and the French and Indian War (1754–1763), Rhode Islanders again fitted out and manned warships. At the same time, many of its merchants continued to trade with the enemy.

Rhode Island merchants also resorted to smuggling to evade paying duties, and Royal Navy vessels patrolled the coast to intercept such vessels. On the night of June 9, 1772, one of the patrol ships, the *Gaspée*, ran aground near Providence while pursuing a smuggler, whereupon a party of men from Providence attacked the stranded ship and burned it to the waterline. Despite the offer of a generous reward, nobody came forward with information and the raid went unpunished.

Ribault, Jean

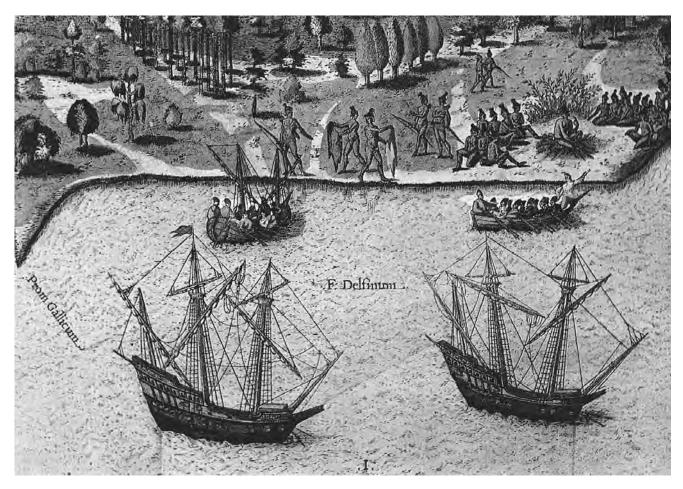

Born: ca. 1520

Died: October 12, 1565

French Huguenot explorer who sought to establish a French Huguenot colony along the southeast coast of North America. Jean Ribault (sometimes given as Ribaut) was born in Dieppe, France, about 1520. Little is known of his early years, but growing up at a seaport on the English Channel, Ribault became an experienced mariner.

In 1562, Ribault was selected to lead an expedition to the New World with the goal of establishing a haven for French Huguenots there. In February 1562, Ribault departed France with a party of some 150 Huguenots in several ships. During the voyage he pioneered a new course to the New World, traveling due west instead of following the southern trade winds. Ribault arrived off the southeast coast of North America undetected by the Spanish, having completed the transatlantic voyage in just 10 weeks.

On April 30, 1562, Ribault and his followers made landfall near present-day Jacksonville, Florida, and explored the mouth of the St. Johns River. They then moved north to establish the colony of Charlesfort (in honor of King Charles IX of France) on Parris Island,

South Carolina, near present-day Beaufort, South Carolina. Ribault oversaw the initial settlement of the colony.

In July 1562, Ribault returned to France for more supplies. He found France in chaos. The country was in the midst of religious war with Catholics and Huguenots fighting each other. Ribault fled to England seeking assistance from Queen Elizabeth I, but authorities there arrested him and imprisoned him in the Tower of London in the belief that he was seeking English ships to aid in French colonization efforts.

While Ribault was in Europe, the colony at Charlesfort fell on hard times. Most of the settlers followed Ribault's second in command, René Goulaine de Laudonnière, south to establish a new French settlement near the mouth of the St. Johns River in 1564 at a site named Fort Caroline. Here too there were problems, especially over the shortage of food, no doubt abetted by tensions with neighboring natives.

Released from prison, Ribault again sailed for the New World, this time with some 600 settlers and supplies in seven ships to aid the struggling colony. In September, he arrived at Fort Caroline. By that time the Spanish, who claimed the territory, had learned of the French colony, and Pedro Menéndez de Avilés had arrived in

August with a sizable Spanish force and established a post at St. Augustine. The Spanish then prepared to attack the encroaching French heretics.

Ribault had been moving down the coast in his ships, apparently with the intention to stage a preemptive attack on the Spanish. This plan might have succeeded save for the arrival of a hurricane, which destroyed the French ships. Fewer than 400 of the French, including Ribault, survived. With Fort Caroline poorly defended, Menéndez marched his forces overland and obliterated the settlement. The Spanish soldiers then marched back down the coast to intercept the shipwrecked French soldiers at Matanzas Bay. After fruitless negotiations, Menéndez ordered the execution of the approximately 350 remaining Frenchmen on October 12, 1565, Ribault among them. Laudonnière was one of the few Frenchmen to survive the attack on Fort Caroline, escaping to the coast and eventually making his way back to France. In 1586, Laudonnière wrote a history of the French effort, titled *Histoire notable de la Floride* (Florida's Notable History).

Rifle

The rifle is an individual firearm. The first muzzle-loading rifles were identical in firing mechanism, means of loading, and general outward appearance to the smoothbore musket. The difference was that the rifle had a spiral twist of lands and grooves on the internal surface of the barrel. Known as rifling, these imparted spin to the round ball and gave it far greater accuracy at much greater distances. Ironically, rifling seems to have been designed not to improve accuracy but rather to collect fouling, which occurred with the black powder, and to ease the loading of the bullet, which had to be pushed down the bore with a ramrod. Rifling proved to be one of the most important inventions in the history of weaponry.

Thus although the range at which an individual with a smoothbore musket would be expected to hit a man-sized target might be only 50–100 yards, the rifle had an effective range of up to 200 or even 300 yards. Such advantage, however, was offset by its much slower rate of fire because of the reduced windage (the difference between the diameters of the ball and of the bore) in order that the soft lead ball would take to the rifling. The difficulty of loading meant that the rifle could fire only about one shot per minute as opposed to three to four shots per minute for a well-trained soldier with a smoothbore musket. Hence, rifles were not suited for the tactics of the day that stressed massed close-in fire.

Rifling was probably invented in Germany as early as the late 15th century, but it came into widespread use in the first quarter of the 16th century. The earliest extant rifle dates from 1547. Although spiral grooves and lands became the most accepted form of rifling, straight grooves and lands also existed. The first centers of rifle manufacture were Scandinavia and north Europe, perhaps because the big game for which these weapons were especially useful in hunting were to be found chiefly in these regions. The Germans first employed rifles for military purposes in 1631. The men armed with rifles were known as jägers from the German word for "hunter." Many riflemen were former gamekeepers and foresters. King Frederick II (the Great, 1740–1786) raised the first permanent corps of jägers in the Prussian Army.

Rifles were especially favored in America, where their long-range accuracy made them ideal for hunting game, especially on the frontier. They probably first arrived in America in the late 17th century and, by the 1740s, were being manufactured in Pennsylvania and other, chiefly southern, colonies. Most colonists, however, preferred the more robust and less demanding musket, which provided sufficient accuracy for most hunting and effective self-defense.

American rifles of the period usually had octagonal barrels of greater than 40 inches in length. Calibers varied widely but most usually were .52 to .65, making them somewhat smaller than those of smoothbore muskets. Their stocks were often of maple with brass furniture. They also featured wooden ramrods and patchbox cover. The rifle was loaded with loose powder from a powder horn, poured down the barrel, followed by the ball wrapped in a greased cloth patch, which was then rammed home. The most common firing mechanism was the flintlock, also employed on the musket.

The importance of rifles in America has been exaggerated, but they were employed by some militias and used in the colonial wars, most notably the French and Indian War (1754–1763). Some Native Americans, notably the Shawnees and the Delawares, also employed them. Rifles were not equipped either with slings or with lugs for mounting the bayonet.

During the American Revolutionary War, the Continental Army boasted special units armed with the so-called Pennsylvania or Kentucky rifle as skirmishers to fire on British officers from long range. More limited numbers of opposing British and German soldiers were also armed with this weapon, although French troops who fought in America seem not to have been similarly equipped.

Rigaud de Vaudreuil de Cavagnial, Philippe de, Marquis de Vaudreuil

Born: ca. 1643

Died: October 10, 1725

French soldier, strategist, and governor of New France (1703–1725). Philippe Rigaud de Vaudreuil de Cavagnial, Marquis de Vaudreuil, was born into the old provincial French nobility about 1643 near Revel in southern France. In 1672, Vaudreuil joined the musketeers of Louis XIV's household and subsequently campaigned with distinction in Flanders and in Germany.

In 1687, Vaudreuil was appointed to command colonial troops in Canada. Arriving in Quebec that same year, Vaudreuil gradually earned the respect of his superiors by leading a number of successful expeditions against the Iroquois. In 1698, the Crown recognized his valor by awarding him the Cross of Saint Louis. Soon appointed governor of Montreal, Vaudreuil became governor-general of New France in 1703. France was then involved in Queen Anne's War, and Vaudreuil faced the challenge of defending the colony against the

Pierre de Rigaud, Marquis de Vaudreuil, the last French colonial governor of Canada. His refusal to release the artillery of Quebec may have cost the French the victory in the battle before the city on September 13, 1759. (Library of Congress)

British while maintaining its alliances with the western tribes and preserving a fragile peace with the Iroquois. Lacking the necessary men and matériel to mount large-scale military operations, Vaudreuil orchestrated a guerrilla offensive against New England, which allowed the Canadians to retain the upper hand until the close of the war.

In an attempt to secure French commercial and strategic interests in the Great Lakes region following the 1713 Treaty of Utrecht, Vaudreuil inaugurated a new period of western expansion by garrisoning abandoned posts, establishing new ones, and generally encouraging the fur trade. This, combined with a policy of present giving, was meant to consolidate the American Indian alliances. Such ties were instrumental to France's economic and military survival in North America.

Dealing with the aggressions of the Fox Nation first by dispatching a punitive expedition in 1716 and later by settling for a truce in 1721, the governor increasingly perceived that New France's greatest threat lay in British colonial ambitions. To limit the westward push of New York traders, he ordered the construction of a series of forts on the shores of Lake Ontario. In the East, he secretly supplied the Abenakis and encouraged them to wage war on the colonists of New England.

Vaudreuil died at Quebec on October 10, 1725, convinced that peaceful coexistence between French and British colonies in North American would be impossible. His reputation as a staunch defender of New France and his popularity among the Canadian population were instrumental to the appointment of his son Pierre to the position of governor in 1755.

Rigaud de Vaudreuil de Cavagnial, Pierre de, Marquis de Vaudreuil

Born: November 22, 1698 Died: August 14, 1778

French military officer, governor of Trois-Rivières (1733–1742), governor of Louisiana (1743–1753), and the last governor-general of New France (1755–1760). Pierre de Rigaud de Vaudreuil de Cavagnial was born in Quebec on November 22, 1698. He would benefit handsomely throughout his career from the reputation of his father, Philippe de Rigaud de Vaudreuil, who served as governor of New France from 1703 to 1725. Commissioned an ensign in the troupes de la marine (provincial regulars) at the age of 10, he was promoted to the rank of lieutenant in 1711 and to captain in 1715.

During much of his early career, young Vaudreuil assisted his father. In the process he acquired a firm grasp of colonial administration, military affairs, and indigenous diplomacy. In 1727, a year after having been made major, Vaudreuil took part in Constant Le Marchand de Lignery's punitive expedition against the Fox Nation. Having found a protector in Jean-Frédéric Phélypeaux, Comte de Maurepas, the French minister of marine, Vaudreuil was shortly thereafter promoted to adjutant. In 1730, he received the Cross of Saint Louis and promotion to the rank of lieutenant commander on the naval list.

Following an uneventful term as governor of the Canadian outpost of Trois-Rivières (1733–1742), Vaudreuil became governor of Louisiana. Over the course of the following decade, he attempted to set that colony's defenses in order and succeeded in solidifying native alliances in the face of the threat from Britain. Leaving Louisiana in 1753, he spent two years in France.

On January 1, 1755, Vaudreuil officially became the first Canadian-born governor of New France. Landing at Quebec in June, he found himself at the head of a colony embroiled in the French and Indian War (1754–1763). As commander in chief of the French armed forces in North America, Vaudreuil firmly held that an aggressive strategy, in which guerilla warfare figured prominently, would compel the British to divert their resources and thus diminish the threat. Not surprisingly, this brought the governor into disagreement with the metropolitan general officers entrusted with the tactical control of the forces—Jean-Armand de Dieskau and Louis-Joseph, Marquis de Montcalm—who advocated a more conventionally European style of warfare.

During the early years of the war, Vaudreuil's approach in fact proved judicious, but in 1758 the exterior defenses of the colony began to crumble. The governor's failure to fortify the lower St. Lawrence River allowed a British fleet to reach Quebec during the spring of 1759 and led to the capture of the city. Vaudreuil had also refused to release artillery that formed part of the city's defenses to Montcalm for employment against the English outside of Quebec.

Montcalm's death in the Battle of the Plains of Abraham and his replacement by François Gaston de Lévis at last resulted in a measure of harmony within the French high command. Yet the energetic counteroffensive mounted by both men in 1760 proved insufficient, and the British were soon at the gates of Montreal. On September 8, 1760, overwhelmed and unwilling to risk the safety of the Canadian population, Vaudreuil surrendered Canada, Acadia, and the Western posts as far as Illinois country to Great Britain. Because the terms of the capitulation had not protected the honor of French troops, this effectively put an end to his career. On his return to France, Vaudreuil became a scapegoat for the loss of New France and was briefly imprisoned and brought to trial. Acquitted in December 1763, Vaudreuil spent the remainder of his life in quiet retirement. He died in Paris on August 14, 1778.

Right of Conquest

The legal precept that a nation, either through military victory or conquest, can assert ownership over territories and their inhabi-

tants that it has captured. Any local residents of the conquered territory automatically lose their right of self-determination to the conquering power. International law generally recognized the right of conquest from the 16th century until the early 20th century.

Inspired by the 16th-century examples of the Spanish and the Portuguese in the Americas, legal thinkers in England justified war on the Irish by arguing that the religious beliefs of the Irish proved their barbarous condition. They also used the right of conquest to rationalize their subsequent subjugation of the Irish. The English expanded these legal doctrines of conquest during the colonization of North America. They argued that the natives of North America, because of their alleged incivility, could not possess territory under international law. Thus, lands belonging to the Native Americans would pass by right to the conquering English. Invoking the "right of discovery," English jurists proposed that the act of "discovering" or settling on a territory populated by a "barbarous" people was sufficient for ownership.

The right of conquest was a way for the English legally to rebuke encroachments by other European powers onto their American colonies. Thus, according to the English, the Native Americans had no right to transfer land that had already been conquered by the English to other European nations. The Spanish and the French were more likely than the English to have engaged in an ethical debate over the rights of the indigenous peoples in the Americas.

There were clear contradictions within the concept of the right of conquest, however. For example, the English colonists, and later the Americans, entered into numerous treaties with Native Americans. This implied that the Native Americans had sovereignty over their land. The English quite often disregarded these treaties, however, when they were no longer expedient.

Primarily, the right of conquest, in upholding the idea of "might is right," justified for the Europeans everything from the enslavement of Native Americans to their brutal displacement from coveted territory. An explicitly imperial doctrine, it was largely accepted until the early 20th century, when the idea of "self-determination" emerged from World War I.

Rising, Johan Classon

Born: 1617 Died: April 1672

Last governor of New Sweden (Delaware) from 1654–1655. Born in Risinge, Parish Ostergotlandslan, Sweden, in 1617, Johan Classon Rising was the son of a local pastor. He studied history and law and received a doctorate from Uppsala University in 1640. He then traveled through Europe to observe trade and commerce. During 1651–1653, he was secretary of the Commercial College of Sweden. Rising wrote two influential books on economic theory and received a knighthood.

When, after years of neglect, the Swedish government rekindled its interest in New Sweden, it sent Rising and several hundred settlers to revive the colony. The expedition arrived in May 1654. Finding that the previous governor, Johan Björnsson Printz, had departed for Sweden, Rising took over as governor from Printz's son-in-law.

Contemporary print of Johan Classon Rising, the last governor of New Sweden. (North Wind Picture Archives)

Rising's first act as governor, on May 12, 1654, was to capture nearby Fort Casimer from the Dutch, contrary to his orders. He then set to work purchasing land and food and governing the colony. He also wrote to Swedish authorities asking them to send him a good wife, one capable of hard work.

Meanwhile, Rising's capture of Fort Casimer gave Petrus Stuyvesant, governor of New Netherland, a reason for invading New Sweden. Stuyvesant recaptured Fort Casimer on September 1, 1655, and then laid siege to Swedish-held Fort Christina. As he and Rising negotiated the terms of a Swedish surrender, news of a native uprising forced Stuyvesant to hurry back to New Netherland. He offered the Swedish a return to the status quo antebellum. Rising, however, cited various excuses and refused Stuyvesant's terms. Instead, he surrendered New Sweden to the Dutch on September 15, 1655, and embarked for Europe a few weeks later. New Sweden ceased to exist.

After his return, Rising intermittently held a variety of offices as he tried to continue his writings on commerce. He fell into poverty about 12 years before his death in Stockholm in April 1672.

Roanoke Island (North Carolina)

First English settlement in North America, situated on the Outer Banks of North Carolina off the North Carolina mainland. Known as the "lost colony" because of its mysterious demise in 1590, Roanoke Island signaled the end of English efforts to colonize North America until 1606.

Roanoke Island was actually one of a series of failed settlements stemming from the sporadic nature of English exploration of North America. These began when John Cabot reached the New England coast in 1497. Fishermen soon followed, as did Cabot's son Sebastian, who explored southward in 1508 and 1509. England showed little interest in further discoveries until 1578, when Queen Elizabeth I granted brothers Martin and Sir Humphrey Gilbert a patent to colonize North America. The Crown had hopes of discovering the mythical Northwest Passage to Asia and competing with Spain for control of the Western Hemisphere. Gilbert reached Newfoundland and built a small settlement at modern-day St. John's on his second voyage in

Contemporary illustration of Sir Walter Raleigh and his men encountering Native Americans during their expedition to Roanoke Island in 1585. (Library of Congress)

1585, but he was subsequently lost at sea. His patent passed on to his half-brother, Sir Walter Raleigh, who sent Philip Amadas and Arthur Barlowe to explore the mid-Atlantic Coast. There they contacted the Roanoke American Indians and took two captives to England. That prompted Elizabeth to knight Raleigh and name the new region Virginia, a reference to her unofficial title of the "Virgin Queen."

Raleigh attempted to colonize Virginia in 1585, sending 108 men in five ships and two boats commanded by Richard Grenville. However, the expedition met with disaster when a supply ship ran aground near the barrier island (called Roanoke) he had selected as the colony's home. Grenville compounded the calamity by burning a local native village and departing, leaving Ralph Lane in command of a poorly provisioned encampment in now-hostile country. Lane also attacked the natives, provoking a series of raids that heightened the danger and worsened the food shortage.

Circumstances grew so dire that when Sir Francis Drake stopped at Roanoke in 1586 after raiding Spanish ships in the Caribbean, all but three of the surviving settlers returned to England with him. Grenville soon returned to Roanoke Island with 600 men, but when he arrived, the three men who had stayed behind were gone. Grenville left 15 settlers to hold the site and returned to England. He then passed the project on to John White, who made a serious attempt at colonization by taking 17 women, 9 children, and 94 men to Roanoke Island in 1587. When he arrived, he found no trace of the 15 men left on the island the year before. Nevertheless, he landed the new settlers and returned to England for more supplies. He hoped to see Roanoke again in 1588, but that was the year of the Spanish Armada, and war with Spain delayed his expedition until 1590.

When White finally returned in August 1590, he found no trace of the settlers, who had included his daughter, son-in-law, and granddaughter, Virginia Dare. The only hint regarding their fate were the words "Croatoan" and "Cro" found carved in a nearby fence post and tree. The Croatoans lived approximately 50 miles to the south, but persistent searches produced no sign of the lost colonists. Their fate remains unknown, though it is likely that they were killed, captured, or assimilated by local Native Americans.

England made no further efforts to colonize North America until the early 1600s. Roanoke Island proved a salutary warning of the need for proper provisions, military equipment, and a significant number of settlers in future colonization efforts.

Robertson, James

Born: June 29, 1717 Died: March 4, 1788

British Army officer and governor of occupied New York during the American Revolutionary War during 1779–1783. James Robertson was born at Newbigging near Burntisland, Scotland, on June 29, 1717. Educated in the local parish school, he enlisted in the British Army as a private soldier before 1739. Lacking the resources to purchase a commission, he became an officer based on merit.

Robertson survived campaigning against the Spanish during 1739–1740 in the West Indies that cost his regiment half its strength. Promoted to captain in 1745, Robertson served under John Campbell, Lord Loudoun, during the Scottish rebellion against the English, known as the "Forty-Five" (for 1745), and may have fought in the Battle of Culloden that same year.

Robertson then served with British forces in Ireland, and in 1755 he secured a promotion to major. Not wishing to be sent to the West Indies, he took advantage of the beginning of the French and Indian War (1754–1763) to secure appointment as a staff officer to his mentor, now new British commander in chief in North America, Lord Loudoun. After arranging for supplies, he followed Loudon to America, arriving there in 1756. Within two years Robertson was a lieutenant colonel. He was chief aide as deputy quartermaster general to Loudoun and his two successors, Major General Robert Abercromby and Major General Jeffery Amherst.

Robertson remained in America after the French and Indian War. In all, he served there for 27 years and came to be viewed as an expert on North American affairs. In 1765, he was instrumental in the passage of the highly controversial Quartering Act, which forced colonists to provide barracks for British soldiers. On passage of the act, Robertson became barrack master general, a position that allowed him to increase his personal wealth substantially. He continued to advance in rank during the 1770s, rising to major general by 1776. Robertson, who had spent most of his time in America in New York City, played a key role in the American Revolutionary War. He arranged the details of the British evacuation from Boston in March $1776\,and\,helped\,plan\,the\,British\,campaign\,in\,southern\,New\,York\,that$ same year, commanding a brigade during the Battle of Long Island. In September 1776, he took command of British forces occupying New York City, which post he retained until mid-1777, when he returned to London and reported to Lord George Germain, the secretary of state for the American Department, that he thought that the British commander in America, Major General William Howe, had been too easy on the rebels. In 1778, Robertson testified before Parliament when it investigated Howe's conduct of the war, asserting that three-quarters of Americans were loyal to Britain. He held to this opinion on his return to America as military commander of New York City and civilian governor in May of 1779. In March 1780, he was promoted to lieutenant general. With the end of the war, Robertson returned to Britain in April 1783. He died in London on March 4, 1788.

Rogers, Robert

Born: November 7, 1731 Died: May 17, 1795

English militia officer, best known for his service in the French and Indian War (1754–1763) and his leadership of Rogers' Rangers.

English colonist Robert Rogers, who organized Rogers' Rangers, a military unit specially trained to fight on the frontier and in backwoods regions during the French and Indian War. (Library of Congress)

Born in Methuen, Massachusetts, on November 7, 1731, Robert Rogers was raised in New Hampshire, where he received only a rudimentary education but developed keen skills as a woodsman and hunter. Rogers served briefly as a scout for the New Hampshire Militia during King George's War (1744–1748) but did not achieve true military distinction until the French and Indian War.

Following service early in the war with militia forces supporting British regulars in the expedition against Crown Point (New York) and battles around Lake George in 1755, Rogers received a promotion to captain. In 1756, he received orders to raise a company of rangers. Most of the men in the unit were handpicked by Rogers himself and equipped from his own means. In 1758, Rogers was promoted to major and expanded his rangers to include nine companies numbering roughly 200 men.

Rogers' Rangers, as his outfit became known, specialized in scouting and reconnaissance missions. Working in small groups, the Rangers often operated behind enemy lines gathering intelligence or engaging in raids and ambushes. All of Rogers's men were accomplished woodsmen, adept at moving swiftly through rough terrain and living resourcefully off the land. They even wore green jackets as an attempt at camouflage. The rangers demonstrated their unique mobility during the Battle on Snowshoes in 1758,

where they launched raids against enemy encampments in the dead of winter using snowshoes. Rogers became so skilled at such irregular operations that he authored a manual called *Rogers' Ranging Rules*, which detailed his tactical methodologies.

After taking part in Major General Jeffery Amherst's capture of Fort Ticonderoga and Crown Point in July 1759, Rogers achieved his greatest military success to date by executing a daring surprise attack on an Abenaki village near St. Francis, Canada, in October 1759 as retribution for the Abenakis' repeated raids, which had killed as many as 600 English colonists. Rogers' Rangers also supported Major General James Wolfe's campaign against Quebec as well as Amherst's capture of Montreal in 1760.

After Montreal fell, Amherst reassigned Rogers to the Great Lakes region to seize the remaining French fortifications there. The Rangers continued their success with several key victories, including the surrender of Fort Detroit in November 1760, which made Rogers an even greater hero in the colonies. His rangers returned to the Detroit territory again three years later to assist the British Army in suppressing Pontiac's Rebellion in 1763.

In 1765, Rogers traveled to England to compile his war memoirs and publish accounts of his heroics against the French and their native allies. He boldly asked King George III for money to fund an expedition to explore the Mississippi River to the Pacific Ocean. The king refused this audacious request, but he did reward Rogers with command of Fort Michilimackinac in present-day Michigan. As commandant of the fort, Rogers followed a path of corruption and insubordination, mostly in trying to pursue his obsession of creating an expedition to find the elusive Northwest Passage. He was arrested and tried for treason by the royal government. Acquitted in 1768, Rogers returned to England in hopes of securing another command but succeeded only in landing in debtors' prison.

At the outbreak of the American Revolutionary War, Rogers offered his services to Continental Army commander General George Washington. The general refused Rogers's offer as he did not trust his allegiance to the Patriot cause and suspected him to be a British spy. An embittered Rogers then raised his own companies of Loyalist rangers outside New York City and fought in several campaigns in 1776–1777 but did not earn any notable distinction. He returned to England in 1780, where he lived in poverty and obscurity until his death in London on May 17, 1795.

Rogers's Raid on St. Francis

Start Date: September 13, 1759 End Date: October 6, 1759

Attack by Rogers' Rangers on the Canadian town of St. Francis during the French and Indian War (1754–1763). From their town of St. Francis, the French-allied Abenaki Native Americans had raided English settlements to the south.

The Abenaki mission town of St. Francis was located close to the mouth of the river of the same name, between Montreal and Trois-Rivières. Known as Odanak to the natives, the town contained more than 60 dwellings, a Jesuit chapel, and a council house. The Abenakis used St. Francis as a base from which they launched raids against the northern English colonies. According to some reports, as many as 600 English scalps taken by the raiding parties were displayed in the town. The strong native position at St. Francis also blocked communication between British forces moving to attack Quebec and other British and colonial forces in New York and New England.

To remove this obstacle to wresting Canada from the French and their native allies, the British Army commander in North America, Major General Jeffery Amherst, ordered Major Robert Rogers, an expert at irregular warfare, to attack St. Francis. The operation was fraught with considerable risk, as it required Rogers's force to penetrate deep into French-controlled territory, country unfamiliar to the attackers.

Rogers set out from the British post at Crown Point on September 13, 1759, with a force of about 200 men, most of them Rangers, with a few British regulars and more than 20 Stockbridge Native Americans. The party traveled in whaleboats across Lake Champlain to Missisquoi Bay in present-day Vermont, where they disembarked and moved overland to St. Francis. Rogers lost about one-fourth of his men during the march to accident and disease. Also, shortly after they landed, the French discovered and destroyed their whaleboats, depriving Rogers's men of the means to return to their base by water and leaving them completely cut off in hostile territory.

Undeterred by the loss of the boats, Rogers convened a council of war. It decided to proceed with the attack on St. Francis. Rogers then planned to withdraw overland to the Fort at Number Four on the Connecticut River.

Rogers and his remaining 142 men reached their objective on the night of October 5 after a dangerous crossing of the St. Francis River. The French and their native allies were aware of the rangers' presence in the area and had parties out searching for them, but they expected Rogers to attack elsewhere. Learning from some prisoners that none of the French and native parties were near St. Francis, Rogers decided that it was safe to conceal his force and attack early the next morning.

Some accounts suggest that the Abenakis received a warning on the night of October 5 that an attack on St. Francis was imminent and that many of the town's inhabitants chose to leave. There were, nonetheless, approximately 500 people in the town the next morn-

Rogers' Rangers, shown massacring Abenaki Native Americans at St. Francis, Quebec, in October 1759. British major general Jeffery Amherst authorized the attack in retaliation for Abenaki raids on English settlements during the French and Indian War. (Library of Congress)

ing. Exhausted after a night spent celebrating a harvest festival (or wedding, according to some accounts), the Abenakis took no precautions to guard against an attack.

Rogers carefully positioned his men and then launched his assault before dawn on October 6. Some Rangers forced their way into houses and killed the occupants with tomahawks; others set fire to dwellings and shot down the inhabitants as they fled. Another body of rangers posted along the St. Francis River fired on any natives seen escaping the growing conflagration. The assault was over quickly, as the surprised Abenakis were unable to offer effective resistance.

When the fighting ended, the rangers gathered as much corn as they could carry to sustain them on their return journey. They also plundered the Jesuit chapel of its gold and silver religious artifacts. They then withdrew to escape certain pursuit. The rangers took with them a half dozen captured Abenaki women and children as well as some captives who had been held at the town. Among the latter were three members of Rogers's own ranger unit who had been taken prisoner earlier in the war.

Rogers later claimed to have killed 200 natives in the battle, thus breaking the Abenakis' ability to conduct offensive operations. French officials visiting St. Francis shortly after the attack, however,

reported having seen only 30 dead, two-thirds of whom were women and children. The actual native death toll lies somewhere between these two extremes. The rangers suffered no casualties themselves in the engagement.

The attackers then withdrew up the St. Francis River to the site of present-day Sherbrooke, then to the southeast. Near Lake Memphremagog their provisions ran out, so Rogers ordered his men to disperse into smaller parties, thus making it easier both to find game and to elude their pursuers. Slowed by hunger, exhaustion, and exposure to the cold, some groups were caught and killed by the pursuing French and natives. Rogers's own party made its way down the Passumpsic River, reaching the Connecticut River at its confluence with the Wells River about October 20. Rogers had asked Amherst to have provisions waiting there, but the British officer assigned to supply the rangers had already left the area. Rogers and the strongest of his men built a raft and floated down the Connecticut. They arrived at the Fort at Number Four on October 31, and immediately dispatched supplies and a rescue party to aid the men who had been left behind. Fewer than 100 members of the expedition eventually made their way to safety. The remainder were killed by the French and Abenakis or succumbed to starvation and exposure.

Despite the large number of casualties suffered, Rogers's raid proved a success. The loss of life among the Abenakis and the destruction of their base, along with the British capture of Quebec the month before, effectively ended the Native American threat to the northern frontier English settlements.

Rowlandson, Mary White

Born: ca. 1637 Died: 1710 or 1711

Englishwoman captured by Native Americans in 1676 and author of *The Sovereignty and Goodness of God* (1682), a narrative of her time in captivity. Mary White was born in England around 1637. Her parents left for North America in 1639, taking their daughter with them. The family settled in Lancaster, Massachusetts, where White married Joseph Rowlandson in 1656. He became a Puritan minister in Lancaster in 1660.

In February 1676, during King Philip's War (1675–1676), a band of Narragansett and Nipmuck warriors attacked Lancaster, and in the process they burned most of the settlement and took a number of captives, Mary Rowlandson among them. After her capture, she was transported with other English captives along a meandering trek through western Massachusetts before returning to an area near Lancaster where her husband paid her ransom. Her captivity lasted three months. In all, Rowlandson endured 20 "removes" (relocations), during which she suffered from exposure to the elements, hunger, and the psychological shock of captivity and fear of death.

On her release, the noted Puritan minister Increase Mather encouraged Rowlandson to publish an account of her captivity. He counseled this to help quell rumors that she had been sexually abused by her captors, and to provide a timely moral lesson for a spiritually backsliding society. Lascivious rumors and innuendo about the sexual assault of female captives prompted Rowlandson to set down the facts of the matter to deflect such gossip. She also hoped to dispel the falsehoods that might have compromised her prominent position as the wife of a clergyman.

In her captivity narrative, published in 1682, Rowlandson gave a vivid and candid account of her ordeal, carefully noting that no warrior had made any sexual advances toward her or any of the other female hostages. She heaped scorn on the "praying Indians," however, whom she regarded as spies and traitors. She interpreted

her experience as a divine chastisement for her pride and spiritual laxity, and Mather intended that New Englanders would interpret King Philip's War as a collective punishment. A classic in the popular genre of the captivity narrative, the book went through several editions throughout the rest of the 17th and 18th centuries, confirming Anglo-American society's negative assumptions about Native Americans. Meanwhile, Rowlandson moved to Wethersfield, Connecticut, where her husband had a congregation. Rowlandson died in either 1710 or 1711.

Royal Regiment of Artillery

When English colonists landed in Virginia in 1607, their army did not possess a professional artillery arm. In England prior to 1716, the artillery comprised a small nucleus of paid gunners who functioned much as a permanent militia. During emergencies, officials issued a royal warrant authorizing a train of artillery. After the train had served its purpose, it disbanded. There were never sufficient numbers of trained men to serve in the artillery, however. In addition, this method of raising a train of artillery was both expensive and inefficient. The birth of the Royal Artillery more than 100 years later changed the artillery arm to a permanent force. Thereafter, it made steady technical and professional progress.

During the War of the Spanish Succession (Queen Anne's War, 1702–1713), the Duke of Marlborough employed the English artillery contingent with great tactical skill. Thereafter, he joined a growing chorus calling for reform. Nonetheless, after peace came in 1713, the artillery arm again largely disbanded. Marlborough's call for reform and the unresponsiveness of the artillery to the outbreak of the Jacobite Rebellion of 1715 combined to prod authorities to make changes. In 1716, King George I authorized two permanent companies of gunners and matrosses (unskilled crewmen). They became the basis for the Royal Regiment of Artillery.

The so-called New Establishment of 1716 eliminated many anachronistic posts, leaving in their stead a company organization led by a captain and four lieutenants. Three sergeants and three corporals served as noncommissioned officers, and three bombardiers provided expert technical assistance. Thirty gunners filled the companies' skilled positions and 50 matrosses provided the hard labor necessary to maintain, move, and operate the artillery.

The Royal Artillery achieved regimental status in 1722, when the two original companies merged with the independent artillery companies at Gibraltar and Minorca. By then, a headquarters staff had been created with the addition of a colonel, lieutenant colonel, and major. Thereafter, the regiment expanded rapidly. By 1757 the regiment had 24 companies divided into 2 battalions and a total strength of 2,531 men. On the eve of the American Revolutionary War, the regiment had grown to 32 companies in 4 battalions along with 2 invalid companies of older, unfit men. The latter typically served as garrison troops.

Initially, officers in the Royal Artillery were promoted from the ranks, so it escaped the evils of the purchase system whereby officers actually bought their commissions. Artillery officers had to demonstrate both theoretical and practical competence in their trade. Consequently, the artillery attracted more professionally inclined officers as opposed to many of those in the other arms who joined the military for social status. The founding of the Royal Military Academy in 1741 further enhanced the artillery's professional orientation.

The first large-scale overseas deployment of the Royal Artillery Regiment took place in 1741, during the Anglo-Spanish War of 1739–1744, during the campaign against Cartagena in what is now Colombia in Central America. In North America during the French and Indian War (1754–1763), the regiment contributed about 100 officers and men and 10 light guns to Major General Edward Braddock's unsuccessful 1755 campaign against Fort Duquesne. The artillery train was not yet militarized, so 21 civilian attendants accompanied the gunners, along with 10 servants and 6 women. When the British column came under French and native ambush close to their objective, the artillerists blindly fired into the forest with little effect. During the subsequent retreat, they abandoned their guns.

Three companies of Royal Artillery participated in the British capture of the French fortress of Louisbourg in 1758. During the Battle for Quebec in 1759, an artillery subaltern led a handful of gunners in dragging a single light gun up the steep path leading to the Plains of Abraham. During the French attempt to recapture Quebec in 1760, the British defense included a complete artillery train. Just prior to the beginning of the American Revolutionary War, from 1771 to 1775, the regiment's 4th Battalion replaced the units that had previously been serving in North America. By this time, the regiment had earned a reputation for skilled professionalism.

Rum Trade

Manufacture and trade of rum between Caribbean colonies, North America, and Great Britain was a major colonial enterprise. The rum trade was intricately tied to the history of sugar plantations in the Caribbean. The islands of the Caribbean were ideal for growing sugarcane, which resulted in the establishment of hundreds of sugar plantations in the 17th and 18th centuries. Rum is distilled from molasses, a syrupy byproduct of sugar's crystallization process. Caribbean rum, with its rich color and an aroma lacking in rums brewed elsewhere, was considered the finest in the world.

The British sugar islands in the Caribbean generally fared well during the wars of the 17th and 18th centuries. Protected by the strong British Navy, these colonies were rarely attacked, and insurance rates for shipping goods remained low. Some of the French and Dutch islands did not fare as well, however. During the French and Indian War (1754–1763), the British seized the French-held island of Guadeloupe, one of the largest molasses producers in the Caribbean, forcing the French to pay dearly for its return in 1763.

The intense specialization in sugar and molasses meant that the Caribbean islands were completely dependent on imported goods for their subsistence. In exchange for sugar, the North American mainland provided Caribbean planters with lumber, grain, meat, cheese, and butter.

The sugar and rum trade was built on the backs of slaves, whose survival rates in brutal Caribbean conditions were notoriously low. A combination of tropical diseases, malnutrition, and overwork made the natural increase of the slave population impossible. In order to feed the sugar islands' voracious demand for slaves, trade runs to Africa were factored into the colonial economy.

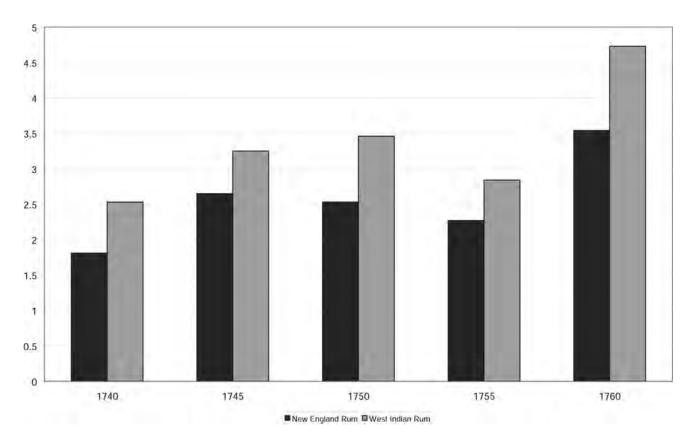

This set the stage for the infamous "triangular trade." Molasses was exported from the sugar islands to the North American mainland, where it was distilled into rum. It was then shipped to Africa, where it was traded for slaves. The slaves were sold in the Caribbean, where the labor-intensive sugar plantations were always in need of more hands.

The British sugar islands had competition from French, Dutch, and Spanish colonies in the Caribbean, which also specialized in sugarcane. British mercantile policies limited the mainland colonies from doing business with non-British sugar colonies, although the lure of cheaper sugar from French colonies was tempting to New England smugglers. British sugar was roughly 20 percent more expensive than that produced by the French.

Planters in the British Caribbean resented competition from the French and agitated for legislation to snuff out competition. The result was the 1733 Molasses Act, which placed prohibitive duties on sugar or molasses from non-British colonies. The act was only a paper victory, however, as it was routinely ignored by customs officials willing to take a bribe and smugglers willing to circumvent the law.

The British attitude of salutary neglect was changed after the conclusion of the French and Indian War in 1763, which left the English

with staggering debts and an urgent need for new revenue. The Sugar Act of 1764 changed the provisions of the old Molasses Act to include several new restrictions. The original duty of six pence per gallon of molasses was cut in half, but it was strictly enforced and applied to all sugar or molasses regardless of the source. Taxes on other commodities, such as coffee, cloth, and silk, were also subject to the tax. Ships were required to submit to stringent bonding procedures before loading their cargo. The Royal Navy's presence in the Caribbean was also expanded and charged with enforcing trade legislation. Smuggling was discouraged by much harsher punishments, including seizure of the ship and cargo. Merchants who wished to contest charges of evading the tax were forced to use vice admiralty courts, which deprived them of their right to a jury trial, statements by witnesses, cross-examination, and other rights normally granted under common law.

The result of the Sugar Act was a slump in the New England rum trade. That in turn exacerbated tensions between the mainland colonies and England. Beginning in 1764, a group of angry distillers in Boston initiated a boycott of English goods. The boycotts caused hardship to local merchants, whose imported supplies slowed to a trickle. As a result of the shortage of sugar, distillers turned to more readily available crops to make liquor. The popularity of whiskey, made from corn or rye, was a direct result of the Sugar Act.

Rush, Benjamin

Born: December 24, 1745

Died: April 1813

Colonial doctor and signer of the Declaration of Independence; known variously as "the American Sydenham" and "the American Hippocrates." Born in Byberry Township near Philadelphia on December 24, 1745, Benjamin Rush received his education at Not-

Dr. Benjamin Rush, a prominent figure in the history of American medicine and signer of the Declaration of Independence. (National Archives)

tingham Academy. He entered New Jersey College at Princeton at age 15 and graduated the following year.

Rush spent five years apprenticed to physician John Redmond, during which time he translated the *Aphorisms* of Hippocrates into English and wrote a classic account of the 1762 Philadelphia yellow fever epidemic. Rush then traveled to England, where he studied in London and received his medical degree from the University of Edinburgh in 1768. He returned to Philadelphia the following year to become professor of chemistry at John Morgan's new medical school where he, along with Morgan, William Shippen Jr., and Adam Kuhn, comprised the faculty. Rush was active in Philadelphia society and politics and was a member of the Continental Congress and signed the Declaration of Independence. He chaired the medical committee of the Continental Congress and served as physician and surgeon general of the Middle Department of the Continental Army from April 1777.

Rush became involved in Major General Thomas Conway's cabal to replace Major General George Washington and in Morgan's failed attempt to discredit Shippen. Rush resigned in 1778 but not before publishing the *Directions for Preserving the Health of Sol-*

diers, a useful compendium of recommendations on military hygiene and camp sanitation.

Following the American Revolutionary War, Rush returned to a lucrative life of teaching and practice. He fathered 13 children and is said to have educated 2,872 physicians in his career. Unfortunately, he taught vigorous purging with calomel and bleeding as the mainstays of therapy and is accused of having cost the lives of tens of thousands through his influence and misguided treatment. Nonetheless, he remained widely successful and respected as the most distinguished physician in America until his death in Philadelphia in April 1813.

Russia

In 1732, Siberian navigators Aleksei Shestakov and Mikhail Gvozdev explored the Alaskan coast of North America. In 1736, however, a report dated 1648 was discovered in a Siberian archive. Prepared by Russian explorer Simeon Dezhnev, it is believed to be the first written Russian report on the existence of what is now known as the Bering Strait, which divides Asia and North America. Geographic maps made in Moscow after 1697 and based on Siberian explorers' reports reflected the existence of islands and vast lands to the east of the Russian Pacific Coast.

In the early 18th century, Moscow's envoys to eastern Siberia provided descriptions of native people living within a one-day kayak trip from the easternmost Russian shores and reported on their customs and activities. In 1729, the first Kamchatka expedition led by Danish seaman Vitus Bering passed the strait later named after him even though he did not see the land because of fog.

In 1741, Czarina Elizabeth I ordered Bering to conduct another in-depth study of the North American coast. During this voyage, Bering calculated the distance separating Asia and North America and discovered the Aleutian Islands. The first Russian landing in North America occurred on July 15, 1741, at latitude 55° 20' north, near Baker Island.

In the course of following voyages, the Russians explored the entire northwest coast of North America. The continent aroused interest among Russian merchants and fur hunters excited by the prospects of the rich sea otter trade. With its focus on European developments at the time, however, the Russian government did not provide financial or military assistance to the merchants. Private Russian entrepreneurs conducted further exploration of North

Portrait of Czarina Catherine II, who ruled Russia during 1762–1796. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

America. Reportedly more than 110 hunting and trading expeditions were organized between 1743 and 1799.

From 1748, the Russian government granted the exclusive right to conduct trade operations in North America to selected companies in exchange for one-third of their income. In 1760, a free trade policy was declared and numerous Russian merchants profited from Alaskan natural resources, although relations between them and the native population were generally hostile. Simultaneously Russia engaged in trade exchanges with other nations' North American colonies, even though Czarina Catherine II deemed such trade to be illegal. In 1775, during the American Revolutionary War, British king George III requested a Russian expeditionary corps of 20,000 to fight against the colonies. The Russian government ignored his request and in 1780 enunciated the Declaration on Armed Neutrality to prevent the British Navy from interfering with neutral trade. Later, Russia acted as one of the mediators during peace talks between France and Britain.

In the last third of the 18th century, the Russian government focused on economic activities to secure Russia's presence in northwestern North America. It did so because its military was weak and unable to support territorial expansion and protect Russia's interests in remote colonies. The government encouraged colonization for the revenue it produced. The new Russian territories were not formally tied to the Russian Empire, however, and there was no protection of the territory occupied by Russians in North America. In 1780, Catherine II intended to send the Russian Navy

"to preserve our rights to lands discovered by Russian seamen," because an active trade had developed between English sailors and the native population of Alaska following Captain James Cook's expedition of 1778–1779. Catherine requested that the Russian flag be raised on "all lands and islands, which will be discovered if they are not yet conquered by any European state." The expedition was cancelled in 1787, however, because Russian warships were required in the Mediterranean for wars against Turkey.

There were no permanent Russian settlements in North America before the 1780s. Indeed, Russians built the first houses for fur hunters and a few armed forts only after 1780. Relations between the Russian settlers and surrounding native Aleut and Eskimo populations and militant Tlingits were usually hostile. The colonization coincided with the forced conversion of native groups to Russian Orthodox Christianity. The first official religious mission numbering eight priests arrived in Kodiak in 1794. It conducted 6,740 baptisms and 1,573 marriages during its first year.

In 1799, Czar Paul I combined all Russian trade and shipping companies in America into the government-founded Russian-American Company. It retained exclusive rights to hunt, fish, and trade to the north of latitude 55°. The Russian royal family was the major shareholder of the company. The Crown appointed chief company managers to a five-year terms, recognizing these individuals as rulers of the colony. Management was divided into four "branch managers," who oversaw colonists and natives alike.

The largest city and the capital of the Russian colony in Alaska was Sitka (Novo-Arkhangelsk). A garrison of just 70 men guarded Sitka, and its population consisted of 220 Russians and about 1,000 natives. Although the aboriginal population became Russian subjects, they were still largely managed by their tribal leaders. The native population of Russian America peaked at about 8,000 people, and remained at that number for the entire colonization period. The permanent Russian population slowly grew from 225 in 1799, to 470 in 1805, and reached about 800 in 1823.

In order to build a local supply base and restrict the intensified activity of the new United States in the regions adjoining the Spanish colonies, Russian colonies attempted to extend control over adjacent regions. As such, they tried to establish footholds in California and Hawaii. In 1790, with the hope that in the course of time a propitious moment would arrive to assert claims to the Pacific Coast of North America, the czarist government had ordered imperial markers secretly buried along the coast bearing the inscription "Land belonging to Russia." These were located along the North American mainland from Kodiak Island to California. The indecisiveness of St. Petersburg and changes in European diplomacy after the Napoleonic Wars made it impossible to transform trading posts of the Russian-American Company into a formal possession.

In 1806, Russian envoy Count Nikolai Rezanov traveled to California to negotiate trade relations with the Spaniards, who were then in possession of that territory. Rezanov developed the idea of wresting northern California from the Spaniards and proposed to occupy the region extending from the Russian colonies to San Fran-

cisco. In so doing, he hoped to attract large masses of people to the Columbia River Basin area. As a result, imperial markers were placed from latitudes 41° and 38° north, in the Bodega Bay area, the Charlotte Islands, and the shores of Trinidad Bay. The culmination of the southward expansion was the establishment of the Russian-American Company's outpost Fort Ross in the vicinity of Monterey Bay. It was a wooden fortress protected by 17 small cannon and with a tannery, mill, workshops, storage facilities, cattle shed, and other dwellings. The Russians established good relations with neighboring Native Americans, and a protocol granting lands to the Russians was signed with local native chiefs in 1817.

The Russians simply ignored the Spaniards, who dominated the colonization of northern California and were worried about possible Russian expansion in the region. Fort Ross, with its population of about 200 adults, did not contribute to the prosperity of the company and was liquidated in 1839.

The United States protested Russia's southward expansion and forced Russia to conclude the Convention on Sailing, Fishery, Trade, and Settlements in 1824. This document established the borders of Russia's colony and permitted American companies to conduct trade in Russian America. Russia's only overseas colony ceased to exist on October 6, 1867, when the United States purchased Alaska.

Ryswick, Treaty of

Event Date: September 20, 1697

Agreement that ended the War of the League of Augsburg, or King William's War (1689–1697), signed on September 20, 1697. The

peace treaty also marked the completion of the first phase of the Anglo-French struggle for supremacy in North America between 1689 and 1763.

Under the provisions of the Treaty of Ryswick, all towns and districts seized since the 1679 Treaty of Nijmegen were restored. France surrendered Freiburg, Breisach, and Phillipsburg to the Holy Roman Empire, retained Strasbourg, received Saint Domingue (Haiti), and regained Pondicherry in India and Nova Scotia in North America. The French also returned Lorraine to Leopold Joseph, a son of Charles V, Duke of Lorraine. Spain regained Catalonia and the barrier fortresses of Mons, Luxembourg, and Courtrai. The Dutch were allowed to garrison several fortresses in the Spanish Netherlands. Lastly, King Louis XIV of France recognized William III as king of England, agreed to end his interference in Cologne, and abandoned his territorial claims to the Rhenish Palatinate.

King William's War, the North American phase of the conflict, had pitted England against France at Hudson Bay, and the English and Iroquois against the French and their native allies on the New York and New England frontiers. French and Native American forces had raided several British settlements in that region. The French also repulsed an English assault on Quebec and chased the British from two Hudson Bay posts, Severn and Hayes, before the English recaptured the area. Despite victories by both sides, all French and English possessions in North America reverted to their prewar status under the terms of the treaty.

The validity of England's claims to Hudson Bay was to be decided by an Anglo-French commission, which ultimately failed to reach an agreement and disbanded two years later. Indeed, the war and the resulting Treaty of Ryswick solidified the mutual enmity between the French and British colonies in North America.

S

Sachem

Term for the leaders of certain northeastern Native American groups. Its etymology can be traced back to four northeastern bands that all used the term sachem for a similar purpose. In Narragansett, the term is *sachem*; in Delaware, it is *sakimam*; in Micmac, it is *sakumow*; and in Penobscot, it is *sagamo* (which became *sagamore*). The term sachem has come to mean any leader who is working for the best interest of his tribe. It has developed into such words as "sachemship," "sachemdom," and "sachemic."

Whereas the position of chief was based on skill, sachem was an inherited, civil position. Sachems fulfilled many roles within their tribes, but their main duties concerned land distribution, meting out justice, the collection of tribute, and receiving guests. They also sometimes supervised the direction of war and rituals. Most sachems were men, but they could be women.

The position of sachem was extremely prestigious. Although it was inherited, it carried with it great responsibility and obligation. These leaders were expected to act in the common interest at all times. They needed their people's support in order to do their job effectively and had to demonstrate skill and competence. Although they theoretically had ultimate authority, they had no way of enforcing it and thus had to rely on persuasion and consensus for their power.

The leaders of the powerful Iroquois Confederation came to be known as sachems, and today the leaders and prominent members of many aboriginal tribes are known by this traditional title.

Sailors

In a general sense, a sailor is anyone who goes to sea, either to earn his living from the sea or for recreation. More specifically, however, sailors are enlisted personnel below officers in the crew of a ship, be it a private or naval vessel.

In the colonial period, life aboard ships involved privation, discomfort, low pay, and danger. The pay, love of adventure, and the possibility of prize money (for privateer and naval vessels in wartime) were sufficient to keep most ships crewed. Only in wartime, when there was far greater need for seamen, was there general recourse to impressment, the practice of forcing individuals into military service.

Officers aboard European military vessels were typically chosen because of their wealth or family connections. Normally, young men were selected to serve as midshipmen, the most junior officer rank (although considered by some not to be a rank at all), in a period of apprenticeship. As midshipmen, they were expected to learn the mechanics of operating a ship and become accustomed to the rigors of command. They faced an examination board to demonstrate their competence prior to receiving a formal commission as a lieutenant. Once commissioned, officers usually advanced by seniority, although officers with poor reputations could be passed over for promotion. Warrant officers, so named because they held a warrant of rank from the navy of their nation rather than a formal commission, held specialized positions such

as ship's surgeon, chaplain, or purser. They enjoyed many officers' privileges but were not in the formal chain of command.

Enlisted personnel, often called seamen or ratings, were considered only in the service of their ship. They were subdivided into three major classes by ability and experience: able seamen, ordinary seamen, and boys or green hands. They generally served on the same ship until released from service at the end of a voyage. Popular and successful ships' captains attracted efficient and loyal crews, whereas commanders with poor reputations often had difficulty crewing their vessels and resorted to impressment.

On merchant ships, the same division of officers and men existed, although the specific titles applied to each rank sometimes differed. Merchant sailors tended to be older but more experienced than their naval counterparts and therefore less suited to the rigors and discipline of a naval vessel. Merchant ships offered higher pay but did not have the tremendous income potential that warships could offer through prize money (although such advantage has been distinctly overrated). During war, the value of vessels and their cargoes captured by a warship were divided, with 25 percent of the prize money designated for the ship's seamen. The capture of a heavily laden merchant ship could provide more prize money in a single engagement than a sailor could earn in years of labor on shore or on a merchant vessel. The potential for prize money was often used as a recruiting device by ship captains to crew their vessels, but the large number of privateers sent to sea in time of war often made recruitment of seamen for the regular navy difficult.

Life at sea in the colonial period was characterized by cramped quarters, hard work, extreme discipline, and poor food. Officers were entitled to a certain degree of comfort, including private or semiprivate cabins, but seamen were crowded into close holds below deck or often slept on deck. The subsistence ration on merchant and military vessels alike consisted of sea biscuit, a rock-hard flour and water concoction often infested with maggots or weevils. To eat the biscuits, sailors could gnaw on the edges or crumble the biscuit into water. The biscuits were supplemented by salted beef, salted pork, and dried vegetables. Each sailor was allotted approximately one gallon of water per day, as well as beer, wine, or grog (a mixture of rum, water, and lemon juice).

During the colonial wars in North America, sailors usually performed in a support role, ferrying troops and supplies for land forces but rarely engaging land-based fortifications directly. In King William's War (1689–1697), British vessels blockaded Port Royal, Acadia, a harbor protecting French privateers, but required provincial troops from Massachusetts to capture the port. After Port Royal surrendered, the besieging colonists were informed that they would not share in the prize money for vessels captured in the harbor, despite their obvious contribution to the navy's success. A similar situation developed during King George's War (1744–1748), when English colonists successfully besieged Louisbourg while assisted by another blockade.

The French and Indian War (1754–1763) saw significant uses of naval power in the colonies. In particular, British major general James

Wolfe's 1759 assault on Quebec required the support of 40 warships, 15,000 sailors, and more than 100 transports. In comparison, the French had only 10 warships to hold off the British onslaught. By 1759, French reinforcements and supplies from Europe had dwindled to a trickle. In that year, only 300 regulars were successfully transported from France to Canada. The British superiority at sea cut off vital supplies while continuously ferrying troops from England to assist in the final conquest of Canada. Sea power thus helped to ensure British dominance of the region and the expulsion of France from North America by 1763, and it was seamen who made that possible.

Saint Denis, Louis Juchereau de

Born: September 17, 1674 Died: June 11, 1744

French Canadian trader, explorer, and soldier. Louis Juchereau de Saint Denis was born near Quebec on September 17, 1674, and educated in France. He was a member of Pierre Le Moyne d'Iberville's Louisiana expedition, which sailed from La Rochelle in late 1699. From 1701 to 1707, Saint Denis explored the Red River from Fort St. John on the Mississippi River. He also engaged in trade with Native Americans ranging from Louisiana to modern-day east Texas. Saint Denis also commanded Fort de la Boulaye until 1707. After that, he remained in the New Orleans vicinity and became a successful native agent.

In September 1713, Saint Denis led a company from Mobile to the Natchitoches villages of the Hasinais. Entering New Spain at San Juan Bautista (on the Rio Grande River), he was arrested for carrying proscribed goods. While there, he married the granddaughter of the Spanish commander. Called to Mexico City, he defended himself so well that he became commissary officer of the expedition that in 1716–1717 established a presidio and six missions in eastern Texas.

Returning to San Juan Bautista in April 1717, Saint Denis found that Queen Anne's War (1702–1713) had thoroughly soured relations between France and Spain. He subsequently went back to

Mexico City, then Natchitoches, arriving there in February 1719. From 1720 on, he engaged in a robust trade with Native Americans, acted as an intermediary between the Spanish and the French, and amassed a small fortune. In 1743 he asked to retire to New Spain. French authorities refused his request. Saint Denis died in Natchitoches on June 11, 1744.

Sainte Foy, Battle of

See Quebec, French Attempt to Recapture

Sainte Thérèse, Battle of Event Date: June 16,1670

The fortified village of Sainte Thérèse figured prominently in the last campaign in Canada during the French and Indian War (1754–1763). Some 25 miles southeast of Montreal, Sainte Thérèse was an important French communications link situated at the upper end of the Chambly rapids and five miles south of Fort Chambly.

In the spring of 1760, the British commander in North America, Major General Jeffery Amherst, made preparations to move against Montreal, take the last large town in New France, and end the war. In early May, however, Amherst learned that the French commander, Major General François de Lévis, had gathered contingents from the Richelieu River forts at Chambly, St.-Jean, and Île-aux-Noix. He had done so in order to strength his own forces preparing to move on and retake Quebec, which the English had captured the previous year.

Amherst responded to this news by ordering Major Robert Rogers to lead some 275 rangers and 25 British regulars past Colonel Louis-Antoine de Bougainville's garrison at Île-aux-Noix to attack the depleted Fort St.-Jean and Fort Chambly on the Richelieu River and there destroy French supplies and the bateaux used to convey them. Amherst expected such an operation to deplete French resources that might be used to impede his own advance. He also hoped to cause Lévis to detach units from his force moving on Brigadier General James Murray at Quebec.

Rogers departed Crown Point on Lake Champlain in bateaux in early June. He sent 50 of his men to Missisquoi Bay with orders to

destroy a French post on the Yamaska River west of the Richelieu. He also sent four Rangers to travel overland with dispatches for Murray at Quebec. The remainder of the rangers landed near the Chazy River.

Bougainville's alert patrols detected Rogers's arrival. In response, he sent out about 350 French troops, Canadian militia, and natives under Pierre Pépin dit La Force to intercept the English. On June 6, the French attacked Rogers's men, but Rogers succeeded in working part of his force around the French to strike them from the rear while he led the remainder of his men against the French from the front. This counterattack turned the tide and drove off the French. The French sustained as many as 40 casualties, with La Force among the wounded. The rangers had 14 dead and 10 wounded.

Rogers then regrouped his force on nearby Isle La Motte, where he was reinforced by Stockbridge Native Americans. On June 9, the rangers again set out, moving parallel to and west of the Richelieu to Fort St. John. There his force was detected and fired on, and Rogers decided that the French post was too strong to assault. He then moved on to Sainte Thérèse, the French transshipment point for supplies moving from Chambly by road, where they were again placed in bateaux.

The rangers arrived undetected, and early on June 16, taking advantage of a haycart moving through the gates, Rogers and his men rushed the fort and captured 24 soldiers without a shot being fired. At the same time, the bulk of the rangers made prisoners of another 78 French soldiers and civilians. Rogers then ordered anything of value to the enemy, including supplies, bateaux, wagons, and livestock burned or destroyed. He set the women and children free on the road to Montreal. Because several Frenchmen had escaped and undoubtedly warned the garrison at Chambly, Rogers abandoned plans to assault that place as well.

Following interrogation of the prisoners, Rogers withdrew overland to Lake Champlain by a route east of the Richelieu. On June 20 they were attacked by a force of 800 Canadians sent by Bougainville against them. Rogers's men managed to drive off the French, reach their waiting bateaux, and return to Crown Point.

Although the raid had not accomplished as much as Amherst and Rogers had hoped, it was undoubtedly a success. The rangers had destroyed valuable French supplies and transports, learned the strength of French garrisons in the vicinity and at Montreal, and seriously impacted French morale.

Salmon Falls, Battle of

Event Date: March 17, 1690

Battle that resulted in the near destruction of the English colonial settlement of Salmon Falls, New Hampshire, on March 17, 1690, by combined French and native forces as part of a larger attack during King William's War (1689–1697). In early 1690, three native and French raiding parties departed Canada to strike the New York and New England frontiers. A mixed force of 50 Abenaki warriors and French troopsmen led by Captain Joseph-François Hertel de Rouville and Chief Hope Hood of the Androscoggins sought to attack English targets east of the Merrimack River.

On March 17, 1690, Hertel's force arrived outside Salmon Falls, a small village on the border of New Hampshire and Maine. The settlement's defenses consisted of a small stockaded fort with four bastions and two fortified houses. Finding no watch kept at the fortifications, Hertel's forces swarmed over Salmon Falls at daybreak. The English mounted a brief defense before surrendering. Some 30 inhabitants were killed and another 54 taken prisoner. The Abenakis and the French then plundered and burned approximately 20 undefended homes and their outbuildings and slaughtered hundreds of head of livestock.

English militia forces from nearby York, Portsmouth, and Cocheco pursued Hertel's raiders as they retreated, catching them near sunset about two miles above the fort. In a pitched skirmish that lasted until sunset, the English militia lost two dead and six or seven wounded. The French and natives lost only two dead and one captured while managing to carry off all of their prisoners.

The combined effect of the raid on Salmon Falls and the recent destruction of Schenectady, New York, and Falmouth, Maine (then part of Massachusetts), caused panic among settlers of the New York and New England frontiers. Many families in southern New Hampshire fled the region for the safety of larger towns to the south and east. Within weeks of the Salmon Falls debacle, French and native forces also mounted a successful attack against Fort Loyal (Maine), which they destroyed. Despite these major setbacks for the English, the disasters along the frontier spurred some intercolonial military cooperation, culminating in New England's attack on Acadia in 1690.

Saltcatchers Fort (South Carolina)

English post built in 1728, located in southeastern South Carolina approximately one mile east of the present-day town of Yamasee. Little is known of the physical appearance of the fort, but it is believed that it was stockaded. Saltcatchers Fort derived its name from the river it commanded, the Salkehatchie, which apparently was anglicized to "Saltcatcher." Between 1728 and 1731, the fort was garrisoned by Captain James McPherson's company of southern rangers.

The primary function of the garrison was to defend Beaufort to the east from Yamasee raiding parties. The rangers' territory ran from the Combahee River in the north to the Savannah River in the south. When Saltcatcher Fort's garrison transferred to Fort Prince George—Pelachacola in 1734, it leveled the old fort.

Samoset

Born: Unknown Died: Unknown

An Abenaki native from the southern coast of Maine, believed to be the first Native American with whom the Plymouth colonists interacted. Samoset's birth and death dates are unknown. On March 16, 1621, Samoset, who had recently traveled south from his home in Maine to the land of the Wampanoags, entered the Pilgrim settlement at Plymouth and stunned the newcomers by welcoming them in broken English. Samoset had learned the language from European fishermen who had fished the waters around Monhegan Island off the coast of Maine.

Edward Winslow, the future governor of the colony, described Samoset as "starke naked, only a leather about his waist, with a fringe about a span long, or a little more; he had a bow & 2 arrowes, the one headed, and the other unheaded; he was a tall straight man, the haire of his head blacke, long behind, only short before, none on his face at all." Far from taciturn, Samoset spent much of the day of their first encounter conversing with the colonists. He informed them of the

Samoset, a member of the Abenaki tribe, is believed to have been the first native to interact with the Pilgrims. (Library of Congress)

shipborne plague that was introduced to the area by English slave traders in 1616 that had wiped out the original inhabitants of the village of Patuxet—the land the colonists were currently inhabiting.

Documentation exists for three trips by Samoset to Plymouth. On his third visit, March 22, 1621, he was accompanied by Tisquantum (Squanto), the last surviving member of the village of Patuxet. Kidnapped in 1614 by an English sea captain and subsequently sold into slavery, Squanto was absent when the deadly diseases swept through Patuxet. Having escaped the bonds of slavery in Spain, Squanto fled to England, where he learned English and was befriended by John Slaney, a wealthy English merchant who facilitated Squanto's return to his homeland.

Whereas Samoset's command of the English language was limited—often tainted by the use of fishermen's jargon—that of Squanto was not. Samoset's introduction of Squanto to the Plymouth colonists gave both the Wampanoags and the colonists a capable translator who would aid in establishing harmonious relations between the two peoples in the coming years.

San Antonio (Texas)

Spanish settlement located along the San Antonio River in south-central Texas. Colonial San Antonio began as a halfway point between Spanish settlements in East Texas and those in northern Mexico. The Spanish hoped that a settlement along the San Antonio River would also dissuade the French from attempting any new colonization efforts in Texas. The settlement further served as the center of defensive operations between Texas' western settlements and those to the east.

Impressed by the land and the availability of water for drinking and irrigation, Spanish friars founded the mission of San Antonio de Valero in 1718. Other missions in the immediate locality included Concepcion, San José, San Juan Capistrano, and San Francisco de la Espada. All of the missions were within a 12-mile radius of San Antonio de Valero, later known as the Alamo. The town of San Antonio itself grew from two major sites on the San Antonio River. One site included the Presidio San Antonio de Béxar, which the Spanish established on the opposite side of the river from the mission of San Antonio de Valero. The other site that shaped much of early San Antonio's growth was the villa of San Fernando de Béxar. Chartered in 1731 by settlers from the Canary Islands, the villa incorporated some families that had previously lived around the presidio. The idea of settling Canary Islanders in and around the new mission and presidio was to bolster the defenses of the region with more manpower.

From its inception, San Antonio served as a vital way station for East Texas settlements. And it was a strategic staging center from which the Spanish could launch attacks against French and Native American raiders. When military engagements between France and Spain in Europe spilled over into their colonies, San Antonio's position as the bastion of the defense of Texas grew in importance. After 1718, when French raiders forced the evacuation of missions and presidios in East Texas, San Antonio served as a beacon to the exiles. It was the launching site for Spanish efforts to retake the evacuated settlements, reassert Spanish control over eastern Texas, and force the French raiders back into Louisiana until hostilities ended in 1721.

Aside from serving as a vital supply station between eastern Texas and northern Mexico, San Antonio was a crucial outpost in the defense of settlers and missions from native incursions. Apaches were plentiful in the area at the time because they had been hard pressed from the north by other natives, most notably the Comanches. They frequently attacked the outlying families and ranches. As San Antonio expanded, the livestock herds of the settlers grew, providing enticing targets for Apaches. Unguarded transport routes from northern Mexico to San Antonio also invited raids by enemy natives.

The contingent of soldiers in San Antonio was never very large during the colonial period. At one point, in 1727, it consisted of 54 men. However, that number was reduced by 10 in 1729. The limited number of soldiers seriously hampered Spanish efforts to ward off hostile natives. As a result, helping the soldiers on their campaigns against and in defense from the Apache occupied a large part of the settlers' time. The Spanish citizens had little time to concentrate their efforts on crops and cattle, nor did they have time to build the town's infrastructure. These limitations hindered San Antonio's growth until the 1770s.

Sandusky Bay (Ohio)

Bay located in modern-day northern Ohio, along the southwest portion of Lake Erie at the mouth of the Sandusky River. The first recorded people in the area were from the Erie tribe, who were, however, driven away by the Iroquois in 1655. The bay region was later occupied by the Ottawas and the Wyandots.

In 1669, the French explorer Louis Jolliet followed the water routes used by the Native Americans in the area. Fur traders followed in his wake as they developed the area, built settlements, and cultivated strong relationships with the native peoples. English traders first made their appearance in the Ohio Country in 1699–1700.

After the 1713 Treaty of Utrecht, the territory officially became part of the French province of Louisiana, which extended from the Gulf Coast to the Great Lakes. However, a band of Wyandots in the Sandusky Bay region permitted the English to establish a fort on the north side of the bay, which endured for just a year. Be that as it may, English traders established lucrative trading posts in the area. The French erected a post nearby in 1754, but abandoned it five years later. The principal British claims to the region were the treaties of purchase from the Iroquois Confederacy. The growing confrontation between France and Great Britain finally came to a head in 1754 with the onset of the French and Indian War (1754–1763). France maintained control over the territory between the Ohio River and the Great Lakes until the Treaty of Paris in 1763, when it gave up all claims to the region by ceding Canada and the Ohio Valley to Great Britain.

Santa Elena (South Carolina)

Spanish colony established in 1566 on what is now Parris Island, South Carolina. The Spanish founded Santa Elena (Saint Helen) a year after they established the military post of St. Augustine, just south of Santa Elena in northeastern Florida. Santa Elena served briefly as the capital of Spanish Florida and was one of the earliest established European colonies north of Mexico.

Although Spaniards had explored the Carolina coastline as early as 1514, French explorers were the first to visit the area. In 1562, Captain Jean Ribault and a band of French Huguenots entered the sound that he named Port Royal. When Ribault returned to France for additional supplies and reinforcements, his soldiers promptly abandoned what they had called the Charlesfort settlement. It had been little more than a small earth and log fort. Four years later, in 1566, the Spanish moved in and built Fort San Felipe over the ruins of Charlesfort. The Spanish called the new settlement Santa Elena, and it became the capital of their La Florida province.

Attempting to gain a stronger foothold in North America, the Spanish erected a number of forts around Santa Elena. In 1566, they constructed Fort San Salvador, followed by a larger Fort San Felipe to replace the earlier one. Fort San Felipe lasted from 1566 to 1570.

In 1570, the fort had to be rebuilt because of a powder magazine explosion. The new Fort San Felipe was on higher ground and was rectangular in shape with a moat. In 1576, Native Americans destroyed the fort and the entire settlement. The following year, the Spanish rebuilt the town, along with a new triangular fort, called Fort San Marcos. In 1583, Fort San Marcos was rebuilt and reinforced to protect the settlement from attacks by the local natives as well as possible English encroachments. In 1586, a raiding party of Native Americans leveled Santa Elena, whose surviving inhabitants retreated to St. Augustine.

The Spanish destroyed Fort San Marcos and abandoned the settlement in 1587, deciding to concentrate their forces in and around St. Augustine. The territory once again was left to the Native Americans. After 1670, the English established a foothold in the region, which would eventually become South Carolina. Because of its warm climate, plentiful water supplies, and rich soil, coastal South Carolina developed an important plantation economy. This brought not only great wealth to the area, but also slavery.

Saponis

American Indian people of the mid-Atlantic region of North America. The word "Saponi" is evidently a corruption of the word "Monasiccapano" or "Monasukapanough," signifying "shallow water." The Saponis belonged to the Sioux linguistic family, their closest relations being the Tutelos. At the time of European colonization, the Saponis and Tutelos probably numbered only about 2,700 people.

The Saponis lived in central and southwestern Virginia. A Saponi village site has been identified near present-day Charlottesville. Their principal settlement, bearing the tribe's name, may have been near present-day Lynchburg. The Saponis seem to have been constantly on the move in order to escape their enemies. By the 1670s, the Saponis and the Tutelos had moved to avoid attack by the Iroquois and then lived on islands in the Roanoke River in present-day Mecklenburg County. By the beginning of the 18th century they had moved again to lands along the Yadkin River near present-day Salisbury, North Carolina. Prior to the Tuscarora War of 1711, the Saponis had established themselves near present-day Windsor, North Carolina.

Although the Saponis sought incorporation with other native groups, including the Tutelos, Occaneechis, and the Stakanox, they still feared attack from larger tribes and so sought the status of "tributary Indians," living under the protection of colonial settlements. Gov. Alexander Spotswood of Virginia listed them as such in 1712.

Spotswood planned to settle the Saponis and other small native groups on the Virginia frontier, where they might help protect colonial settlements. By 1715, the Saponis had moved to Fort Christanna and there were incorporated with the Oconeechis, the Stakunox, and the Totteros. These splinter groups were joined by the Enos and Saraws, who also sought protection. While at Fort Christanna, all of the natives who settled there, no matter their tribal affiliation, were called Saponis. In 1716, one visitor identified 200 Saponis at Fort Christanna.

In the Treaty of Albany of 1722, the Iroquois agreed to halt their incursions into Virginia, whereupon some Saponis moved both north into Pennsylvania and south into North Carolina. The latter group incorporated with the Catawbas. At that point, they disappeared as a distinct tribal entity, although there is a small community known as the Hallowa-Saponi in North Carolina, and others live among the Iroquois. The name is preserved by the small town of Sapona, in Davidson County, North Carolina, east of the Yadkin River.

Saratoga, Battle of

Event Date: November 17, 1745

An engagement during King George's War (1744–1748) in which a French and Native American raiding expedition struck Saratoga, New York, on November 17, 1745. In June 1745, the New England militia, with the support of the British Royal Navy, secured the most celebrated triumph of the war to date when they captured the French fortress of Louisbourg. That bastion had threatened the security of English colonial shipping.

With the bulk of colonial militia absent from New York as a consequence of the Louisbourg expedition, the French and their Native American allies seized the opportunity to raid central New York. Their raids persisted throughout the summer. Bent on retaliation, English settlers and their native allies launched counterraids, which were mostly ineffectual. Indeed, they served only to incite the French to increase the intensity of their attacks.

In the fall of 1745, the French prepared for their deepest foray yet—to Saratoga and eventually to Albany. The French expedition, led by Lieutenant Paul Marin, set out from Montreal in the late fall, intending to devastate the settlements of the Connecticut Valley. Marin's force numbered more than 520 men, including officers, cadets, French colonials, Iroquois, Nipissings, Hurons, and Abenakis. On reaching the French fort at Crown Point, near the south end of Lake Champlain, the raiding party encountered a Jesuit priest, Father Piquet. At the suggestion of Piquet, Marin set a new course for the expedition, choosing an advance toward Albany, in the hopes of inhibiting the encroachment of English settlements from that direction.

The war party moved down the Hudson River Valley cautiously, but it encountered no resistance. After the capture of a trading outpost, Marin became convinced that the locals did not suspect the presence of his force. Thus, he sped up his advance to Saratoga, a thriving agricultural settlement some 30 miles north of Albany.

Saratoga sat at the junction of Fish Creek and the Hudson River, and most of the inhabitants were tenants of Philip Schuyler, who owned mills and a large estate there. On November 17, well before daybreak, Marin's raiders surged down the road to Saratoga with the native contingent in the lead. Surprise was complete, most likely because the town's militia garrison had been recalled because the New York Assembly considered the fiscal burden for upkeep of the barracks too high.

Saratoga suffered complete devastation. Marin's men smashed doors and windows, forced their way into dwellings, and hauled the residents outside. The French set fire to every structure they

encountered. Schuyler was among some 30 English dead, some of whom fell victim to the flames engulfing their homes. After securing all the plunder they could carry, the French headed home, bringing with them 109 prisoners. The Battle of Saratoga was a stunning victory for the French, who lost not a single man.

Sassacus

Born: ca. 1560 Died: July 1637

Pequot leader and key figure in the Pequot War (1636–1637). Sassacus (meaning "the wild one"), the son of Pequot sachem Tatobem (Wopigwooit), was born about 1560 near present-day Groton, Connecticut. He lived in the palisaded town of Weinshaunks on the Thames River, where Groton is now located.

Sassacus fought in many campaigns against neighboring tribes, during which the Pequots expanded their dominion from Rhode Island west to the Hudson River Valley, and subordinated the Montauks on Long Island. He earned a reputation as a great warrior and was said to have killed a large number of enemies in battle. His fellow Pequots bestowed on him great honors for his fighting abilities, believing that he possessed supernatural powers. The Pequots' Narragansett enemies considered Sassacus to be virtually divine and very much feared him.

In 1632, on his father's death at the hands of the Dutch, Sassacus assumed leadership of the 26 towns of the Pequot Nation. When New England officials wrongly accused the Pequots of murdering several traders in 1636, Sassacus refused to submit to the colonists' demands. The New Englanders responded by invading Pequot territory in company with their Narragansett and Mohegan allies. Sassacus led the Pequot resistance in what became known as the Pequot War (1636–1638) and was in command of a war party searching for colonial forces when New England troops destroyed the Pequots' Mystic Fort in May 1637, killing hundreds of natives.

Although the carnage convinced many Pequots to surrender, Sassacus continued to resist, and he traveled to Mohawk territory with several warriors in an effort to win that tribe's assistance. Instead of assisting the Pequots, however, the Mohawks killed Sassacus, probably in July 1637, and delivered his scalp to the governor of Massachusetts. Sassacus's death ended the possibility of any

further Pequot resistance and ensured the colonists' complete victory in the Pequot War.

Sauks and Fox

Two closely allied Native American groups in the western Great Lakes region that banded together in response to attacks by other native groups from the eastern Great Lakes and French attempts to exterminate the Fox. The Sauks and Fox were two distinct but related tribes that spoke two different dialects of the same Algonquian language. Both peoples originated somewhere in the western Great Lakes. The Sauks and Fox were related to the Mascoutens and Kickapoos, with whom they periodically maintained military alliances. At the time the French first made contact with them, the Sauks occupied upper Wisconsin. The Fox lived in central Wisconsin. There is some evidence that both groups may have lived in Michigan prior to 1600 and were driven out of that area by Iroquoin or Huron raids.

In the early 1600s, the Sauks and Fox secured Wisconsin for themselves by defeating the Winnebagos in a brief conflict. By the end of the 17th century, the Sauks had hesitantly accepted Jesuit missionaries among them. However, the Fox refused to allow the outsiders into their midst. In the early 18th century, the Fox fought two wars with the French, one in 1712–1716 and another in 1728–1737. During both conflicts, the French attempted to exterminate the Fox. Finally, in 1734, the Fox took refuge with the Sauks, and both groups moved to Iowa in 1735 to put distance between themselves and the French. In 1766, both groups moved back to Wisconsin only to return to Iowa by the end of the century.

In the 19th century, the U.S. government removed both groups to Indian Territory in Kansas and Oklahoma. This occurred after the Black Hawk War in which a number of Sauks fought the U.S. Army in Illinois. Today, Sauks and Fox can still be found in Oklahoma, Missouri, Kansas, Iowa, and Illinois. Most live in Oklahoma, however.

Scalp Bounty

Remuneration paid by colonial governments for enemy scalps. During the 17th century, colonial governments adopted the practice of rewarding with bounties individuals who returned from combat with the scalps of their opponents. As early as 1616, Span-

ish authorities had relied on head bounties to suppress an indigenous insurrection in Durango. In 1637, the English colony of Connecticut was the first to adopt a similar policy, promising goods to allied Mohegans who would bring back Pequot heads (or scalps; the records are ambiguous). The Dutch in New Amsterdam followed suit four years later, offering bounties for the heads of Raritans.

It is not until 1675, however, that we find the first unequivocal reference to scalp bounties. Then, during King Philip's War (1675–1676), New England authorities offered such rewards to both Narragansett warriors and white settlers. By 1692, New France also began to pay their native allies for enemy scalps. It was around this period, within the context of King William's War (1689–1697), that bounty policies that had originally rewarded only the scalping of hostile natives were extended to include the scalping of enemy colonists.

Both the French and the British infamously continued to offer scalp bounties intermittently until the end of their struggle in North America. However, there existed rather important differences in their respective policies. On the one hand, bounties in the Anglo-American colonies were primarily aimed at soldiers and colonists, providing them with an incentive to risk their lives in the pursuit of hostile natives. Each colonial government promulgated and abrogated its own scalp acts. The amounts promised fluctuated widely according to available financial resources, the degree of perceived threat, the age and gender of the victim, and the status of the scalp taker. On the other hand, French colonial authorities made no distinction as to age and gender. And they extended their offer of scalp bounties only to native allies, as a means of subsidizing war parties. Furthermore, the value of the trade goods offered by the French remained surprisingly stable throughout the period (around 30 *livres* per scalp). French bounties dipped only in the few years that preceded the capitulation of New France.

The strongest opposition to such bounties generally came from one's colonial adversary. Indeed, French and English governors mutually accused the other of having been the first to promote by this dubious means the savage murder of seemingly innocent white Christians. Because the survival of colonists and of empires was believed to be at stake, however, moral misgivings were few. It is quite telling, for example, that several Puritan ministers joined scalping parties or that some French missionaries are known to have served as intermediaries in the payment of bounties.

That the newcomers manipulated an indigenous practice leaves no doubt. Yet it remains unclear what repercussions bounties may have had on the customs and values of native warriors. Although Anglo-American colonists transformed scalping into a profit-making exercise, it can be argued that native warriors in fact understood bounties within a relatively traditional context of reciprocal gift exchanges.

Scalping

The practice of removing the skin—or scalp—from an enemy's skull with the hair still attached. In the early modern imagination, no act of violence typified the brutal nature of North American warfare more aptly than scalping. Although generally performed on the bodies of those who had been killed, the operation in itself was not fatal. Occasionally, a lucky victim left for dead and scalped on the battlefield survived to tell of his or her experience. If the bone tissue regenerated properly, which was not always the case, a scalping victim could live a long and productive life.

Contemporary illustration showing a Native American holding a scalp. Both Native Americans and European colonists participated in the practice of scalping, with scalps used to determine bounties. (Library of Congress)

Although there have been allegations that scalping originated with European newcomers, archaeological evidence has firmly established that the custom was widely practiced among the indigenous peoples of the Americas during the pre-Columbian period. The earliest reference to scalping in the historical record can be found in the writings of the French explorer Jacques Cartier. During his 1535 voyage to the St. Lawrence River Valley, the Iroquoian inhabitants of Stadacona proudly displayed "the skins of five men's heads, stretched on hoops, like parchment." They were prizes that had been taken from their Micmac enemies. Spanish explorers encountered similar practices around the same period in what is today the southeastern United States. The renewed French, English, and Dutch explorations of the early 17th century produced additional reports of scalping among most, if not all, of the native peoples of the eastern North American woodlands.

It is clear that the act of scalping had profound meaning in Native American thought. A substitute for decapitation, it secured not only a physical victory but also a spiritual one over an opponent. Though the highly ritualized integration of the scalp within local belief systems varied from one native group to the next, the basic elements seem universal. A warrior cried out immediately after removing a scalp, and likewise he sung a special song when he returned to his village. The flayed skins were then stretched on hoops and dried. They were often carefully painted and decorated, later to be used in dances and ceremonies. They could also be worn about the body and displayed in cabins and on palisades.

To appreciate the significance of scalping, one must understand that the head, and by extension its skin, was widely believed in indigenous cultures to be a repository of vital energy. Accordingly, the scalp was much more than a mere war trophy—it was the embodiment of the victim. It thus served as an acceptable substitute for a living captive, and could be a replacement for a dead relative.

Contemporary observers conditioned by European notions of war, as well as later historians, persisted in viewing the custom of scalping as a testament to the cruel and barbaric nature of American Indians. Yet beginning in the late 17th century, many colonists took up the practice themselves. And colonial governments resolved to subsidize the practice by offering scalp bounties. Not surprisingly, the complex indigenous cultural meanings were lost on the newcomers. From their perspective, a scalp offered little more than evidence that an enemy had been killed.

Schenectady, Battle of Event Date: February 9, 1690

One of the first battles of King William's War (1689–1697), it featured a French-led attack against the English frontier town of Schenectady, New York, on February 9, 1690. This French and Native American attack, part of a series of raids along the English frontier, marked the first major French offensive against the English settlements. It was part of a highly effective strategy that forced English colonial governments to allocate scarce manpower to defend the frontiers.

Schenectady, situated along the Mohawk River, was a trading and farming community roughly 15 miles northwest of Albany. Schenectady's inhabitants had feared French attacks throughout the 1680s because of the close relationship they enjoyed with the Iroquois Confederation and its ongoing skirmishes with New

French forces and allied Abenaki Native Americans shown attacking Schenectady, New York, on February 9, 1690. This attack, which destroyed the English town, was one of the first such actions of King William's War (1689–1697). (North Wind Picture Archives)

France. The colony of New York began fortifying its frontier towns, including Schenectady, in 1687. A log stockade enclosed the town of slightly more than 200 inhabitants and at least 50 dwellings. A blockhouse further strengthened the defenses. With the outbreak of King William's War in 1689, the town received a contingent of 24 Connecticut militiamen drawn from Albany's stronger garrison.

The French had contemplated attacking the New York frontier throughout the 1680s, although none of their plans came to pass. Governor General Louis de Buade, Comte de Frontenac, had planned a major strike against the entire Hudson River Valley region to take advantage of the political divisions engendered by Leisler's Rebellion (1689–1691). Lacking sufficient manpower, however, he scaled back operations to three major raids against the New England and New York frontiers.

Frontenac wanted to strike at Albany, a major fur-trading center, but this well-defended post required more forces than he could muster and he chose Schenectady instead. In addition to the goal of spreading fear along the frontier, the raid was in retaliation for an attack on August 5, 1689, by Iroquois warriors at Lachine, outside Montreal. That assault had killed more than 20 people, and another 60 had been taken captive.

In Montreal in January 1690, the French gathered nearly 160 Canadians, including French colonial troops, *coureurs de bois* (independent fur traders), and 100 Christianized natives, mostly Mohawks. Lieutenant Nicholas D'Ailleboust de Manthet commanded the force, assisted by Lieutenant Jacques Lemoyne de Sainte

Holere and his brother, Lieutenant Pierre Le Moyne d'Iberville. The Mohawk leader Kryn led the Native American contingent.

From Montreal the attackers followed the Richelieu River southward to Lake Champlain and down the ice to Lake George. A short portage brought them to the Hudson River Valley, above Albany. The 200-plus-mile winter trek took its toll, however. Only 114 Canadians and 96 natives completed the trip.

The attackers arrived in the early evening of February 8, 1690, in the midst of a blizzard. Confident that an attack was unlikely in such inclement weather, the town garrison hunkered down in the blockhouse without posting guards. Popular accounts depict the town's north gate guarded only by snowmen. De Manthet planned to attack through both the north and south gates simultaneously. But the second force, led by d'Iberville, could not locate the south gate in the heavy snow and darkness. Finding no guards and the north gate inexplicably open, the raiders crept into the stockade and surrounded most of the houses.

The actual attack began after midnight on February 9. It caught the garrison and the townspeople completely by surprise. Anyone who resisted was slain. The attack's swift nature limited the town's defense to a few isolated pockets of resistance.

Within two hours the attackers controlled the town. They then systematically pillaged and burned it, destroying nearly every structure. Sixty inhabitants, including 9 of the garrison, lay dead. Probably an equal number had been captured, although the raiders carried off only 27 captives. Some townspeople escaped through the south gate, alerting the authorities in Albany. After dawn, De Manthet's men loaded their plunder on captured horse-drawn sleds and returned northward with their captives, leaving some 50 survivors amid the smoking ruins.

Schenectady's destruction, along with later French raids in New Hampshire and Maine, shocked not just New York but also all the northern English colonists. Retaliation was far from swift, although a party of militiamen and pro-English Mohawks pursued the attackers, picking off some stragglers. Most of the raid's survivors, meanwhile, fled to Albany. New York's government debated abandoning Schenectady, but soon decided to rebuild the fort, encouraged survivors to return, and recruited new settlers. Of the 27 captives taken, 18 either escaped, were ransomed, or were returned at war's end.

Schuyler, Peter

Born: September 17, 1657 Died: February 19, 1724

Trader, soldier, colonial official of New York, and noted frontier diplomat. Born in Albany, New York, on September 17, 1657, Peter (Pieter) Schuyler was the son of fur trader and pioneer Philip Pieterse Schuyler. Schuyler may have attended a secondary school in Albany, but it is likely that most of his education was of the practical variety, gained through lengthy contact with traders, soldiers, and public officials. By the time he was in his mid-20s, Schuyler was a cavalry lieutenant in the Albany Militia and was associated with prominent fur traders.

In 1686, Gov. Thomas Dongan of New York granted Albany the so-called Dongan Charter, its official municipal charter. Dongan then named Schuyler the settlement's first mayor. In addition to his mayoral duties, Schuyler headed the board charged with dealing with the Native Americans. Given the name of "Quidor" (brother) by the local Native Americans, Schuyler attended many conferences as head of the board of commissioners for native affairs. Schuyler maintained a working relationship between the native and settler cultures. To combat the growing French threat in the 1680s, the commissioners attempted to create an alliance with the Iroquois. After talks failed, Schuyler and other Albany officials solidified Native American neutrality, commonly called the Covenant Chain.

Peter Schuyler, the first mayor of Albany, New York, and head of the commission that dealt with Native Americans. (Courtesy of Rutgers University Libraries, Special Collections & Archives)

Schuyler was forced out of his position as mayor in 1689 during Leisler's Rebellion. However, the citizens of Albany did not recognize the Leisler-sponsored government, and Schuyler set up office on the outskirts of town. In February 1690, during King William's War (1689–1697), the French and their native allies burned Schenectady and massacred much of its population. At that point, Leisler's commissioners reinstated Schuyler and other officers to avenge the massacre. By March 1691, Schuyler had resumed his full duties as mayor of Albany after Leisler had been tried, convicted, and executed. Schuyler remained in that post until 1694.

In August 1691, Schuyler, then a militia colonel, led 266 Albany militiamen and 146 Mohawk and Mahican warriors to raid the French settlement at La Prairie. The attack was less than successful, and Schuyler's force returned to Albany having suffered heavy casualties. Two years later, Schuyler revenged this event by a thorough rout of French forces near Schenectady.

In 1692, Schuyler joined the Government Council and in 1698 was dispatched to Canada to announce the terms of the Treaty of Ryswick (September 30, 1697). His primary mission, however, was to exchange paroled French prisoners, who accompanied him, for English prisoners held in Canada. Between the British expeditions against Canada in 1709 and 1711 associated with Queen Anne's War (1702–1713), Schuyler escorted four Mohawk chiefs to England as emissaries to Queen Anne. On his return to New York, Schuyler continued his service on the board of commissioners and on the Government Council. He also spent considerable time overseeing his growing land grants.

Schuyler was three times acting governor of New York (briefly in both 1701 and 1709 and then from July 1719 to September 1720). He ran afoul of political maneuvering and was dismissed from the council in 1720. Schuyler died in Albany on February 19, 1724, having spent almost 40 years in public service helping to cement friendly relations with the Native Americans.

Scout

Individuals or small units assigned to reconnaissance and pathfinding duties in advance of armies. Scouts were often lightly armed cavalry or infantry under orders to avoid combat engagements and gather intelligence for military commanders. Occasionally, scout units incorporate individuals from the region of operations to serve as native guides for the area.

Scouts should not be confused with spies, who operate in a clandestine manner to obtain information. Scouts seek to elude the enemy but are identifiable by the wearing of uniforms and by openly bearing arms. Their primary purpose incorporates not only gathering accurate information about terrain, enemy strength, and resources but also transmitting that information to superiors.

In the colonial period, Native American scouts were particularly prized by European regular and colonial forces because they were perceived as exceptional woodsmen and trackers. From the earliest Dutch, English, and French settlements, colonists cultivated relationships with natives for trade and defense. Europeans exploited intertribal rivalries to gain allies in the New World. In almost every war involving colonial forces, native allies supplied troops, especially scout forces. One of the earliest examples of the importance of native scouts came during the Second Anglo-Powhatan War (1622-1632) in Virginia. In March 1622, Virginia colonists were surprised by a native force that killed over 300 settlers and drove the remainder into a handful of locations on the lower James River. For the next 10 years, the colonists fought to survive, and scouts played a vital role. Rather than relying on a strategy of defensive warfare, colonial scouts sought out the supply locations of enemy natives, allowing the numerically inferior but better-armed Virginia Militia to destroy the food supplies of their enemies. In the Third Anglo-Powhatan War (1644-1646), the strategy of scouting supplies and attacking the infrastructure of native society was used to devastating effect.

In New England, conflict between colonists and Native Americans also clearly illustrated the value of scouts to colonial warfare. During the Pequot War (1636–1638), Narragansetts allied with English colonists led a New England war party of militiamen to a Pequot fort on the Mystic River in May 1637. The use of native scouts allowed the colonists to surround the hidden fort in the predawn darkness and launch a ferocious surprise attack. Soon thereafter, the Pequot Nation sued for peace. During King Philip's War (1675–1676), New England faced a confederation of tribes allied under Metacom, sachem of the Wampanoags. The natives launched a withering series of frontier raids but withdrew before militia forces could retaliate. The lack of native allies forced the colonists to fight a war of attrition against their elusive enemy.

In colonies farther south, settlers in Virginia and the Carolinas used native scouts whenever possible during a series of frontier wars against regional tribes. The necessity of Native American assistance became grimly evident during Bacon's Rebellion (1676–1677), in which a group of Virginia and Maryland militiamen led by Nathaniel Bacon sought to destroy all regional natives in spite of diplomatic efforts by the Virginia governor. By attacking Susquehannocks as well as the hostile Doegs, Bacon's forces provoked a series of retaliatory raids on frontier towns. Bacon's

frontier fighters demonstrated that some colonists had become every bit as effective as natives in the hinterlands. During the Tuscarora War (1711–1713) and the Yamasee War (1715–1717), the settlers of the Carolinas employed native scouts to assist in the decimation of the most powerful tribes in the region, capturing or exiling the vast majority of each tribe.

In King William's War (1689–1697), French and English colonists, both using native allies, launched a series of raids against each other along the northern frontier. Native allies assisted both sides, particularly by providing scouts. The raiding system of warfare relied on extensive reconnoitering of enemy positions to avoid the possibility of an ambush. In Queen Anne's War (1702–1713), the frontier raids were renewed, as neither the French nor the English had the resources or the will for a sustained attempt at conquest. Likewise, in the Anglo-Spanish War (1739–1744) and in King George's War (1744–1748), border skirmishes between the French and English colonists of North America characterized much of the fighting.

During the French and Indian War (1754–1763), the use of native and provincial scouts in support of regular troops reached a new level of effectiveness. The French received excellent scouting reports from native allies in the vicinity of Fort Duquesne, allowing them to repel Major General Edward Braddock's larger assault force in 1755. Braddock, leading 2,200 regulars and provincials, was ambushed by only 800 French and Native Americans, but was decisively defeated. Undoubtedly the most famous colonial scout of the era was Robert Rogers, a New Hampshire frontier farmer who trained and led a company of provincial rangers during the war. Calling themselves Rogers' Rangers, they demonstrated their importance by scouting in the vicinity of Fort Ticonderoga and Crown Point, New York, providing invaluable information for the successful British advances on each position. Rogers developed a set of 28 rules for his forces, detailing the best methods of reconnaissance for small parties. His "Plan of Discipline" still stands as the basis for scout training in the U. S. military.

Scurvy

A disease caused by lack of vitamin C, a substance the human body is incapable of manufacturing and that must be obtained from the diet. Most of scurvy's manifestations are a result of impaired collagen synthesis. This leads to weakness in the walls of small blood vessels and subsequent rupture of those vessels and bleeding, particularly under the skin and mucous membranes. That in turn leads to bruising, pain in the joints and muscles, bleeding in the lungs and bowel, and the ulceration and bleeding from the gums that were the disease's hallmark. If untreated, patients with scurvy become anemic and lethargic and ultimately descend into delirium, coma, and death. The entire sequence can be prevented or reversed with only one gram a day of ascorbic acid (vitamin C), a chemical found in fresh fruits and vegetables, especially citrus fruits.

Although scurvy had been a problem for armies on long deployments since antiquity, it became a major concern only with the development of navigation techniques that allowed for long sea voyages out of sight of land. It was relatively easy to preserve meats and carbohydrates for long periods. However, it was very difficult to carry fruits or vegetables during the first 300 years of transoceanic exploration. During Sir Francis Drake's 1585 circumnavigation of the globe, almost one of every eight men in his crew died of scurvy within three months of leaving England. Commodore George Anson's voyage around the world between 1740 and 1744 was particularly infamous; 1,050 of the 1,955 men who departed England with him died of scurvy, even though Anson's personal log noted that some of the men improved for a time after eating oranges in Tahiti.

In fact, the East India Company had noted as early as 1600 that one of its crews fed lemons and oranges remained free of scurvy. But it remained for British naval surgeon James Lind (1716–1794) to do a controlled experiment in which he divided 12 sailors into six groups, each of which was given a different treatment reputed to be of benefit in treating scurvy. Only the group given lemons and limes improved, and that group was cured entirely.

These findings were questioned by most naval surgeons (and even by Lind himself who continued to believe that "good air" was as important as the citrus fruits), and routine use of lemons or limes was not standard in the British Navy until 1795. In that year, Sir Gilbert Blaine convinced First Lord of the Admiralty Earl Spencer to mandate their use. West Indian limes, which replaced the more expensive lemons and oranges, made the blockade of Napoleonic France possible and gave the British sailors the nickname "limey."

Seigneurial System

A feudalistic system of land distribution established in New France in 1627. Although technically applicable to all of France's North American colonies, the seigneurial system functioned only within the St. Lawrence River Valley (Quebec) settlements. Approximately 200 seigneuries were granted during the French regime, and by 1760, about 75–80 percent of the population lived in seigneuries. With the cession of the colony to Great Britain in 1763, the British maintained French institutions under the terms of the 1774 Quebec Act and the 1791 Constitution Act. The system was finally abolished in 1854.

This legal system of land distribution established a familiar framework for colonial settlement. The Crown created a series of rights and obligations between the *seigneur* (lord) and the *censitaires* (tenants or habitants) when it granted a section of land to the *seigneur*, who then divided it among settlers. Companies, individuals, and religious orders acted as *seigneurs*. The settlers did not own the land; however, they could do what they wanted with it provided they met a series of obligations that included a *corvée* (tax payable by labor), a rent, a *banalité* (tax on grain), *lods et ventes* (a tax on the transfer of the property), and *cens* (a tithe). *Seigneurs* in

turn could establish courts and grist mills as well as grant licenses for hunting, fishing, and woodcutting.

The distinctive pattern of seigneurial land distribution in New France began in earnest in the 1630s, when Robert Giffard began assigning land. Farms fronted the St. Lawrence River and stretched inland. A second tier—or ring—of land would then be established inland with lots fronting a road. This gave settlers access to a variety of land types and the main transportation artery, and it also allowed for interaction with neighbors. This arrangement also served as an inexpensive and rapid means of surveying. Settlement patterns created by the seignuerial system of land distribution can still be seen in the St. Lawrence River Valley in the modern-day Canadian province of Quebec.

Senecas

One of the five Iroquois nations comprising the original Iroquois Confederation. The Senecas were among the most aggressive members of the confederation during the colonial period. They actively participated in wars against the French and their Algonquian allies in Canada, especially during the Beaver Wars (1641–1701).

The Iroquois styled themselves the "People of the Longhouse," and the Senecas were the "Keepers of the Western Door" of the confederation. The Senecas occupied the region from the Genesee River to Canandaigua Lake in western New York. Known in their own language as *O-non-dowa-gah* ("great hill people"), they were the largest in population of all Iroquois nations and remained so throughout the colonial period. Senecas made up perhaps half of the total Iroquois population and in the colonial period could place in the field upward of 1,000 warriors.

In the 1620s, trade with the Dutch allowed the Mohawks, the easternmost Iroquois nation, to obtain guns and metal weapons. They disseminated these through the confederation to the Senecas, who then carried them into war against their enemies to the north and west.

Beginning in the 1640s, the Iroquois Confederation attacked their Huron neighbors to the north in what became known as the Beaver Wars. Although the warfare had an economic component to it, it was also driven by the Iroquois need to reconstitute their population. Indeed, their population had been greatly reduced by epidemic disease over the previous two decades. To that end, the Iroquois conflict with the Hurons served also as a "mourning war," whereby enemy captives would be assimilated into Iroquois culture to replace the dead.

Whatever the cause of the Iroquois conflict with the Hurons, it was the Senecas who did the majority of the fighting. During the summer of 1648, Seneca war parties ravaged Huron towns, including the large fortified village of Taenaostaiae. Some 700 Hurons were killed or captured, and 1,000 others were forced to flee. Soon afterward, the Mohawks joined the Senecas, and together they killed or captured thousands of Hurons, driving survivors north and west of Lake Ontario before the Hurons finally stopped the Iroquois assault. Victorious but badly battered, the Senecas and the Mohawks decided to withdraw, leaving the Huron survivors to seek refuge among other tribes or flee farther west. Although the Hurons were not completely exterminated by the Iroquois, the political and economic entity that had been the Huron Nation ceased to exist.

Following the dispersal of the Hurons, the Senecas turned their attention to neighboring tribes on their western border. Beginning in 1651, the Senecas attacked a Native American group known as

Seneca chief Cornplanter. The Senecas constituted one of the five nations of the original Iroquois Confederacy. (Library of Congress)

the Neutrals, who occupied the Ontario peninsula. After some initial setbacks, the Senecas soon overcame the Neutrals, scattering or absorbing their entire population by 1653. An Iroquoian-speaking people known as the Eries were the next to face Seneca hostility. The Eries occupied desirable hunting grounds south of Lake Erie. In 1655 the Senecas, along with the Onondagas, attacked the Eries, dispersing and defeating them by 1657.

Following these victories, the Senecas, along with the Onondagas, the Oneidas, and the Cayugas reached a peace settlement with the French. These four western Iroquois nations, jealous of the Mohawk monopoly over trade with the Dutch at Albany, sought to replace the Hurons as the principal French trading partner. With their northern border secured, the Senecas then joined their Mohawk cousins in a war against the Susquehannocks, another Iroquoian-speaking people living in Pennsylvania and Maryland. But the Susquehannocks put up a fierce fight. And when Mohawk raids along the St. Lawrence River fractured the peace agreement with the French, the Senecas pulled their warriors back to their homelands along the Genesee River. The Senecas sought to maintain their alliance with the French, but peace proved fleeting.

Anxious to bring ever-greater quantities of furs to their new English partners at Albany, the Iroquois struck westward and attacked the American Indians of the Ohio Valley and the Ottawas north of the Great Lakes. The Ottawas were the main fur suppliers for the French, and retaliation from New France fell hard and swift on the Seneca. In 1687, some 2,000 French Canadians and Algonquins invaded Seneca homelands, destroying their villages, corn-

fields, and storehouses. Additional punitive raids followed. Finally, the Senecas, exhausted by two decades of war, joined the Onondagas in making peace with the French in 1701.

Over the next 50 years, the Senecas remained neutral, although they increasingly gravitated toward the French in part because of their dependence on French trade goods from Fort Niagara. During King George's War (1744–1748) and the French and Indian War (1754–1763), Seneca warriors, especially western Senecas in the upper Ohio Valley, often supported the French. Moreover, the Seneca attachment to the French did not immediately dissolve after the French withdrew from North America in 1763. Many Senecas joined Pontiac's Rebellion that same year, where they assisted in the capture of British forts in northwestern Pennsylvania. But the failure of the uprising and the removal of the French forced the Senecas to seek accommodation with the British. Their alliance was strained at best, although the Senecas remained true to their new ally, eventually siding with the British during the American Revolutionary War.

Senecas, French Attack on

Start Date: June 1687 End Date: 1687

French invasion of Iroquois territory during the Beaver Wars. The French alliance with the Hurons in the early 17th century brought the Quebec colonists into conflict with the Five Nations of the Iroquois, who were the Hurons' traditional enemies. When the Iroquois tried to expand their control of the fur trade in the Illinois region, challenging the French position there, Gov. Joseph-Antoine Le Febvre de La Barre pronounced the existing French-Iroquois peace treaty dissolved and marched against the Five Nations in 1684. However, by the time La Barre's force of 1,200

French soldiers and native allies reached the eastern end of Lake Ontario, supply shortages and disease had rendered them ineffective. Surrounded by the Onondagas, La Barre was forced to sign a rather humiliating treaty recognizing Iroquois rights to the Illinois trade and abandoning French support for their Native American allies in the area.

On learning of the treaty, King Louis XIV was incensed. He quickly dismissed La Barre and replaced him with Jacques-René de Brisay, Marquis de Denonville, a capable and well-tested soldier. Louis provided Denonville with 1,600 French troops and ordered the new governor to settle the Iroquois problem by any means necessary. Realizing that the English in New York were encouraging the Iroquois attacks and would urge the Five Nations not to negotiate, Denonville decided that force was required to end the Iroquois threat.

Denonville marched into Iroquois country in late June, 1687. A few Onondagas and Oneidas came to the French camp in an effort to negotiate, but Denonville captured them. He then marched into Seneca territory with a combined force of 2,000 French troops and native warriors. Most of the Senecas, including all the women and children, fled, but several hundred men stayed behind to defend their land. After a brief skirmish in which the Senecas suffered at least 20 dead and the French about half that many, the Senecas offered no further resistance. Denonville then proceeded to burn two large Seneca towns and two smaller villages, and destroyed all the stored provisions and crops that his soldiers could find, amounting to an estimated 1.2 million bushels of provisions. He correctly predicted that this loss of foodstuffs would cause the Senecas great distress. The French and their allies also desecrated and looted Seneca burial grounds.

When the Iroquois learned of the impending invasion, they had dispatched emissaries to Albany to seek English assistance, but received only a small amount of ammunition and some critical comments about their lack of courage. English officials later provided the Iroquois with additional arms and ammunition. The Iroquois launched retaliatory raids into New France during the next several months, until both sides agreed to open peace negotiations in the summer of 1688. The negotiations failed, however, and sporadic French-Iroquois warfare continued until the outbreak of King William's War in 1689 further intensified the strife.

Shawnees

An Algonquian-speaking Native American people whose name, *chawunagi*, means "southerners" in Algonquian. The name came from the fact that the Shawnees lived south of other Algonquians. Although the Shawnees are generally classified as natives of the northeastern woodlands, their migrations taught them to adopt the life ways of other Native Americans, especially those of the Southeast.

Although nomadic, the Shawnees in the warm months inhabited villages, around which they grew crops. Winter brought more scattered habitation patterns as small groups went out to hunt. The Shawnees moved many times throughout their history. Their original homeland was in present-day southern Ohio, West Virginia, and western Pennsylvania. In the mid-1600s, however, the Iroquois drove them out of these areas. The Shawnees were scattered to South Carolina, the Tennessee Cumberland River Basin, and southern Illinois. By the 1730s, most had returned to their original lands. In the following decades they fought hard against encroaching white settlements in Ohio and Pennsylvania.

As the several Shawnee bands moved, they also changed their alliances between the French and the English. Many of the Shawnees sided with the French in the period from 1689 until the end of the French and Indian War (1754–1763) in 1763. However, some did ally themselves with the English because they believed that English trade goods were better than those of the French. As a result, the English were able to establish an important trading post at Pickawillany in Shawnee territory in Ohio. Most of the Shawnees, however, fought the English, along with other natives, including the Ottawas, in Chief Pontiac's Rebellion in 1763. And in 1773, the Shawnees fought against Virginians in Lord Dunmore's War.

King George III's Proclamation of 1763 had all but promised Native Americans the lands west of the Appalachian Mountains. However, the governor of Virginia, John Murray, Earl of Dunmore, began parceling out western lands to veterans of the French and Indian War. Thus, Shawnee chief Cornstalk led Shawnee warriors in an armed attempt to drive the settlers out of trans-Appalachian lands, sparking Lord Dunmore's War (1774). After a series of bloody raids and counterraids, on October 6, 1774, Colonel Andrew Lewis, commanding 1,100 militiamen, defeated chiefs Cornstalk and Logan (of the Mingos), an Iroquois subtribe at Point Pleasant in present-day West Virginia, in a fierce battle. Cornstalk subsequently signed a peace treaty that punished the Shawnees with forfeiture of some of their lands.

Depiction of a Shawnee American Indian from Georges Henri Victor Collot's *Voyage dans l'Amérique Septentrionale.* (Library of Congress/Geography and Map Division)

During the American War of Independence, the Shawnees sided with the British. In 1778, they even managed to capture the famed frontiersman Daniel Boone. He was held prisoner at Chillicothe, Ohio, but subsequently escaped. By 1794, the Shawnees and other natives in the Northwest Territories had fought several pitched engagements with forces dispatched by the U.S. government. The most famous of the Shawnees were Tecumseh and his brother Tenskwatawa (the "Prophet"). They tried to unite the natives of the Mississippi Valley against the Americans. Their defeat at the 1811 Battle of Tippecanoe combined with the death of Tecumseh in battle on October 5, 1813, at the Battle of the Thames in Canada during the War of 1812 were key events in early American history.

Shield

Personal defensive armament carried by Europeans and some Native American groups. Shields came in various shapes and sizes and were fashioned from a variety of materials, depending on the group that created them.

Shields of European manufacture were most commonly made of steel reinforced wood. They were carried by the earliest Europeans to come to America, before guns had completely supplanted edged weapons. Shields made and carried by Europeans came in a variety of styles and shapes. The Scots carried small round shields known as targets, roughly a foot in diameter. Larger shields were rectangular or triangular in shape and were several feet in height and more than a foot in width.

Native American shields, on the other hand, were made of animal hides, shrunken to increase their density. This process also increased the shield's deflective capability. They were most often round and roughly a foot in diameter. Design and size varied widely.

Shipbuilding in Colonial North America

An abundance of natural resources helped assure that ship building would become an important colonial enterprise. In the 16th century, shipwrecked Spanish and French explorers built ships to escape the North American coast, and by the early 17th century Dutch and English mariners were building ships there to explore it. Shipbuilding, as a sustained effort to support a community, had its true beginning in the mid-1630s, however, when Massachusetts Puritans built several ships for the transAtlantic trade. As the flood of English immigrants and their cash slowed to a trickle in the early 1640s, shipbuilding became the means to develop new sources of income through fishing and trade with Britain and the West Indies.

Massachusetts leaders encouraged shipbuilders with free land and exemption from militia training and established construction standards complete with inspections and fines for defective work. Virginia had the resources for shipbuilding but not the incentive because of the demand for tobacco in England. Beyond small vessels for local communication and transportation, there was little shipbuilding in the southern colonies until the middle of the 18th century.

Faced with high construction costs as they struggled to replace ships lost to French privateers in the 1690s, some English merchants turned to the shipyards of New England. Statements by British shipbuilders that colonial ships were inferior faded before cheaper building rates and New England shipbuilding entered a long period of expansion. Even with the end of hostilities and the subsequent reduction of demand, enough British merchants had been satisfied with their colonial ships and continued to purchase New England tonnage. Boston, with its concentration of capital, builders, and workmen dominated New England shipbuilding. With lower material costs and construction rates, Charles Town, Scituate, Salem, Newbury, and Newport became shipbuilding centers that appealed to both the merchant who wanted the least costly ship and the one who wanted more ship for his money.

At the end of the first quarter of the 18th century, Boston's ship-building leadership was challenged by Philadelphia. Connecticut, especially the New London area, was also producing some of the largest merchant ships of the colonial period, and shipbuilding was becoming important in New York, thanks to an expanding West Indian trade. Although many colonial vessels were owned by local merchants, many were constructed for sale in Great Britain. By 1730, one-sixth of the British merchant fleet had been built in the shipyards of colonial America.

Woodcut of an 18th-century New England shipyard. (The Granger Collection)

The typical colonial shipyard was a simple affair. Urban shipyards, clustered along the waterfront or in nearby coves, had little more than an open sawpit and a tool shed for facilities. In smaller communities with cheaper land, the colonial shipyard was larger and might include sheds, covered work areas, and a wharf, all overlooked by the shipwright's house. A labor force of a pair of sawyers, four to six shipwrights (including the shipyard owner), and several apprentices was sufficient for most projects. Very large vessels or rush orders required additional shipwrights. After shipwrights completed the basic construction, joiners, caulkers, tanners, tinmen, masons, glaziers, carvers, painters, mast makers, ropemakers, blacksmiths, riggers, sailmakers, and boatmakers made their contributions. Thus the shipyard owner had to supervise and coordinate the work of more than a dozen different craftsmen before the ship was finished.

Eighteenth-century shipyards launched four basic vessels. The sloop, a single-mast vessel with a fore-and-aft rig, ranged in size from 20- to 40-ton coasters to 50- or 100-ton West Indian traders that added square main and topsails to their rigs. The latter variation was popular with pirates in the first quarter of the century. By setting its fore and aft sails on two masts, the schooner had a more flexible and manageable rig that required fewer hands and lowered operating costs. Schooners varied in size from small coasters to

larger ones in the West Indian and even the transAtlantic trades. Eventually, the schooner displaced the sloop except in Connecticut and Rhode Island.

The brigantine, a two mast vessel with square sails on the fore-mast and a fore-and-aft sail on the mainmast, was larger than the sloop or schooner and engaged in both West Indian and transAtlantic trades. Because its long boom could catch waves when sailing downwind, a variation of the brigantine, called the snow, carried square sails on both masts and a smaller fore-and-aft sail set on a pole just behind the mainmast. Snows were slightly larger than brigantines and were used as a cheaper alternative to a ship. With three masts and square sails (plus a small fore-and-aft sail on the mizzenmast) and double the tonnage of most brigantines, the ship was the basic carrier for transAtlantic trade and came in a wide range of sizes.

A local merchant, acting for himself or as the representative of a British correspondent, provided the necessary capital and market outlet that supported the construction of a ship. Although most ships were built to fill specific orders and thus ensured payment, some vessels were built on speculation. Launching ships of comparable quality and lower price per ton, the ratio of colonial built ships in the British merchant fleet rose from 1 in 6 in 1730 to 1 in 4 by 1760 and reached 1 in 2.5 (40 percent) on the eve of the American Revolutionary War.

Given the cost advantage of colonial ships, it was inevitable that the Royal Navy would try American-built warships. The demanding requirements of a warship (a stable gun platform for cannon high above the waterline on a seaworthy and swift hull with sufficient capacity for crew and supplies) and the greater amount of timber and labor, made naval construction more complicated and risky than building merchant ships. In the 1690s, the Admiralty purchased two warships from colonial yards. Although both ships passed rigorous examinations and gave long service (the 40-gun Falkland was still afloat more than 70 years later), they did not overcome the opposition of British builders to colonial competition. In the 1740s, the British Admiralty tried to reward New England for its role in the capture of Louisbourg with contracts for four warships. Reluctant to enter warship construction when other work was available, most shipwrights declined the offer. The two ships that were built, the 24gun Boston and the 44-gun America, had brief naval careers.

Although the Royal Navy no longer purchased American-built warships, colonial shipyards provided sloops and schooners that served as patrol and dispatch vessels and merchant ships that became transports and supply ships. Furthermore, during the French and Indian War (1754–1763), New England shipwrights supported the British Army by building hundreds of whaleboats, plus sloops and row galleys on Lake George, Lake Champlain, and Lake Ontario.

During the Anglo-Spanish War (1739–1744) and the French and Indian War, shipyards produced several warships (less than 20 guns each) for use by individual colonies. Fear of imminent enemy attack and large work forces enabled these vessels to be completed in under 40 days. Colonial shipwrights launched many small and some very large privateers, equal in size and armaments to small Royal Navy frigates.

The lure of windfall profits persuaded many merchants to risk their capital in a privateer whose very size made it more costly to build, equip, and maintain than the smaller privateer. Most privateers didn't capture prizes enough to balance their own cost and many were lost to enemy warships or to the sea itself. Whatever the return on the venture of large privateers, colonial shipwrights gained experience with privateer and warship construction that would prove vital in the coming American Revolutionary War.

In the mid-18th century, shipbuilding in the southern colonies expanded rapidly. By the time of the American Revolution, Virginia shipyards were ranked third, behind New England and Pennsylvania, in producing ships purchased by English merchants. Some of the expansion might be attributed to Chesapeake Bay merchants and their West Indies and British trade. That New England built brigs and ships averaged 10 to 20 percent smaller than those of Virginia suggests lower construction costs in Chesapeake Bay. Part of this difference might be the plentiful supply of timber in the southern colonies. A more likely explanation is the growing use of slave labor in southern shipyards.

If the shipyard was a relatively simple affair with little equipment, then materials and labor were the major cost factors. Slave labor was

present in New England and Philadelphia shipyards during the 18th century but in limited numbers—one or two in some yards and none in others. Inventories of southern shipwrights reveal slave ownership to be common. Although skilled slaves certainly cut construction costs, they also eased the chronic labor shortage and enabled southern yards to have a steady labor force, whereas northern yards had workers departing for higher wages elsewhere.

Colonial shipyards produced a variety of vessels and enjoyed a reputation for quality and economy. By the end of the colonial period, shipbuilding was the major non-agricultural source of income in America. However, the health of the shipbuilding industry in the colonies depended on the sale of ships to British merchants and the use of shipping within the British Empire.

Shirley, William

Born: December 2, 1694 Died: March 24, 1771

English governor of Massachusetts (1741–1756) and of the Bahamas (1761–1769). A consummate politician with expansionist views for the British Empire in North America, William Shirley directed much of the early effort in the French and Indian War (1754–1763). Born in Preston, Sussex, England, on December 2, 1694, Shirley attended Cambridge University before emigrating to Boston in 1731.

In Boston, Shirley carefully employed family connections in England to secure the governorship of Massachusetts for himself in 1741. When King George's War (1744–1748) began, Shirley cajoled the Massachusetts legislature into financing an expedition against the French stronghold at Louisbourg, on Cape Breton Island. After the fortress fell to the British in 1745, he rightly claimed much of the credit for so vigorously backing the effort.

William Shirley, governor of Massachusetts. Shirley favored expansionist policies. (Cirker, Hayward, ed., *Dictionary of American Portraits*, 1967)

In recognition of this success, the ministry in London awarded Shirley a colonelcy and ordered him to raise a regiment of colonials. He moved quickly to improve Massachusetts' defenses and consulted with British leaders on proposed plans to invade Canada. In 1746, 1747, and 1748, the ministry repeatedly abandoned such plans, however. This stymied Shirley's dream of projecting British power into Canada.

With the end of the war in 1748, Shirley found himself at the center of a political realignment in Massachusetts. When a group of his former allies organized a campaign to have him removed from office, Shirley sailed for England in late 1748 to defend his conduct. He did so quite ably. While in London, he received the prestigious appointment as one of the commissioners to negotiate with the French the final settlement of the Treaty of Aix-la-Chapelle (1748) ending King George's War (known as the War of the Austrian Succession in Europe). Shirley pushed his expansionist views of British power on both his fellow commissioners and ministry officials in London. The ministry held a more limited conception of the empire, however, and Shirley was recalled in 1752.

Shirley returned to Boston in 1753 to a warm reception. Conscious that the possibility of another war with France was never far off, he immediately set about to strengthen the colony's defenses. In 1754, he organized an expedition to Maine to secure Massachu-

setts' hold over that territory in response to reports of French encroachment. Later in the year, he vigorously supported the plan of colonial union discussed at the 1754 Albany Conference.

Shirley spent the winter of 1754–1755 organizing an ambitious campaign to secure Nova Scotia. Although the ministry had not sanctioned such a plan, officials were impressed with Shirley's initiative and quickly incorporated this northern component into their broader military plans. The home government also authorized Shirley to begin recruiting for his defunct regiment, which he did with great enthusiasm. In Massachusetts alone, Shirley raised a force of 7,000 men, which far exceeded his superiors' expectations.

The arrival of the new British commander in chief in North America, Major General Edward Braddock, produced a conference of governors in Virginia in April 1755. Shirley so impressed Braddock with his confidence and knowledge that Braddock appointed him second-in-command of British forces in North America. Despite Shirley's lack of experience in leading troops in battle, Braddock also authorized him to lead an expedition against Fort Niagara.

Shortly before launching the attack in the eastern Great Lakes region, Shirley received news of Braddock's defeat and death in the Battle of the Monongahela (during which his son had been killed). Now commander of all British forces on the continent, Shirley hesitated about the wisdom of proceeding as planned. Instead he sent his forces to Fort Oswego, deciding that the campaign against Fort Niagara would wait until the spring. In December 1755, at a conference of governors held in New York, Shirley outlined a bold plan of attack for the 1756 spring campaign. He vowed to push on with the efforts that had stalled the previous year.

Shirley's enemies worked vigorously against him, however. They penned letters to officials in London decrying Shirley's inability to hold such a high command. Shirley was unaware of the smear campaign, but he had assumed the ministry would replace him with an experienced military leader. In the meantime, he devoted his energy to building up British forces. As spring 1756 approached, Shirley scaled back his campaign plans, announcing that the expedition against Crown Point would take precedence over other ventures.

By mid-1756, Shirley's vacillations had angered a sufficient number of colonials to bring about his recall. His successor, John Campbell, Lord Loudoun, arrived in New York City in mid-July 1756, amid rumors that Shirley had been relieved of command in disgrace. Shirley immediately sailed for England to answer charges that his accounts while commander in chief had contained irregularities. He was not cleared of wrongdoing until 1758. From 1761 to 1769 Shirley served as governor of the Bahamas. He retired in 1770 and died in Roxbury, Massachusetts, on March 24, 1771.

Sickness and Mortality

Because North America's original European settlers traveled there over long distances in small, underprovisioned vessels, disease was the primary cause of mortality from the earliest immigration. Under the best of circumstances, the voyage from England in the early 1600s took more than six weeks. Rations during the voyage consisted mostly of meat, bread, and dried legumes.

The passengers were crowded into small, poorly ventilated spaces. Seasickness, scurvy, smallpox, dysentery, and various febrile diseases were the rule rather than the exception. Of John Blackwell's 150 Puritans who sailed in 1618, 130 died in transit. Of 100 Pilgrims that landed at Plymouth in 1620, only 50 were still alive three months

later, most having died of scurvy or infections acquired aboard ship. Of the initial 4,170 settlers who came to Jamestown in 1621, more than 2,000 succumbed to disease, and the survivors complained they could not sleep at night for the moaning of the sick and dying.

Ironically, disease was not altogether detrimental to the colonists. It is likely that the Pilgrims were saved from annihilation by local natives because the native population itself had been cut by 90 percent in the previous four years by epidemic diseases brought by earlier European visitors.

Scurvy had been the primary killer of sailors and nautical passengers since improvements in navigation made long voyages out of sight of land possible. The disease results from lack of vitamin C (ascorbic acid), which is normally acquired from citrus fruits and to a lesser extent from leafy vegetables such as cabbage or from onions and potatoes. In the absence of an ongoing supply of dietary vitamin C, symptoms of scurvy appear within two weeks and include weakness, swelling of the legs, softening of the gums culminating in loss of teeth, bleeding from mucous membranes, and, ultimately, death from heart failure.

British naval surgeon James Lind had proven the disease could be prevented by prophylactic ingestion of lemon juice in 1747, but the practice did not become routine in the Royal Navy until 1793, and scurvy was a plague to both military and civilian sailors through

Artist's depiction of a colonial-era physician "bleeding" a woman. Bloodletting was believed to rid the body of infection. (Frank Grizzard)

the 18th century. In British ships posted to the West Indies during that time, about one man in seven died of scurvy while on post.

Close quarters aboard ship made transmission of infections quite likely. Typhus, which was transmitted by omnipresent lice, was particularly severe and reached a peak in British prison hulks anchored in New York harbor during the American Revolutionary War. Measles, scarlet fever, influenza, and diphtheria were also recurrent epidemics. Seasickness was also significant, both because of the direct misery it caused and because it weakened passengers and left them susceptible to more lethal diseases.

Smallpox was also a particular problem, with recurrent epidemics beginning in 1663 in New Netherland and recurring every few years thereafter. William Penn's ship alone lost 30 settlers to the disease in 1682. Soldiers often carried the disease, and Pennsylvania suffered a disastrous outbreak when British troops brought it to Philadelphia in 1756. A smallpox epidemic in Boston after British forces evacuated the city in 1775 frightened people more than the nascent revolution.

In 1721, Lady Wortley Montague brought the Turkish practice of inoculating people who had not had smallpox with matter acquired from the sores of people with relatively mild cases. Inoculation caused real cases of the disease and, although not without risk, carried a lower mortality than naturally acquired smallpox. John Adams commented that the only reason he was picked for the Continental Congress was that he had been inoculated against smallpox and was, therefore, immune. After smallpox forced his troops to withdraw from their Canadian invasion in 1775 during the American Revolutionary War, General George Washington mandated that all Continental Army soldiers be inoculated. Smallpox remained a significant problem until 1798, when Edward Jenner demonstrated that inoculation with the almost entirely safe cowpox virus conveyed lasting immunity against the disease.

Dysentery was a particularly severe problem both on board ship and on land. George Percy, the Earl of Northumberland's brother, complained in 1607 that the Jamestown settlement was being destroyed by "swellings, fluxes, and burning fevers" as much as by wars with the natives. Ships might bring contaminated water aboard and repeatedly distribute it throughout a voyage. Settlements were often built with little concern for drainage and with latrines close by water that was used for washing and drinking.

The more concentrated the population became, the higher the likelihood of the water supplies becoming contaminated. Whenever there was a military expedition, dysentery followed the troops. A 1709 British expedition against French Canada had to be abandoned when dysentery broke out near Wood Creek, New York. The disease was also widespread in the earliest Continental Army encampments during the American Revolutionary War in 1775 and 1776.

Yellow fever, although less common than other febrile diseases, was particularly feared because it carried a mortality rate approaching 30 percent. The disease came from West Africa with the slave trade and was especially well adapted to transmission over the sea lanes.

The disease is carried by the *Aedes aegypti* mosquito that reproduces only in standing fresh water such as that found in ships' water barrels. It first appeared in Barbados in 1647 and, beginning with 1699 epidemics in Philadelphia and Charles Town (present-day Charleston, South Carolina), repeatedly struck port cities from Boston to New Orleans throughout the colonial period. A particularly severe episode in New York in 1702 cost the city 10 percent of its population.

Skulking Way of War

A form of warfare in which attackers used stealth to surprise their enemies, employed largely by Native Americans and later adopted by Europeans in North America. Ambushes were typical of the skulking way of war, as were raids on small, isolated garrisons or settlements. Skulking tactics relied on detailed knowledge of local terrain and the cover of darkness to conceal movements and acquire positions from which to waylay foes. Attackers also exercised individual initiative, advancing or retreating in open order. Many times, individual combatants aimed and fired at specific targets on their own volition. Combatants usually did not press attacks against enemies who were well prepared to receive an assault, avoided pitched battles, and retreated if they were themselves ambushed.

Native Americans pursued skulking warfare throughout the colonial period. Although other forms of combat occurred in particular cases, skulking tactics prevailed among American Indian warriors throughout the period. Over time, Native American combatants also replaced indigenous arms (bow and arrows, edged weapons, etc.) with firearms of European manufacture as their primary weapon.

In contrast to the skulking way of war, conventional European warfare of the period emphasized the role of prescribed, orderly battle. Infantry moved in unison, in compact, close-order formations, handling and discharging weapons together in volleys fired

A band of Abenaki Native Americans raiding the English settlement of Haverhill in 1697. Among those taken from the village were Hannah Duston, her infant (who was killed), and their nurse. Hannah's husband and seven other children got away. This illustration depicts Mr. Duston covering the escape of his remaining children. (Library of Congress)

under the direction of officers. Europeans and their colonial descendants varied in their abilities to adapt to or cope with skulking warfare. Militiamen from New France were largely successful in employing these tactics. In fact, they often joined with their American Indian allies in raiding the English colonial frontier during wars between the two countries.

English forces often had more difficulty coping with skulking foes, particularly in conflicts such as King Philip's War (1675–1676), where effective military responses emphasized direct assaults on American Indian communities or employing native allies against aboriginal foes. However, by the mid-18th century, some British colonial units such as Rogers's Rangers were primarily employing skulking tactics.

Slaughter of the Innocents

Start Date: February 25, 1643 End Date: February 26, 1643

February 1643 attack by Dutch troops outside New Amsterdam (present-day New York City) in which two camps of Wappinger natives were overrun without warning resulting in the deaths of over 100 men, women, and children. The attack occurred during Kieft's War (1639–1645).

New Netherland's fifth governor, Willem Kieft, arrived in the New World in 1638. His tenure was marked by a succession of crises and controversies. Conflict between various Native American peoples and the Dutch had become routine. Aggressive territorial

Contemporary illustration of Dutch soldiers attacking Wappinger Native Americans in Pavonia on February 25–26, 1643. This massacre became known as the Slaughter of the Innocents. (North Wind Picture Archives)

expansion also contributed to the tensions. When Kieft arrived, he was not pleased with the condition of New Amsterdam, the main settlement in the colony. Defenses, especially the main fort, were in poor condition. To correct this problem he made numerous reforms in government and military administration.

Among Kieft's changes was a heavy tax on the local natives, who were part of the Algonquian group, in return for protection against hostile natives such as the Mohawks. The Mohawks were important trading partners with the Dutch, and Kieft used them to terrorize other native peoples who refused to pay the tax. In 1641, several tribes refused to pay the tax and then attacked an outlying Dutch settlement. This led to a four-year struggle between the Dutch and various Native American groups.

In the spring of 1642, the governor sent an expeditionary force to subdue the Raritans, one of the offending tribes. A treaty with them, however, prevented further bloodshed. Yet Kieft was determined to collect the tax from other Native Americans. In early 1643,

he put pressure on the Wappingers, who lived above Manhattan Island along the lower Hudson River. Kieft ordered a large party of Mohawks to collect the tribute that had not been paid. The Wappingers, numbering about 500 people, fled before the advancing invaders. Most took refuge with the Hackensacks at Pavonia (present-day Jersey City, New Jersey). Others fled to "Corlaer's Hook," in northern Manhattan.

Kieft badly mismanaged the situation. The fleeing Native Americans arrived seeking Dutch protection. They had no intention of waging battle. Kieft did not see it that way, however. On a cold night at the end of February, without any warning or provocation, the governor dispatched the Mohawks to Pavonia to initiate an attack. Eighty Dutch soldiers followed closely behind. A smaller number of Dutch troops killed the native refugees at Corlaer's Hook.

During the night of February 25–26, 1643, some 100 Native American men, women, and children were brutally murdered in what was later known as the Slaughter of the Innocents. The Dutch

soldiers returned to New Amsterdam the following day, carrying with them the severed heads of nearly 80 natives. Some of the Dutch then used the heads like footballs. Kieft also ordered the public torture of some 30 native captives.

Kieft took immense delight at the success of the raid, but this Dutch atrocity served to further incense the local natives. Eleven of them subsequently united in waging war against the Dutch, burning farms and killing settlers. Throughout the remainder of the year, the Dutch suffered numerous losses fighting the natives. In February 1644, Dutch forces managed to kill more than 500 natives in the region of Westchester. Finally, in 1645, after four years of steady conflict, Kieft negotiated a treaty ending a war that had claimed more than 1,000 lives on both sides.

Slavery

Taken off a Portuguese slave ship from Angola by a Dutch privateer and brought to Jamestown, Virginia, in 1618, the first Africans sold in the colony were not slaves but indentured servants. Their new owner promptly reexported them to a plantation he owned in Bermuda. The following year, 1619, another Dutch privateer arrived in Virginia with Africans seized from another Portuguese ship. These two incidents illustrate several points. First, despite all that has been written about slavery, there is so much that is not known about the subject. Second, slave ships were sought out as valuable prizes by privateers and pirates throughout the colonial period. Finally, if the first generation of Africans were technically indentured servants (the term "slave" didn't appear in the records until the middle years of the century), then what was their position in the community?

English indentured servants, who provided the work force in 17th century Virginia, generally served on average a seven-year term in exchange for transportation to Chesapeake Bay. Africans were bound to a minimum 14-year term. And whereas master and servants often lived together under the same roof, along with precious cows, an archaeological site from the 1620s indicates a separate dwelling for African servants. Furthermore, when guilty of offenses that earned English servants an extra year of labor, African servants were sentenced to permanent servitude (slavery). Despite these

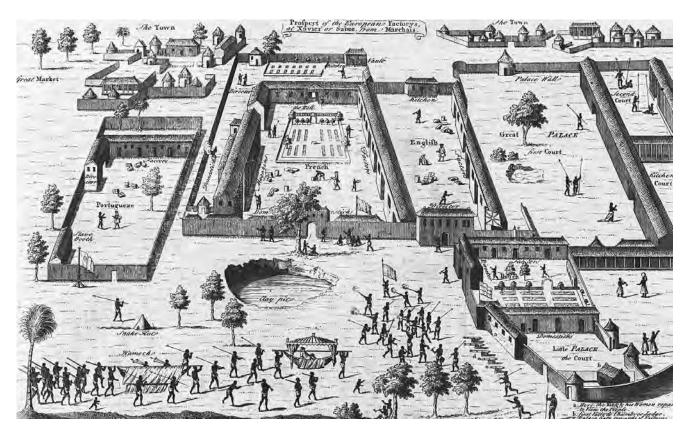

obstacles, some African servants survived, completed their indentures, and became landowners. Similarly, African servants in the Dutch colony of New Netherland became free men and landowners until driven off Manhattan Island after the English takeover in 1664.

Although Africans formed only 2 percent of Virginia's nonnative population for most of the 17th century, their presence and status troubled the English colonists. In the 1660s, the legislature established several precedents involving slavery. These held that non-Christian servants imported into Virginia by ship were slaves for life, baptism into the Church of England did not release Africans from slavery, the children of slave mothers were also slaves, and free Africans were not entitled to the same privileges as free English people.

With improving economic conditions in England, rising land prices in Virginia, and the lure of a new colony called Pennsylvania (known as "the best poor man's Country"), servant migration to Virginia declined in the late 17th century. At the same time, the small slave population was reproducing itself and tobacco plantations were expanding. Given the choice between English servants who were harder to recruit and were freed after seven years or African slaves who were never free and whose children were slaves, Virginia plantation owners understandably turned to slave labor. Besides providing plantation owners with as large a labor force as they desired, slavery also assisted the small farmer whose labor force had been his family. With a few slaves, he could raise enough tobacco to survive and, perhaps in time, prosper.

Until the 18th century, Maryland followed the Virginia pattern of tobacco dependency and slaves displacing servant labor. Then, between a growing merchant community seeking new sources of income and recognition of Virginia's advantages of soil and reputation in tobacco and the large labor force its cultivation required, some Maryland slave owners found that grain and timber provided a satisfactory income with a smaller labor force working fewer hours. This dispassionate, nonstatus perspective meant that the growth of slavery in Maryland would not match that of Virginia. Hence, although a number of Virginia counties had a majority of black inhabitants, whites outnumbered blacks in all Maryland counties. Furthermore, though slavery expanded into the western Virginia Piedmont and beyond in the late colonial years, it remained confined to Maryland's Tidewater area. Finally, in the latter half of the 18th century, there were more free blacks in Maryland than in Virginia.

With slave owners from Barbados among its early colonists, South Carolina quickly established the legal framework for slavery. However, a high death rate limited enterprises to those requiring few workers (cattle and deerskins) and few slaves were imported into the colony. In the early 18th century, however, rice production and the importation of slaves directly from Africa both expanded rapidly. Between the few English servants arriving and a high death rate continuing among colonists, the African population of South Carolina soon outnumbered the English. Whether Africans brought vital experience to rice cultivation or just provided the necessary

An 18th-century engraving of a slave compound maintained by European traders on the Gulf of Guinea in Nigeria. (Library of Congress)

labor has been debated. Given the variety of agricultural practices regarding rice in West Africa (including both field and swamp cultivation and dikes and irrigation) and their centuries of experience with the crop, it is clear that Africans supplied the knowledge and the muscle that made rice both possible and profitable.

Although slavery was basically a southern institution, there were slaves in all of the colonies. In New York, the northern colony with the most slaves, they worked on Hudson River Valley farms and in New York City. Slaves appeared early in Philadelphia and by the beginning of the 18th century they worked as servants, ship carpenters, and ironworkers. Then the flood of indentured servants landing at Philadelphia overwhelmed this initial growth of slavery and the proportion of slaves in the colony rapidly dwindled. Even in New England, where the institution of slavery was weakest, slaves were a visible part of society. In Connecticut, the region's leading slaveholding colony, most slaves were owned by families (one or two per family) and others worked on large farms and for tradesmen. Although Rhode Island is identified with the slave trade and slaves outnumbered white servants at the beginning of the 18th century, the proportion of Africans had declined to 6 percent of the population at the end of the colonial period. Massachusetts too participated in the slave trade as a minor player, but its African population reached a high in the mid-18th century of only 2 percent. Some Massachusetts slaves worked as servants, others in maritime trades.

When the last colony, Georgia, was founded in 1733, slavery was specifically prohibited there. But the shortage of labor and the need to establish income soon persuaded proprietors to allow colonists to "rent" Africans from suppliers in neighboring South Carolina. Altogether, on the eve of the American Revolutionary War, one quarter of the colonial population consisted of slaves and free blacks of whom four-fifths had been born in America and lived in southern colonies.

As with the majority of colonists, most slaves were agricultural workers. Yet a number of slaves were tradesmen. They might practice their trade on the plantation or be rented by the month or year to a master craftsman at a distance from their owner. The slave tradesman earned a higher return for his master than the agricultural laborer, and his work was not limited by crop cycles. The growing presence of slaves in skilled professions that ranged from bricklayers to harbor pilots was a direct threat to white colonists, however. Once free and without the protection of influential community members, blacks would be shut out of most skilled occupations.

Slaves were a significant element of all urban settings. From the sleepy village of Williamsburg, Virginia, to the commercial hubs of Philadelphia and New York, cities offered opportunity. The slave might have the chance to earn money and eventual freedom, the single person could seek a mate, and, if nothing else, the city offered excitement and choices not found on the plantation. The presence

of blacks in cities caused much concern and restrictions were periodically enacted but seldom enforced.

In the last generation, much has been learned about the life of plantation slaves. Despite lack of control over their own lives, differences of origin in Africa and between those born in Africa and in the colonies and an unfavorable male to female ratio in many areas, plantation records demonstrate that slaves did form families. Some families continued generation after generation, even though colonial law did not recognize slave marriage.

Archaeological examinations of slave quarter sites reveal a host of extremes. The quarters that survive tend to be those of house servants and skilled non-agricultural workers. Structures were usually small single-family units built with a minimum of material. Although storage consisted of pits covered with planks and beds might be a cornhusk mattress on the dirt floor, the quarters of house servants might also contain "castoffs" from the master such as out-of-style English tableware as well as African-style pottery for cooking and food storage. These tiny, often windowless units provided shelter for the night and gave inhabitants a temporary refuge from the world. African tokens have been found in the walls of huts, and the African tradition of using the open space in front of the shelter as a daytime living space continued.

On Virginia tobacco plantations, slave quarters were clustered in close proximity to the master's house—usually behind, and if topography allowed, downhill. In other words, the slave quarters were out of public view but near enough for the owner to check on them easily. In South Carolina, as planters built houses on navigable rivers away from the swamps where they cultivated rice, slaves lived in huts near their work site. Distance from masters allowed these slaves more opportunity to preserve African traditions.

With slavery, as with any institution, the gap between regulations and practice varied with time and location. For example, in the 18th century, the Virginia legislature prohibited small Chesapeake Bay craft from having an all-slave crew. Slaves had to be under supervision, especially if they had both freedom of movement and opportunity to do harm. But for masters, who believed that their crews were reliable and had other interests to pursue, the law made no sense and they ignored it. Although the popular image of slavery is that of an absolute system, in practice there could be much flexibility.

The fact that slavery was a profitable but inefficient institution was recognized not just by contemporary scholars but also by some colonial owners. In South Carolina, slave labor was often organized by task and when completed, the rest of the day belonged to the slave. An ironworks owner in Maryland gave credit at a store to slaves who worked to his satisfaction. And some slave craftsmen were allowed to find their own lodgings and employment so long as they gave their owners a certain sum per month. These and other opportunities were limited, but they gave hope and encouragement to many slaves.

Warfare, a constant part of colonial life, offered opportunity along with the threat of death and destruction to slaves. Farmers, tradesmen, and merchants benefited from the need to supply military forces. Frequent shortages of soldiers forced colonies to choose between the fear of an armed black man and the need to recruit slaves to fight the enemy. Through military service in desperate times, slaves might be rewarded with freedom.

Fear of slaves was not completely unfounded, given the occasional murder of masters on plantations. Equally disturbing to whites was the sight of blacks in colonial cities moving freely about. In both the New York Slave Revolt of 1712 and the Stono Rebellion of 1739 in South Carolina, the fear of blacks was heightened by a society in or about to enter a war. Although these two events began with violent acts by slaves, and thus were clearly revolts, other events are not as clear. When New York City suffered a rash of fires in 1741 and authorities promised rewards for the apprehension of the perpetrators, a white servant girl accused her master of planning with blacks to burn the city. She received freedom and cash; her master and more than 30 blacks were executed. In Virginia, the legislature occasionally freed slaves for giving information about other slaves who were planning to rebel. With authorities ready to believe rumors of slave rebellion, legislatures rewarding informers and quickly executing those suspected of rebellion, it is difficult to separate planned revolts from false reports.

Unlike revolts, there is much information about runaway slaves in the advertisements of colonial newspapers. Unfortunately for slaves, their chances of escaping bondage permanently were not good. Roads were few and any strangers, let alone a black one, was likely to be questioned. Furthermore, in an enemy society, there was no refuge. A few runaways, usually recent arrivals from Africa, tried to live in wilderness or swamp areas but eventually they would be found. Others, with employable skills, sought safety in distant towns or went to sea as mariners. But again they were liable to eventual identification and return. South Carolina and Georgia runaways who managed to reach Spanish Florida found safety in a small black community on the outskirts of St. Augustine. Because of frequent raids by colonists into northern Florida, the African settlement of Fort Mosé was fortified. But for most slaves, the best opportunity to escape would only come with invading British armies during the American Revolutionary War.

If the great majority of slaves recognized the long odds against earning freedom or escaping, and the futility of rebellion, where could they focus their energies and hope? The wave of evangelicalism that swept the colonies in the four decades before the Revolution had a profound effect on many colonists including slaves. A number of churches accepted blacks. A few Methodist and Baptist ministers began to question the morality of slavery, as did the Quakers. And by the decade before the American Revolutionary War, Quakers began to persuade fellow members to free slaves. Of course, it is easy to overstate this movement. In the case of some Quakers, they "freed" their slaves but required them to pay an annual sum or return to slavery. Still, blacks quickly moved from being present in white churches, to having white ministers lead services at black churches, and finally being allowed to have black churches led by black ministers. With slaves traditionally having Sunday free, the church was the one institution where blacks were allowed to exercise some autonomy. Thus the church and the family became central to the slave experience during the colonial years and would remain central to African American life in the centuries that followed.

Slave Trade and the American Colonies

The slave trade involved the shipment of slaves from West Africa to the New World. Once the dominant Atlantic slave trade carrier, Portugal gave way in the early 17th century to English and Dutch merchant fleets. Portugal concentrated on bringing slaves to its plantations in Brazil.

In the late 17th century, immigration indentured servants declined as economic conditions in England improved, the advantages of a permanent work force became clear to Chesapeake and Carolina plantation owners, and African slaves became the most common form of agricultural labor in the southern colonies. The Atlantic slave trade was at its height in the 18th century, and English ships carried the most slaves.

Although there is disagreement about how many Africans crossed the Atlantic (estimates vary from between 9 and 11 million

Approximate Prices for Various Items in the Middle Colonies during the French and Indian War

Item	Price (in local currency)		
Adult male slave	\$63.39		
Beef (per lb)	\$0.02		
Butter (per lb)	\$0.07		
Corn (per bushel)	\$0.27		
Pork (per lb)	\$0.06		
Rum (per gallon)	\$1.00

Sugar (per lb)	\$0.09		
Wheat (per bushel)	\$0.58		

people), there is agreement that the largest share (41 percent) went to Brazil and many (29 percent) went to the British West Indies, and that only a small proportion (3 to 4.5 percent) went to the mainland colonies of British North America. Chesapeake Bay, where Virginia planters were notorious for purchasing just a few slaves at a time, represented the last stop for slave ships that had encountered disappointing markets in the West Indies.

Although the Atlantic slave trade was one of Britain's major enterprises, the role of colonial Americans appears to have been a minor one. There are numerous reasons for this. Success in the Atlantic slave trade depended on many factors, of which luck was not the least. Shipping, supplies, sailors, and trade goods had to be secured at reasonable rates. African markets had to offer a plentiful supply of slaves and food from recent harvests to feed them. Crowded conditions and lengthy passages affected slaves, sailors, and profits. How many people died on the voyages is still debated but the 12 percent estimate that seems likely pales before the one in three Africans who died between being captured and actually boarding a ship. A similar death rate was likely once ashore in America. Some slave ships carried physicians to identify and prevent sick Africans from boarding.

Slave ships of all nations were attractive prizes. Thus, the first Africans in Virginia arrived aboard Dutch privateers that had taken them off Portuguese slavers out of Angola. Besides the danger of attack from other vessels and assaults by Africans against ships in port, slave uprisings were frequent enough that some ships were outfitted with defensive barricades on the forecastle and quarterdeck.

Finally, there was the issue of market timing. Chesapeake Bay plantation owners preferred to purchase slaves when tobacco was planted or harvested (spring and late summer). The longer planting, growing, and harvesting season of rice meant that Carolina planters needed labor from the spring through early fall months. Even arrival in the right months was no guarantee that slaves aboard ship would be purchased by planters ashore. The slave trade remained a risky business.

Given the above variables, most colonial merchants preferred less hazardous enterprises, leaving the slave trade to British merchants. Some Americans, mostly based at Newport, Rhode Island, did engage in the Atlantic slave trade. The limited ownership of slaving vessels does not reflect the complete role of colonists in the slave trade, however. Given the popularity of colonial ships with British merchants, it was inevitable that a number of these would end up in the slave trade. For example, of ships built in Virginia, about one-quarter traded between Virginia and Britain, one-fifth carried cargoes between Britain and West Indian ports, and vessels in the third largest category, one-eighth, were in the slave trade.

As with most 18th-century merchant ships used for a variety of trades, capacity and economical operation, not speed, were the critical factors. The few special requirements of a slave ship such as awnings to provide shade on the African coast, temporary slave

decks, air vents for circulation below, large cooking facilities, and even barricades to control slaves, could be easily fitted to merchant ships. Thus, the all-purpose 18th-century vessel might be a slaver on one passage and a tobacco ship on the next. This would change drastically in the early 19th century as British warships sought to capture vessels engaged in the now-illegal slave trade. Slave ships became specialized vessels that sacrificed everything, including seaworthiness, for the speed necessary to escape pursuers. Many of these speedy ships would be built along Chesapeake Bay.

Thus, although colonial Americans were minor participants in the management of the Atlantic slave trade, they were actively engaged as suppliers of slave ships and purchasers of slaves. Without the Atlantic slave trade, the tobacco and rice plantations of the southern colonies would not have been possible.

Smallpox

A systemic viral disease that occurs in two forms: variola major, which carries 25 percent mortality, and variola minor, with a 1 percent mortality. The disease is caused by an orthopoxvirus. This DNA based organism is the largest virus that infects animals. The virus initially multiplies in the bloodstream before infecting internal organs, especially the lungs, liver, and spleen. About 12 days after exposure there is a secondary viremia at which time the organism infects the skin causing a rash that develops into vesicles after two to three days. Fluid from either infected lungs or from weeping vesicles carries viral particles and can spread the infection, although human-to-human transmission is usually by inhalation of infected airborne fluids. The disease is relatively contagious, with one drop of pulmonary secretion typically carrying 1,000 or more viral particles than are needed to cause an infection, although a carrier is typically infectious for only three to four days.

There is no treatment for an established infection, however smallpox was the first disease successfully prevented by creating immunity in potential hosts. For centuries the Chinese and later the Turks intentionally exposed susceptible people to infectious material from patients suffering from mild forms of smallpox. This "variolation" or "buying the pox" carried a mortality of some 1–10 percent but conferred permanent immunity. In 1796, English physician Edward Jenner proved that exposure to cowpox (Vaccinia) was almost universally safe and, in 99 percent of cases, conferred lasting immunity to the genetically related smallpox virus.

Smallpox has played an intentional and an unintentional military role over the centuries. A probable smallpox epidemic in Rome in AD 165 cost the city one-third of its population. Crusaders brought the disease to Western Europe on their return from the Levant. A combination of smallpox, influenza, and measles reduced the native population of the central Mexican plateau by 90 percent in less than five generations and made the military and cultural conquest of the Aztec and Inca Empires by the Spanish possible. In North America in 1763, the British commander in chief, Major General Jeffery Amherst, attempted to use smallpox as a weapon by ordering that infected blankets be distributed to Native Americans during Pontiac's Rebellion.

In 1958, smallpox was still killing two million people a year and the Soviet Union asked the World Health Organization to sponsor a world wide program to eradicate the disease. The program was started in 1967, and the last naturally occurring case of smallpox was documented in Somalia in 1977, making smallpox the first disease intentionally eradicated. Samples of the virus have been maintained at the Center for Communicable Disease in Atlanta and at the Russian State Research Center of Virology and Biotechnology (Vector) in Siberia, presumably for scientific research. The risk that smallpox will reappear as a bio-weapon has resulted in vaccination programs for the military and for health care providers and to discussions of widespread civilian vaccination.

Smith, John

Born: January 1580 Died: June 21, 1631

English explorer, soldier, author, and leader of the English settlement at Jamestown, Virginia. Born in Willoughby, Lincolnshire, England, in January 1580, John Smith attended school but left home at age 16 on the death of his father and traveled to the Netherlands. There he joined Dutch forces fighting against the Spaniards. Smith served for a brief time and then returned to England. He improved

his martial skills by studying books on military history and strategy and by learning horsemanship.

In 1600, Smith left England to join the Austrian forces under Archduke Ferdinand fighting the Turks. Smith attained the rank of captain in the Austrian Army and won accolades for killing three Turkish opponents in tournament combat. Later, he was wounded in battle in Transylvania, left for dead, and captured by the Turks, who enslaved him. Smith killed his master, escaped from the Ottoman Empire, and eventually made his way back to England in 1603.

Smith sailed to America in 1606 with the English expedition to Chesapeake Bay, under the auspices of the joint stock venture known as the London Company. The company appointed him as resident councilor; however, other leaders in the fledgling colony of Virginia feared Smith's domineering personality and prevented him from exercising much authority. When the colony ran into difficulty, however, they turned to him for leadership. The colonists elected him president in September 1608, a post he held until August 1609.

Recognizing the colony's weakness and the threat posed by the Powhatan Confederacy, Smith placed the colony on a military footing. He organized the settlers into companies, drilled them weekly,

English soldier and adventurer Captain John Smith helped to found the Virginia colony at Jamestown in 1607. His bold and vigorous leadership played a crucial role in the settlement's survival. (Library of Congress)

and assigned them various duties such as raising crops and strengthening Jamestown's defenses. One of his favorite mantras was, "He who does not work will not eat." To protect the colony and enable the settlers to procure needed supplies from the natives, Smith adopted a confrontational policy toward the Powhatans. Smith's stance was designed to keep the Powhatans in awe of the English without, however, provoking a full-scale war.

In December 1607, the Powhatans captured Smith in an ambush. Chief Powhatan, the leader of the confederacy, sentenced him to death. In what was probably a ritual intended to impress Smith and win better treatment from him, Powhatan's daughter, Pocahontas, intervened to prevent Smith's execution and win his release.

Smith was not intimidated, however, and continued his tough policies. He used threats to obtain food from the Powhatans. And when he met resistance, he confiscated corn, burned houses, killed natives, and took others hostage to ensure that his demands were met. On one such expedition in January 1609, a battle nearly erupted when Smith believed Opechancanough's Pamunkey warriors were poised to attack. Smith seized Opechancanough and threatened him with a pistol, thereby averting a crisis. Relations between the English and the natives improved after this confrontation. When Smith learned that settlers at outlying posts frequently were abusing the natives, Smith ordered the colonists to behave in a more conciliatory manner, so as not to provoke a war. His orders were ignored.

In September 1609, Smith was badly injured in a gunpowder explosion and subsequently returned to England. Although he did not return to Virginia, Smith received much credit for his work in establishing the colony. He would later journey to New England as an explorer for the Plymouth Company. In England, Smith wrote and published extensively about his experiences in North America. Perhaps the most famous of his works was *The General Historie of Virginia, New-England, and the Summer Isles* (1624). Smith remained an ardent promoter of colonization until his death in London on June 21, 1631.

Smuggling

Smuggling is the importation or exportation of goods in violation of customs laws. Smuggling in colonial North America was endemic. All colonial powers and their nationals either engaged in smuggling or spent enormous sums of time and/or money combating smuggling. All manner of goods were smuggled into the colonies. Smuggled items included tobacco, molasses, furs, sugar, manufactured goods, assorted luxury items, naval stores, and weapons.

The prime reason for smuggling goods was to turn a larger profit. The colonial mercantile system imposed heavy duties and a multitude of restrictions on trade between colonies and the mother land and other nations. Thus, traders wishing to maximize profits smuggled goods past customs officials. Although such activity could be risky, smugglers believed the vast increase in profits justified the practice.

Mercantile restrictions on trade imposed by imperial governments varied from nation to nation. British law prohibited the importation and exportation of any foreign goods into colonial ports on non-British ships. Non-British ships found in port could be confiscated and, along with their cargo, sold. The 1766 Navigation Act opened special free ports in the colonies in which foreign ships could buy British goods with bullion or local produce. However, foreign merchants could not import non-British goods. British ships could transport and sell foreign goods but had to pay a duty. In addition, British ships trading in colonial ports were barred from importing foreign produce or exporting British produce to foreign nations without paying a duty.

The commonly held perception of smuggling is one of the clandestine, off-loading of cargo in the dead of night off shore into row boats. However, a more common ruse was simple lying. Captains would simply tell British customs officials that they were en route

to a British port when in fact they were destined for a foreign port to sell their cargo.

Spanish trading regulations were more stringent. The Spanish government simply prohibited all imports and exports on any ship unless it was part of state-sanctioned "flotas." In addition, laws prescribed that only certain ports were able to engage in maritime trade and in those ports only certain "royal" merchants were allowed to take part in colonial trade.

Spanish merchant fleets could be infrequent and unreliable. If goods were late, damaged, or a shortage of a commodity developed, colonials had no official remedy other than to wait for the next "flota." An unofficial remedy was to allow goods to be brought into port on foreign ships or if nearby overland, from a foreign colony. These methods not only violated Spanish trade regulations but were in direct contravention of many international treaties. Nonetheless, colonial officials either looked the other way or encouraged such trade to procure needed items for the economic well-being of the colony.

French strictures mirrored those of Spain. The French government prohibited any trade with foreign merchants, with the notable exception of slaves. In 1767, the French opened some "free ports" in the Americas.

Although all nationals of the colonial powers engaged in smuggling, the English were the most widespread smugglers. In particular, colonial New Englanders were especially plentiful in the illicit trade. Smugglers did not discriminate. More often than not the smuggler would sneak goods into their own nation's colonies. Another complication for colonial customs officials was the fact that many legitimate licensed merchants engaged in smuggling as well as their legal trading operations.

Smuggling was used as a weapon against other colonial powers. As the Spanish Empire underwent decline, it became especially vulnerable to smuggling activities undertaken by English, French, and Dutch nationals. During the contentious 1700s, the powerful British Navy often protected English nationals engaged in smuggling. This helped deprive the Spanish Crown of much needed revenue to help support Spanish military efforts. In addition, Spanish merchants became reluctant to invest in trade between their American colonies and the homeland because of the depredations of privateers. When Spanish colonial merchants shipped goods, more often than not it was easier, safer, and cheaper to use shippers from England, North America, or a neutral nation. The effects of war and smuggling certainly contributed to the collapse of the Spanish Empire in the Americas.

Smuggling was a key contributor to the American Revolution. American merchants in British North America led many of the protests against the British Crown's attempts to assert control over colonial trade through the imposition of trade regulations. One of the chief reactions to regulations was smuggling, by many of the leading merchants of North America. British colonial merchants had long circumvented the numerous trade regulations passed by

Parliament in London. London imposed a series of Navigation Acts beginning in the 1650s that prohibited colonists from obtaining goods directly from other European powers unless shipped by English merchants through English ports and paying duties on goods arriving in port.

These goods, however, were easily obtained by smuggling them past customs officials in colonial ports. Or, they could be unloaded from ships off shore in North America onto ships owned by North American colonial merchants or independent smugglers. After reaching shore the goods were sold to consumers or merchants without paying import duties. The English government was losing valuable revenues, and merchants in London and other English ports complained bitterly that they too were losing great amounts of revenue. Complicating English attempts to exercise control over smuggling was the fact that during the numerous colonial wars the English government encouraged and protected smugglers.

The English used smuggling as a weapon to weaken their opponent's economic ability to wage war. Once hostilities ceased, it was hard to rein in English traders who were accustomed to smuggling goods. North American smugglers easily turned their tactics and energies to evading English customs authorities.

The profits to be earned in this activity during wartime were often enormous. Thus, asking smugglers to turn "legitimate" and abide by restrictive measures and pay import duties was more than most smugglers were willing to do.

The more laws passed by Parliament to regulate trade and collect duties, the more resentful colonial merchants became. These irate merchants turned more and more to smuggling as time wore on. Merchant protestations over import duties sometimes carried over into protesting any sort of taxation and permeated colonial society, as was the case in the 1760s and 1770s.

Snowshoes, Battle on Event Date: March 13, 1758

Winter battle of the French and Indian War (1754–1763) between irregular forces along the Lake Champlain corridor, at Fort Carillon (Ticonderoga) on March 13, 1758. The Battle on Snowshoes resulted in a rare, devastating defeat for Rogers's Rangers. It also marked the temporary end of British efforts to reverse the loss of Fort William Henry (New York) the year before.

Following the destruction of Fort William Henry, Major Robert Rogers, leading His Majesty's Independent Company of American Rangers, developed a plan to take by surprise French Fort St. Frédéric. The English hoped that success here would isolate the French garrison at Fort Carillon (later Fort Ticonderoga), bringing Lake George under British control. This might also help the English gain a foothold on Lake Champlain. The British commander in chief in North America, Captain General John Campbell, Lord Loudoun, approved the plan after canceling his own large-scale winter offensive. However, Lieutenant Colonel William Haviland, commanding Fort Edward, where the rangers were based, disclosed the secret operation to the whole garrison. After a desertion and the capture of a servant by a French and allied native raiding party, Rogers believed the plan had been seriously compromised. Haviland's response was to reduce substantially the size of the 400-man force Rogers had hoped to employ.

Rogers left Fort Edward with 183 men on March 10, 1758, marching north along Lake George. Passing the ruins of Fort William Henry and pausing to further investigate a supposed enemy encampment, the rangers reached a point very near Fort Carillon. Rogers abandoned his more ambitious plans of taking Fort St. Frédéric and, on March 13, 1758, laid an ambush for the morning patrol leaving Fort Carillon.

Sighting a party of 96 Frenchmen, Canadians, and Nipissing, Iroquois, and Abenaki warriors, the rangers launched the ambush at the sound of Rogers's signal gun. The rangers believed that they brought down about 40 men, but the fleeing survivors broke through the rangers' blocking force. One Ranger company pursued, but then stumbled into an ambush by about 250 French and natives. The French had indeed been warned, and the party the rangers had first sighted was only the advance guard of a much larger force.

The rangers fell back, losing about 50 men in the retreat until reaching defensible ground. The French forces then outflanked the rangers' position, and Rogers lost another 50 to 60 men during a further retreat. Many of the rangers abandoned their new green uniform coats, perfect for summer forest warfare but now all too visible against the snow. They fought on in shirt sleeves, cold but better camouflaged.

One of Rogers's flank parties was surrounded and forced to surrender on terms of personal safety and quick repatriation. The surrender terms were not honored, however. Many of the captured were executed or taken to Canada. At the same time, the rangers' ill-manned front collapsed when the French and native warriors, determined to finish the battle by dark, again attacked.

Rogers ordered the remaining rangers to scatter into the gathering dusk. During the evening, French forces captured or killed more rangers. Others became lost in the snow-filled woods.

The surviving rangers regrouped around their supply sleds and returned to Fort Edward. Their defeat and casualties stunned the garrison. Some 130 rangers died in the battle. French and Native American casualties were disputed, but were probably only on the order of 20 to 40, killed and wounded. The French briefly believed Rogers to have been among the dead, as his coat was found on the battlefield. As disheartening as the defeat was, the rangers recovered from this unaccustomed setback to serve capably and famously in future British operations.

Sokokis

Native American people belonging to the larger Abenaki Nation. The Sokokis' western Abenaki territory covered an area in the northern Connecticut River Valley, roughly between present-day Northfield, Massachusetts, and Bellows Falls, Vermont. Before European contact and a series of epidemics in the 16th century, there were 20,000 eastern, 10,000 western, and 10,000 Canadian Maritime Abenakis. In the decade prior to English settlement of Massachusetts in 1620, three epidemics killed 75 percent of the eastern Abenaki. The Sokokis, who were more isolated, lost about half of their original population of 10,000 people. They regained some of this by absorbing southern New England Algonquins, but by the time of the American Revolutionary War, the Abenakis numbered little more than 1,000 people.

Like other Abenakis, the Sokokis grew corn, beans, and squash. They also hunted, fished, and gathered. Where the soil was poor, they used fish to enrich it. They lived in oval longhouses or wigwams, depending on the season. Until 1670, all Abenakis organized at the tribal level. After that time, they established the Abenaki Confederacy in response to ongoing war with the English and the Iroquois.

732 Sons of Liberty

The Abenaki-French fur trade began in 1604, but it faded because of perennial French-English disputes. The Abenakis first encountered the English at the Kennebec River in Maine in 1607, at which time they counted the Pemaquid as their allies. Other Sokoki allies included the Mahicans and the neighboring Pennacooks, who were the first to deal with the English extensively.

When the Mohawk attacked the Sokoki in 1629, the French and English ignored Sokoki-Pennacook pleas for help. Another outbreak of smallpox hit New England in 1633–1634, further reducing Sokoki numbers. By 1637 the Sokokis possessed firearms and demonstrated a willingness to trade. However, most traders did not wish to encounter the Mohawks, who were still on Sokoki territory.

As it turned out, the Sokokis found themselves tied to the French. The French had better resources, and the English, for their part, did not trust New France's native allies. In 1642, the Sokokis allied with the Mohawks and Mahicans against the Montagnais in an effort to monopolize trade with the French.

In 1650, the French and Sokokis formed an abortive alliance against the English-allied Mohawks. They also had sought alliance with other New England natives. The Mohawks fought additional wars with the Sokokis until 1658, by which time the English had taken Port Royal and isolated the Sokokis from the French. By 1670, because of the ongoing French/Sokoki–English/Mohawk conflicts, most Sokokis were refugees under French protection living along the St. Lawrence River. The Abenakis migrated to and from Canada in the 18th century before finally settling on a reserve in northern Maine at century's end. The Sokokis fought on the French side against the English during the imperial wars of the 18th century, participating in the 1704 attack on Deerfield, Massachusetts.

Sons of Liberty

Political protest group among British colonists that formed out of the popular backlash to the Stamp Act (1765). The Sons of Liberty originated with the Loyal Nine, a Boston social group that organized demonstrations in that city against royal policies. Inspired by their example, similar groups appeared from Portsmouth, New Hampshire, to Charles Town (present-day Charleston), South Car-

British cartoon showing a club-wielding mob of "liberty men" forcing a Virginia Loyalist to sign a document. To the side, a man is being led toward a gallows, from which hang a sack of feathers and a barrel of tar. (Library of Congress)

olina, communicating with each other and coordinating Stamp Act resistance until its repeal in 1766.

Colonel Isaac Barré, a Whig member of Parliament who argued against colonial taxation, dubbed the dissenting colonists the "Sons of Liberty." The Loyal Nine readily adopted the sobriquet as their own in December 1765, and they encouraged other Stamp Act resistance clubs to identify themselves as such.

The methods of the Sons of Liberty were typical of mob actions in 17th- and 18th-century America. These included boisterous public demonstrations, the intimidation and assault of royal officials and political opponents, and the destruction of public and private property. They also spearheaded public ridicule of parliamentary supporters in the form of newspaper attacks.

Many of the Sons of Liberty's protest methods were borrowed from New England's raucous annual "Pope's Day" festivities, which coincided with England's Guy Fawkes Day, celebrated on November 5. Crowds gathered around processions carrying effigies of the pope, which they burned amid general anti-Catholic revelry. During the Stamp Act riots, protesters similarly abused effigies of stamp distributors and assorted royal officials. However, the Sons of Liberty were best known for their practice of tarring and feathering their inveterate enemies. Although the Sons of Liberty were successful in preventing the Stamp Act from being implemented and were largely responsible for its repeal, they did not disband in 1766. Rather, they

remained vigilant and active in the defense of American liberties throughout the pre–American Revolutionary War period.

The term "mob" usually equated with the lowest orders of society in the 18th-century English mind. Nevertheless, in both Britain and, especially, the North American colonies, mobs were composed of a relatively broad cross section of society. John Adams, Patriot and second president of the United States, noted that the Loyal Nine was made up of artisans, merchants, and a ship's captain. The Sons of Liberty also included laborers, professionals, and the gentry, the latter providing the overall leadership. Consequently, the Sons were assiduously disciplined in their approach. On the whole, they did not randomly target individuals, kept violence to a minimum, and very carefully directed property damage.

Excesses did occur, however, prompting Adams to lament in a letter to his wife Abigail, "These tarrings and featherings, this breaking open Houses by rude and insolent Rabbles, in Resentment for private Wrongs or in pursuance of private Prejudices and Passions, must be discountenanced." Some individuals certainly camouflaged their pursuit of personal agendas in the cloak of the Sons of Liberty's protest activities. Yet the Sons of Liberty as a whole committed themselves to popular mobilization against British policies that had been deemed tyrannical. By propagating libertarian principles on an intercolonial scale, the Sons of Liberty contributed to the politicization of the American populace so as to make broad support for the American Revolution possible.

Soto, Hernando de

Born: ca. 1496 Died: May 21, 1542

Spanish explorer and conquistador, credited with having discovered the Mississippi River. Hernando de Soto was born about 1496 in Jerez de los Caballeros, Badajoz, Spain, and led a Spanish military expedition (entrada) into what is now the southeastern United States from 1539 to 1542. His expedition firmly established Spain's early claim to the region and devastated many of the Native American populations that inhabited it. De Soto had earlier been one of Francisco Pizarro's lieutenants during Pizarro's conquest of the Incan Empire. After he had been appointed governor of Cuba in 1535, de Soto undertook the conquest of Florida at his own expense in hopes of surpassing the success of Pizarro's exploits and gaining additional wealth and fame.

Spanish conquistador Hernando de Soto explored the southern part of North America. He is credited with being the first European to discover the Mississippi River. (Library of Congress)

On May 30, 1539, de Soto's force of 1,000 men and a few hundred horses and a herd of swine landed at Tampa Bay, Florida. The Spanish then headed north into the interior Southeast. Over the next three years, de Soto's men were almost constantly fighting because of their brutal treatment of the natives they encountered. Usually, de Soto followed the tactics of seizing the leader whenever he met a new group of natives. Holding their leader hostage, de Soto would then force the natives to provide him with bearers to carry the expedition's supplies. He also took whatever food supplies he needed. Often, the Spaniards left a region physically devastated. They ravaged women, consumed scarce food supplies, tainted water with human and animal wastes, and killed many native warriors. De Soto's brutality provoked one of the largest native-European battles in North America when the Choctaws attacked the Spaniards at Mabila on October 18, 1540.

In 1541, de Soto's expedition traveled through the modern-day states of Alabama, Arkansas, Florida, Georgia, the Carolinas, Mississippi, Tennessee, and parts of Texas. During his trek westward and then back east, de Soto is believed to have "discovered" the Mississippi River. De Soto was stricken with a fever and died on May 21,

1542, somewhere along the Mississippi River in present-day Louisiana. By this time, after almost three years of near-constant hostilities, his force was only a shattered remnant of its former self. De Soto's successor, Luis de Moscoso de Alvarado, buried his chief's body in the Mississippi River so that local natives would not find it and learn that the Spanish had lost their leader. The expedition then floated down the Mississippi on makeshift rafts while under constant native attack. The survivors finally made it to Mexico.

South Carolina

Carolina was chartered as a proprietary colony in 1663, the first of the Restoration colonies in British North America. The first colonists settled in two distinct regions: near Albemarle Sound south of the Virginia border, and at the confluence of the Ashley River and Cooper River, near modern-day Charleston. The colony was originally referred to as "Carolina" and extended roughly from the Virginia border south at least to the Savannah River, if not farther south. In 1719, Carolina was formally split into two colonies, North and South Carolina. South Carolina then became a separate colony under direct royal control. North Carolina remained a proprietary colony until 1729.

Carolina's first system of government included an expansive nobility and encouraged large land grants to wealthy individuals. Edicts of religious toleration and grants of "headrights" to self-financed immigrants encouraged English subjects to move into the region. The early Carolina economy revolved around the fur trade, with thousands of deerskins traded by Native American hunters for export every year. The area did not develop a staple crop until the introduction of rice in the 1690s, although large cattle plantations supplemented the fur trade. Once rice became a common commodity in the colony, the development of large plantations relying on African slave labor became increasingly common, particularly in the southern reaches of the colony.

As colonists in the Charles Town (present-day Charleston) region of Carolina pushed westward, conflict with neighboring Native Americans became increasingly common. This conflict was

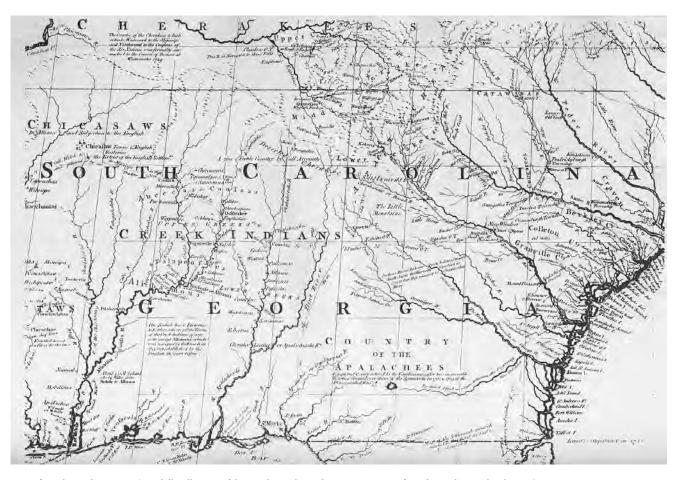

exacerbated by the colony's burgeoning Native American slave trade. From 1670 to 1715, between 30,000 and 50,000 native slaves were sold in the Charleston market. Colonial slave traders rarely captured slaves themselves. Typically, they relied on trading relationships with friendly tribes to supply the market. By manipulating tribal rivalries and the desire of native populations for colonial trade goods, English colonists profited handsomely from tribal conflict. In most ways, the Carolina Native American slave trade resembled the African slave trade. It relied on predatory raids by coastal tribes armed with European weapons, who brought thousands of enemy captives into Charleston. These slaves were primarily sent to the West Indies, although a significant number were shipped to other English colonies on the continent. A few were maintained in South Carolina for plantation labor. Carolina was the only English colony to actively pursue the native slave trade on a long-term basis.

The earliest native slave trading in Carolina relied on the Westo Nation, which was given a monopoly charter by the proprietors of the colony in 1670. The first 10 years of the trade sent profits back to the proprietors in London but did little for the colonists in Carolina beyond angering regional Native Americans. In 1680, colonists armed a group of Shawnees who had recently moved to the area and offered them extensive trade goods if they conquered and enslaved the Westos. By 1683, the Westos had been thoroughly destroyed by the aggressive Shawnees, and with their destruction, the proprietary monopoly dissolved.

After the destruction of the Westos, Carolina slave merchants armed the coastal Savannah natives, who replaced the Westos in the slave economy and ranged hundreds of miles on slave raids into the interior and along the Florida coastline. When the Savannahs decided that they had become too dependent on the slave trade, they decided to end their relationship with the Carolina slave merchants and migrate north. In response, Carolinians offered gifts and bounties to the Catawba tribe to annihilate the Savannahs, continuing the pattern of internecine tribal warfare promoted by English colonists.

When Tuscarora warriors attacked Carolina settlements in the Albermarle Sound region in 1711, sparking the Tuscarora War (1711–1713), colonial militia forces from the Charleston region assisted in the counterattack. Throughout the conflict, slave traders from South Carolina conducted raids on Tuscarora settlements, almost always relying on help from native allies to bolster their forces. The most helpful allies to the Carolina colonists during the war were the Yamasees. But tensions between the native allies and the Carolinians led to a falling out with the Yamasees, who deserted with their captives and returned home.

By 1715, the Yamasees were heavily in debt to Carolina merchants, who seized a number of women and children as slaves in payment of the debt. The Yamasees organized a loose confederation of regional tribes and attacked English settlements in the Charleston region, sparking the Yamasee War (1715–1717), which killed hundreds of white colonists. In traditional fashion, the Carolina settlers looked to a local native tribe, the Cherokees, for assis-

Map of South Carolina, 1755. (Kendall Collection of the South Carolina Library, University of South Carolina, Columbia, SC)

tance in facing the superior numbers of the Yamasee confederation. In exchange for trade goods and weapons, the Cherokees entered the fight. Gradually the Yamasees were pushed back into Florida, where they were virtually annihilated.

Carolina was also affected by the sporadic colonial wars fought in the New World by European powers. In particular, Queen Anne's War (1702-1713) demonstrated the dangers faced by Carolina as the southernmost English colony, bordered by Spanish Florida. The war was an outgrowth of a simultaneous European war, the War of the Spanish Succession. On September 10, 1702, the colonial legislature opted to invade Florida, hoping to capture St. Augustine. The assault fared poorly, as 500 colonial militiamen and Chickasaw warriors failed to capture the fort there. They did, however, burn the town of St. Augustine. Minor skirmishes followed in 1703, and in 1704, Gov. James Moore Jr. led another invasion that threatened French Louisiana. It was turned back, however, by a mixed force of French and Spanish troops and Choctaw allies. In 1708, a combined French and Spanish expedition attacked Charleston but failed to take the town. The final five years of the war in the region were characterized by occasional skirmishes.

During the French and Indian War (1754–1763), South Carolina colonists fought the Cherokees over trading rights and the question

of sovereignty. In 1755, the Cherokees recognized the English king as their sovereign, and supplied warriors for the western frontier of Virginia. However, when they were not paid for their services, they deserted and plundered colonial settlements while returning home. A series of skirmishes between the Cherokees and South Carolina settlers ensued, culminating in a 1759 invasion of Cherokee lands by the South Carolina Militia. In 1760, Cherokee warriors captured Fort Loudoun, the largest English outpost on Cherokee land. In 1761, a mixed force of British regulars and local militia targeted villages and food supplies. The Cherokees were now forced to submit once more to English authority.

From 1763 to 1775, the English government actively courted the Cherokees to serve as a check against the radical designs of American patriots. During the American Revolutionary War, the Cherokees provided warriors for the British cause. More battles of the American Revolutionary War were fought in South Carolina than in any other state. Indeed, it was the site of some of the most brutal fighting between Patriots and Loyalists. It was also the scene of the pivotal battles of Charleston (May 12, 1780), Camden (August 16, 1780), Kings Mountain (October 7, 1780), and Cowpens (January 17, 1781).

Spain

For three centuries from the voyages of Christopher Columbus at the end of the 15th century, Spain possessed the world's most extensive overseas empire. For much of this period, Spain also maintained a powerful navy, and its army was among the best trained and most feared of those of European states. Spain's early success in empire building, however, brought confrontation with other states that also sought to carve out overseas empires in the Americas and Asia. Initially, Spain's chief rival was Portugal, but other antagonists soon appeared in the English, the Dutch, and the French.

By 1500, Spain was well positioned to lead European expansion in the New World. Geographically, it was closer to the New World than any other colonial power, save Portugal. It also had a long commercial and seafaring tradition based on extensive trading with Africa, the islands of the Mediterranean, and with other European states. In addition, Spain had resolved its internal divisions and emerged as a unified state ready to assume foreign challenges.

In 1492, Spanish troops under King Ferdinand of Aragon and his wife Queen Isabella of Castile conquered the Kingdom of Granada, ending centuries of Moorish (Muslim) power on the Iberian Peninsula. That same year Genoese mariner Christopher Columbus secured funding from Ferdinand and Isabella for a voyage westward to reach Asia. The voyages of exploration were fueled by the desire of Spanish leaders to secure a direct trade with China and other Asian markets without having to go through Muslim middlemen. Because an earlier treaty with Portugal prohibited Spanish competition on the southerly route to Asia around Africa, Spanish leaders sought a western route.

Prior to its unification, Spain had been a handful of small states, so there was little sense of a Spanish identity. That identity came through the Catholic Church. To be Spanish was to be Catholic. Missionary zeal and the desire to see Catholicism triumph everywhere were both motives and ready justifications for Spain's expansionary impulses.

Contemporary illustration showing the troops of Hernán Cortés assaulting Tenochtitlán. (Wildside Press)

In 1492, Columbus "discovered" America and initiated Spanish colonization of the Americas. Spain first secured the Caribbean islands. Spaniards settled Hispaniola in the early 1500s; from there, Juan Ponce de León acquired Puerto Rico and Diego Velásquez took Cuba. Major Spanish settlements on these islands followed. Spanish rule was hardly benign, for the settlers enslaved the native populations, which in any case quickly succumbed to European diseases against which they had no immunity.

In 1512, Vasco Núñez de Balboa established the first Spanish settlement on the mainland, at Darién in Panama. Numerous small expeditions of Spanish explorers soon fanned out throughout the New World, in the process opening up vast new territories to exploitation and colonization. These warrior-explorers were known as conquistadors. More concerned with the quest for riches than with colonization or religious conversion, their appetites were fueled by the discovery of rich deposits of gold and silver.

Although the native populations vastly outnumbered the conquistadors, success was made possible by European firearms and horses, both of which the natives had never before seen. The Spaniards were also fortunate in encountering the Aztec and Inca Empires when they were already in decline. Internal dissension and alliances with tribes that had been enslaved by the Aztecs and Incas also aided the Spanish, as did European diseases such as smallpox from which the natives had no immunity.

Perhaps the most successful of the conquistadors was Hernán Cortés. During 1519–1521, allying himself with American Indians opposed to the Aztecs, he led a relatively small force in the defeat of the once powerful Aztec Empire, bringing what became modern Mexico under Spanish control. To the south, Francisco Pizarro

destroyed the Inca Empire in what became Peru. Rumors of fabled cities of gold (Quivira and Cibola in North America and El Dorado in South America) led to a series of other expeditions. Although unsuccessful in finding riches, they did bring Spain considerable additional territorial claims.

The gold and silver of America became the chief source of Spanish wealth and power. Soon the Spaniards were shipping vast amounts of these precious metals across the Atlantic (one source estimates this trade from 1500 to 1650 at 181 tons of gold and 16,000 tons of silver). Over reliance on this mineral wealth, the failure to build an infrastructure in Spain itself, and overly ambitious government spending on maintaining Spain's international position and a vast Catholic military crusade all contributed in the long run to the ruin of Spain. Local industry declined as Spain used its wealth to buy finished goods from abroad. Manual work was held to be a sign of inferior social status and catastrophic inflation set in.

Increasingly the Spanish economy became dependent on the regular arrival of the treasure ships. At the same time, however, that economic lifeline came under attack from state-sponsored piracy encouraged by the Dutch, French, and above all, English governments.

The Spanish monarchy ignored the signs that pointed to the need for reform, and in the short run all seemed well. Indeed, the 16th and 17th centuries came to be known in Spanish history as the *Siglo de Oro* (Golden Age). Spain's vast empire included much of the Americas and extended to the Philippines in Asia.

At the same time that Spanish explorers were creating a vast overseas empire, Spain itself had embarked on a great military effort in Europe. The motivations here were to defend Europe against the threat posed by the Ottoman Turks, but also to maintain and expand Spanish influence throughout the continent and above all to crush the Protestantism espoused by Martin Luther in Germany. King Charles I (1516–1556; Holy Roman Emperor Charles V, 1519–1556) was as near a universal monarch as Europe had seen in a long time or would see again until Napoleon. In 1525, in a decisive encounter, Charles's armies defeated French forces in Italy at Pavia, even taking as prisoner French king Francis I. Charles also waged extensive warfare with the Protestant princes of Germany, but was unable to crush them and indeed was obliged to conclude peace with them in 1555 at Augsburg.

Disheartened by his efforts, Charles abdicated his many crowns and retired to a monastery in 1556. His and Spain's vast crusade reached its peak under Charles's son and successor, King Philip II (1556–1598). With religious zeal and grim persistence, Philip poured all his nation's resources into the vast religious enterprise of advancing the Catholic faith. At first he enjoyed success, defeating the Turks at sea in the Battle of Lepanto in the eastern Mediterranean in 1571, but Philip experienced a major failure in his efforts to subdue England.

War with England had come about in consequence of a revolt in the Netherlands against Spanish rule. Queen Elizabeth I of England (1558–1603) provided assistance to the Protestant Dutch—at first

Vasco Núñez de Balboa wades into the Pacific Ocean in 1513, claiming it for King Ferdinand V of Castile. Nineteenth-century drawing by H. Vogel. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

covertly and then openly in the form of an expeditionary force—while at the same time English freebooters such as Sir Francis Drake attacked Spanish treasure ships on the high seas. Determined to crush England, Philip in 1588 sent his powerful Armada to the English Channel, only to meet humiliating defeat in the form of English warships and a great storm (the "Protestant Wind").

This rebuff at the hands of the English did not at the time seem seriously to weaken Spanish power, but in retrospect it was a major turning point that marked the beginning of the rise of England as a major international force. Spanish troops also invaded France in an unsuccessful effort to prevent Henry of Navarre from becoming king. The Netherlands, meanwhile, had become a bloody quagmire. All of this drove the Spanish government to declare bankruptcy in 1596. Finally, in 1609 Spain signed the Twelve Years' Truce with the United Provinces, bringing to a temporary end the fighting in the Netherlands.

The conclusion of the truce provided an opportunity for the Spanish government to get the nation's economic house in order and scale back commitments to meet revenues. Spain needed peace to be able to reform, but it was not to be. In 1618 fighting again broke out in Europe, producing the conflagration known as the Thirty Years' War (1618–1648). In 1621, warfare also resumed in the Netherlands.

For a time, it appeared as if the Catholic powers might prevail. Finally, for reasons of sheer realpolitik, France entered the fighting openly on the side of the Protestants and against Spain. The French shattered the seemingly invincible Spanish infantry in the Battle of Rocroi in 1643, ending the long period of Spanish military greatness.

On the seas, the Spanish Navy was unable to resupply adequately the nation's troops in the Netherlands, and Spain was forced to make peace with the Netherlands and recognize its independence. War with France continued even after the Peace of Westphalia in 1648 that ended the Thirty Years' War. Not until the Peace of the Pyrenees in 1659 was peace with France achieved, but with the Spanish ceding territory to France.

To add to Spain's woes, Portugal rebelled in 1640. Spanish efforts to subdue Portugal failed, and Spain finally recognized its independence in 1688. Lost along with Portugal was Brazil.

In 1700, King Charles II, the unfortunate product of Habsburg inbreeding, died childless and unlamented. During the last year of Charles's sad life, King Louis XIV of France won the commitment that the entire Spanish inheritance would pass to the French king's grandson. Even the ambitious Louis must have hesitated at the prospect, for this decision touched off the War of the Spanish Succession (1702–1713). Known in English America as Queen Anne's War, it has also been called the first world war, for fighting occurred all over the globe as France and Spain stood against much of the rest of Europe.

The war ended in the Peace of Utrecht of 1713. Bourbon Philip V was confirmed as king of Spain with his American possessions, but Spain was forced to cede considerable possessions in Europe. Britain retained both the island of Minorca and Gibraltar. Spain was also forced to cede to Austria its possession of the Spanish Netherlands.

Although the Bourbon monarchy did bring reform to Spain in the form of centralization, the introduction of mercantilist principles, and the creation of departments of the army and navy, these came too late to reverse completely the decline brought on by generations of neglect. Throughout much of the 18th century, Spain remained closely tied to France—the so-called family compact—even following that nation into war against Britain in the American Revolutionary War.

As noted, the Spanish overseas empire directly impacted developments in Spain itself. Columbus had sailed under the aegis of Castile, and the new lands passed under its control. At first on the mainland, Spain had allowed those conquering the land to control it under royal patent, but within a few years the Crown moved to consolidate its control over the newly acquired lands and remove the conquistadors from ruling positions. By the 1570s all the machinery of government in the colonies was firmly in place. As early as 1503 and the beginning of trade with the West Indies, the government created the Casa di Contractación at Castile. By the 1530s, a new body, the Conseillo de Indias (Council of the Indies) had full executive, judicial, and ecclesiastical authority in the Indies and over the Casa di Contractación. Other institutions came into being to control the movement of the Spanish Army and fleets.

In 1542, the Crown created two viceroyalties. That of Peru with its capital at Lima had authority over all of Spanish South America, save Venezuela, extending north to include Panama. The viceroyalty of New Spain, with its capital at Mexico City, had authority over all Spanish territory north of Panama, as well as the West Indies,

Venezuela, and the Philippine Islands. The two viceroyalties, as the direct representatives of the Spanish sovereign, had wide-ranging civil and military as well as some ecclesiastical powers.

Beneath the viceroyalties, the empire was further divided into *audiencias* (literally "law courts"), a combination of a legislature, cabinet, and court that drafted laws, advised the viceroyalty, and conducted major judicial proceedings. The king appointed the members of the *audiencias*. The governing structure in the colonies was intended solely to safeguard the power and wishes of the government in Spain, which approved all major decisions.

The Catholic Church enjoyed considerable influence in the colonies. The conversion of natives was always held to be a prime motive for Spain's conquests, and priests accompanied the conquistadors and explorers in their travels. Missions soon sprung up throughout the viceroyalties of New Spain and Peru.

The Crown rigidly controlled emigration, only allowing Catholics in good standing to settle in the New World. The vast majority of settlers came from the territories of Castile. A number of nobles emigrated to the New World, including many younger sons seeking adventure and wealth denied them by inheritance laws in Spain.

During the initial conquests, the Spanish had enslaved the natives, but the New Laws of 1542–1543 prohibited this, making the natives wards of the Crown. The beneficent attitude of the Crown was, however, to a considerable measure negated by the actions of individual administrators, although many Spaniards attempted to act as advocates for the native peoples. Spanish treatment of the native populations, which has come under considerable condemnation, was in fact outdone by the English treatment of African slaves in the Caribbean. The Spanish much resented the English perpetuation of the so-called black legend. The English held that their own rule was more benign than that of Spain and used it to justify their own acquisition of Spanish territory.

The Spanish Crown also introduced African slavery, although chiefly in the West Indies and in northern South America. With its large tracts of land suitable for settlement and cultivation, Mexico was the primary place of settlement. The number of immigrants grew rapidly and by 1574 were estimated at 160,000 people. Intermarriage between Spaniards and the native population produced a caste known as mestizos. Upper-class Spaniards possessed virtually all of the colonial wealth.

Spanish colonial expansion to the north in the present-day United States came both in the West from New Spain, and along the Gulf Coast and in Florida and the Carolinas. In the West and operating from New Spain, legends of the fabled Seven Cities of Cibola, prompted expeditions northward. In 1539, Franciscan Fray Marcos de Niza reached the Zuni pueblos. The next year Francisco Vásquez de Coronado led another northern expedition, while Hernando de Alarcón proceeded by sea along the West Coast. Coronado reached the Zuni pueblos, and his lieutenants traveled as far as the Grand Canyon of the Colorado River. Coronado then explored present-day northern Texas, Oklahoma, and eastern Kansas before returning south in 1542.

During 1598–1608, Spain established its control over New Mexico. Explorers also traveled into Kansas and up the Pacific Coast of present-day California. In 1535, Cortés attempted to establish a colony in Baja, California, and by the mid-1540s the Spanish had explored as far up the Pacific Coast as Oregon.

In 1680, a revolt of the Pueblos drove the Spanish from New Mexico, although they reestablished their control there in 1696. Meanwhile, the Spanish extended their exploratory efforts into Florida and the Great Plains of present-day New Mexico, Arizona, Texas, and California.

During 1720–1722, contesting the area with the French, Spain established its control over present-day Texas, and during 1769–1786, small Spanish forces took upper California, including San Diego (1769), Monterey (1770), Los Angeles (1781), and San Francisco (1776). The Spanish established a series of presidios (fortified outposts) and missions run by the Franciscan order.

To the east, in 1521 Juan Ponce de León attempted without success to colonize Florida. During 1526–1528, Lucas Vásquez de Ayllón established a colony in the Carolinas, but it was abandoned on his death. That same year, 1528, Pánfilo de Narváez arrived in Florida with colonists from Spain. Trying to reach the area of the Pánuco River, the members of the expedition were shipwrecked, with most dying of hunger or disease or at the hands of the natives.

In 1539, Hernando de Soto arrived in Florida from Spain at the head of a sizable force of 600 men, then proceeded to explore much of what is today the southeastern United States. In 1541 the members of his expedition were the first Europeans to see the Mississippi River. De Soto then traveled as far west as present-day Arkansas and Oklahoma before descending the Arkansas River to the Mississippi. De Soto died in 1542 during the subsequent passage down the Mississippi, although members of his expedition did reach the Pánuco area the next year.

In 1559, the Spanish sent out a large expedition under Tristán de Luna to colonize the Carolinas. Luna established a post at Pensacola and then moved inland, although these colonists were later removed to Pensacola. Efforts to establish a settlement in the Carolinas met with failure and the garrison at Pensacola was also withdrawn. In 1561, King Philip II, faced with numerous previous failures, issued an order forbidding further colonization of Florida. The need for a naval base to protect the Bahama Channel used by the Spanish treasure fleets sailing to Spain, and French efforts beginning in 1564 to establish a Huguenot colony in South Carolina from which they might attack the Spanish ships, prompted Philip to reverse his earlier order. In 1565, Pedro Menéndez de Avilés founded St. Augustine in Florida, hailed today as the oldest city in the United States. Menéndez de Avilés then proceeded to capture the French settlement at Fort Caroline on the St. Johns River, killing its garrison and ending French colonization efforts in the region. During the next decade, Menéndez de Avilés expanded the Spanish settlements in Florida. Although Menéndez de Avilés was successful in securing Florida for Spain, his efforts to the north, which reached as far as present-day Virginia, failed.

Spain's success in colonization in the New World and the flow of gold and silver to the mother country early excited the colonial ambitions of other powers. These and the decline of Spain would bring a steady erosion of Spanish overseas holdings.

Spanish settlements and its trade and treasure fleets early came under attacks mounted by the French, the English, and the Dutch. French corsairs attacked Spanish ships off the Iberian coasts and in the Caribbean, where they also razed Spanish coastal towns. In the mid-16th century, the English Crown encouraged freebooters such as Sir Francis Drake and Sir John Hawkins to attack the Spanish treasure fleets and raid Spanish settlements. When England and Spain formally went to war in 1557, this activity intensified, creating considerable economic loss for Spain.

Spain neglected the Lesser Antilles, and in the 17th century the French, the English, and the Dutch moved into that area. The Dutch and the French also contested with the Spanish for control of Brazil, and in 1628 a Dutch fleet captured a large plate fleet sailing from New Spain. England continued to inflict heavy financial losses on Spain in the period, and in 1668 Englishman Sir Henry Morgan captured and looted Portobello in Panama.

In 1655, the English took Jamaica from Spain, retaining it. In the Treaty of Ryswick of 1697, ending the War of the League of Augsburg (King William's War in America), Spain ceded Western Hispaniola (Haiti) to France, where French irregular forces had landed during the war.

The 18th-century wars involving Spain in Europe had immense repercussions in the Americas. British control of the seas made it next to impossible for Spain to protect its colonies or to preserve its monopoly in trade. English, Dutch, and French illicit trade with the Spanish colonies increased. During the War of the Spanish Succession (1702–1713, known as Queen Anne's War in America), considerable fighting occurred between the allied Spanish and French and the English in both Florida and the West Indies. Among concessions won by the English in the Treaty of Utrecht of 1713 ending the war was the asiento (agreement), a 30-year monopoly on slave trading in Spanish America, as well as the right to send one trading ship a year to trade with the Atlantic ports of the Spanish colonies. This proved a license both for expanded English trade and illicit smuggling.

When Philip V sought to overturn provisions of the peace settlement, in 1718 Britain, France, the Netherlands, and Austria concluded the Quadruple Alliance and went to war against Spain. During 1718–1720 fighting took place in both Europe and the Americas, during which Spain abandoned its claims in Italy. In fighting with France in Florida and Texas, however, Spain secured its hold over Texas.

Reforms under the Bourbon monarchy led to successful Spanish defense of its overseas possessions in the Anglo-Spanish War (War of Jenkins' Ear, 1739–1744), which merged into the War of the Austrian Succession (1740–1748). In the New World, considerable fighting occurred along the Georgia-Florida border and in Florida, where Spain retained its hold. The Spanish also turned back

a powerful British naval expeditionary assault on Cartagena (Colombia). The resultant Treaty of Aix-la-Chapelle produced no important colonial transfers.

This was not the case during the French and Indian War (1754–1763). Spain entered that war in 1761 as an ally of France. The following year, British expeditionary forces captured both Havana and Manila. By the Treaty of Paris ending the war in 1763, in return for the restoration of Havana and Manila, Spain ceded all Florida to Britain. To compensate it for the loss of Florida, France transferred to Spain control of Louisiana, although this met some opposition from French colonists there.

Convinced that Britain was determined to take all of Spain's New World colonies and that a showdown with Britain was inevitable, Spanish king Charles III (1759–1788) oversaw a series of military, fiscal, and administrative reforms both in Spain and the colonies to prepare for the inevitable. In 1779, Spain entered the American Revolutionary War on the side of France (but not the Patriots) in America. Spanish forces captured Mobile and Pensacola and the Bahamas and blocked British efforts to secure the Mississippi. Under the terms of the peace in 1783, Spain relinquished the Bahamas but regained Florida.

During the Napoleonic Wars, Spain lost Trinidad to Britain and was forced in 1800 to return Louisiana to France. Despite its pledge to Spain not to cede that territory to any other power than Spain, France then sold Louisiana to the United States. Considerable pressure from the United States then led Spain to sell Florida to that nation (1819–1821).

The loss of Spain's northern territories in the New World was perhaps inevitable. Its scattered settlements, missions, and forts in the territory it claimed north of Mexico were never adequately supported, in large measure because the Crown was already overextended in Central and South America. In addition, Spain's concomitant decline in power in relation to other European states conspired against a major effort in North America.

The Spanish Latin American colonies, meanwhile, largely cut off from the mother country during the Napoleonic Wars, broke away from Spain in a series of wars of liberation in the 1820s. The final blow to Spanish imperial power came at the hands of the United States in the Spanish-American War of 1898.

Spain, Army

The Spanish Army at the beginning of the 16th century was the preeminent European military force. This military might was forged in the crucible of the long fighting against the Moors (the *reconquista*) that culminated in the defeat of the latter in 1492. The ascension of King Charles I (Holy Roman Emperor Charles V) to the Spanish throne in 1516 signaled the beginning of Spain's renewed interest in European affairs and the exploration of the New World.

The Spanish Army in New Spain was never a large enough force to be able adequately to perform its duties of defending colonists, trade routes, mines, missions, and launching punitive expeditions against the natives. In addition to threats from natives, the army had to defend against the threat posed by the militaries, both regular and militia, of the other European colonial powers.

In large part because of Spain's extensive commitments in Europe and ongoing wars there, the number of Spanish professional soldiers in the New World was always small and had to be supplemented by militia and native allies. Beginning with Hernán Cortés in 1519, the army was supplemented by native auxiliaries who acted as scouts, bearers, and soldiers. For at least two centuries, until reforms under the Bourbon kings in the 18th century, there was never a large standing army in New Spain. When Spanish holdings were threatened, the government sought to recruit colonists (usually males ages 16 to 40) into local militias, provincial militias, city militias, and coastal guards. In 1570, the Chichimec War finally prodded the viceroyalty into forming the beginnings of a professional standing army in New Spain.

The basis of Spanish defense in the New World was the presidio. Usually built along trade routes, near settlements, mines, and other strategic locations throughout the realm, presidios were strong, fortresslike structures built to withstand assaults and sieges and to serve as secure way stations along trade routes for traders and travelers. They also often served as protection for nearby Catholic missions. The presidio was meant to serve as a bulwark against Native Americans as well as against the incursions of European foes. Garrisons numbered from as few as 6 soldiers to between 50 and 75 men. At first, the garrison settlements consisted of single men, but soon wives and families joined the soldiers. Over time, settlers, merchants, and missionaries settled near presidios for protection.

The presidio also acted as a contact point between natives and the Spanish and as a de facto native agency. The members of the garrisons came from the surrounding region and were not part of the regular Spanish Army. Their pay was both low and sporadic. The major weaknesses of the presidio system were the isolation of each post from one another and the lack of a unified command. Presidios were separated by many miles and unable to support each other in times of attack, a problem that the Spanish colonial government never adequately addressed. The Crown attempted to remedy the weaknesses of the presidio system with two major reforms—the Reglamentos (Regulations) of 1729 and 1772.

A five year inspection tour of the presidios by Spanish general Pedro de Rivera led to the Reglamento of 1729. This Reglamento was issued in response to soldiers being deprived of their pay and with the plan of closing unnecessary presidios. It restructured pay, brought the closure of some presidios, and established regulations for the internal workings of the presidios in order to standardize command and discipline. These cost-cutting measures did nothing to rectify the inadequacy of troop strength or the lack of communication and tactical support.

The Reglamento of 1772 was a more serious and ambitious attempt at addressing the inadequacies of Spain's frontier defenses. This Reglamento, proposed by Marshal Marquis de Rubi, proposed ceding control of lands not effectively occupied by Spain back to the natives. To Rubi this meant anything north of the Rio Grande River. Aside from isolated settlements in San Antonio, Texas, Santa Fe, New Mexico, and small and scattered colonies in California, Rubi was effectively yielding up control over most of Texas, New Mexico, and California. Rubi sought to protect the Mexican heartland of New Spain at all costs. This was to be accomplished with a line of 15 presidios stretched across northern Mexico from the Gulf of California to the Gulf of Mexico. These would be 100 miles apart, supposedly within easy communication and support range. The proposal was also a cost-cutting measure, as many presidios within and outside the line were to be closed.

Rubi also proposed allying with the Comanches and the Caddoes instead of the Apaches. In addition, the 1772 Reglamento placed presidio troops on equal footing with the regular army with the same discipline, pay, promotions, and equipment. The regulations standardized the strength of companies, pay, weapons, uniforms, and training among all Spanish soldiers. The pronouncement also set forth qualifications for captains and set uniform policies toward Native Americans. The Reglamento called for the appointment of an inspector general, and, for the first time, all presidios would be under a single command, that of the commandant of presidios.

King Philip II (1556–1598) greatly expanded Spanish military strength and embarked on a series of conflicts to expand Spanish influence and conquest. A staunch Roman Catholic, he also fought a series of religious crusades against both non-Christians and non-Catholic Christians. As the preeminent Catholic monarch and the possessor of a kingdom that included Spain, Portugal, much of Italy, the Netherlands, and lands in the New World, Philip saw Spain's paramount role as the protector of the Catholic Church. With this role came the responsibility to spread the teachings of the Catholic Church across the globe, backed by the might of the Spanish military. As such, Philip contested a stubborn rebellion against Spanish rule in the Netherlands, conquered Catholic Portugal, and fought the Muslim Turks and the French Huguenots in Europe and in Florida. The king displayed particular enmity for the Protestant English, as English pirates with the acquiescence of the English Crown plundered Spanish treasure fleets from the New World, sinking and capturing many Spanish galleons. These attacks on Spain's wealth and the monarch's grandiose plans of conquest led to the disastrous Anglo-Spanish conflict of 1585-1588, culminating in the 1588 defeat of the Spanish Armada by the English Navy, and setting the stage for a long decline in Spanish power.

Many of Philip's wars lacked a North American component, but lasting hostility between the Spanish and the English led to a series of conflicts in the 17th and 18th centuries between the two powers that did feature Anglo-Spanish warfare in North America, including the Anglo-Spanish Wars of 1718–1721 and 1739–1744. Philip's policies in the New World saw Spain seek to consolidate and expand

its colonies in the New World, the ousting of the French from Florida, and the establishment of the convoy system to protect Spanish fleets from the predations of pirates and privateers. Indeed throughout much of the 18th century, the Spanish were continuously fending off European encroachments in Florida. Periodically, the French encroached on Texas, though they were never able to secure a foothold there.

Spain's military encounters with Native Americans were quite different from those with other European powers. The initial Spanish military advantage over natives was indeed decisive. With few men in the field, the opening military encounters with the natives of Mexico and in the region which is now the southwestern United States were decided by Spanish advantages in arms, deception, and ruthlessness. The Spanish technological advantage lay in their firearms, artillery (both of which the natives lacked entirely), cavalry, and the superb swords and cutlasses they possessed. Be that as it may, early Spanish firearms were grossly inaccurate, cumbersome, and difficult to load. Their chief advantage lay in their psychological effect.

Francisco Vásquez de Coronado's ruthless conquest of the Pueblos in New Mexico in 1536 could be considered the template for Spanish contact with the natives in the mid-1500s. After the conquest of the Pueblos, Spanish settlement in northern New Spain was widely scattered, featuring a major trade center at Santa Fe, but primarily consisting of scattered missions. For most of the late 16th and early 17th centuries, the major agent of Spanish control in the region was the Catholic Church, which founded many missions. The goal of the missions was to Christianize and "civilize" the natives. Unfortunately, the methods employed by the zealous missionaries often involved burning recalcitrant natives at the stake or other inhumane punishments. The result of the brutal nature of Spanish conquest and rule over the Pueblos was, ultimately, rebellion. The Pueblo Revolt of 1680 was the only successful native revolt in North America. For 12 years, the Pueblos of New Mexico remained free of Spanish rule until their bloody reconquest in 1692.

The heavy-handed Spanish regime ensured the hostility of the natives for the duration of Spanish rule in the region, but soon the natives were able to strike back at their Spanish overlords. The Spanish came to rule over two of the most feared and militarily proficient native groups in North America—the Apaches and the Comanches. They became more than a match for the Spanish military because they were able to increase their own military prowess. When the Spaniards first penetrated into what became northern New Spain, they had little competition from their European brethren, and the natives they encountered did not possess European arms and horses.

As time wore on, however, the French, British, and American colonists arrived at the doorstep of Spanish America, which enabled natives to procure European firearms. Furthermore, these tribes were able to harness the military advantages of the horse. In short order, the Apaches and the Comanches became expert military horsemen and marksman. Further, they were able to improve the quality of their lances, bows, and arrows and their abilities with

these weapons. Moreover, the Spanish tendency to concentrate in isolated enclaves and allow the tribes to roam the territory unfettered enabled the natives to execute lightning-fast raids against the scattered settlements with devastating results. Until the Spanish expulsion from North America, the Spanish fought a never-ending series of bloody wars with their native foes.

Spain, Navy

The Spanish Navy played an important role in the protection and exploitation of Spain's colonies in the New World. Between 1492 and 1699, Spanish naval vessels were present in only limited numbers in the Americas, primarily assigned to escorting convoys to and from Spain. During the 18th century, however, a more significant Spanish naval presence became evident. Spain established a special fleet for the New World and its colonies became significant centers of shipbuilding and naval supplies.

After the voyage of Christopher Columbus to the New World in 1492, the defense of Spanish possessions in America was left to pri-

vate individuals. In 1521, however, the Spanish government created the Carrera de Indies, a flotilla intended to protect the fleets that carried treasure from the New World to Spain. Annual convoys from Spain were accompanied by two warships that did not always continue into the Caribbean. As threats from pirates grew during the middle of the 16th century, Spanish authorities added additional convoy protection, although these were often simply armed merchant ships hired by the government.

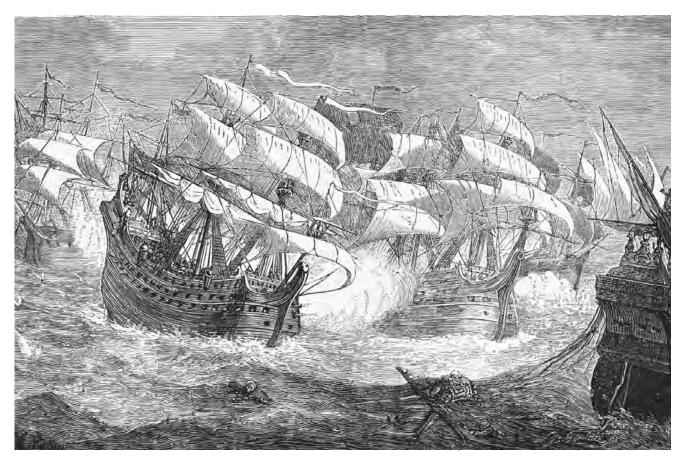

In March of each year authorities in New Spain dispatched treasure ships from the mainland. These arrived at Havana by April, waiting there while shipping from other parts of Spanish America gathered. This larger convoy and its naval escort departed Cuba for Spain before August, in order to clear the Bahamas Channel before the start of the hurricane season.

After 1561, the Spanish government organized a more systematic approach of patrols to thwart pirates and unauthorized foreign traders. Naval galleons regularly patrolled off the ports, but these proved to be too slow and unwieldy to apprehend fast pirate ships. In 1578 the Spanish government added more maneuverable galleys, suitable for shoal water operations, but they suffered from a lack of logistical support.

By 1600, Spanish naval forces in the Caribbean had been reorganized into the Armada de Barlovento, charged with securing the routes through which convoys passed. The armada received only limited material support from Spain, such as ships and sailors. Even so, it assisted in explorations of the North American Gulf Coast and Florida and supported Spanish settlements established there. The navy underwent considerable decline in the final years of the Habsburg monarchy, along with Spain itself.

Under the Bourbon ruler Philip V, however, after 1700 the Spanish Navy improved in both quality and quantity. The new monarch organized a truly national navy, the Armada Real, as opposed to naval forces maintained by various provinces. The naval bureaucracy underwent reorganization and became much more efficient. Naval construction increased, and a squadron of ships of the line and supporting vessels were permanently stationed in the Caribbean. The Spanish Navy as a whole grew from only 11 ships of the line in 1724 to 38 in 1735. By the beginning of the War of the Austrian Succession in 1740, Spain possessed 46 ships of the line.

Although fortifications provided the primary means of protection for ports in Spanish America, naval vessels played an important role in protecting the sea lanes and escorting the treasure fleets to Europe. Spain established major naval bases at both Havana and Cartagena (Colombia). Havana became a major shipbuilding center for the Spanish Empire. There the Spanish made use of tropical hardwoods, such as mahogany shipped from Central America, which proved more durable and cheaper than woods available in Europe. For most of the 18th century, Havana regularly produced one ship of the line each year. Indeed, a third of all Spanish warships came from American yards during this time. A weakness in this system was the lack of a cannon foundry in Spanish America. Completed ships had to be sailed to

Woodcut depicting the seizure of Spanish treasure ships by English ships under Sir Francis Drake. (North Wind Picture Archives)

Spain in order to be armed and outfitted before they could be pronounced operational.

Throughout most of the 18th century, the Spanish Navy remained on the defensive. The fleet's chief role was to protect the sea lanes and to ensure the arrival of the annual treasure fleet from America, the chief source of government income. The only major fleet action fought by the Spanish Navy in American waters in the colonial period occurred on October 1, 1748, during King George's War (1744–1748), when Admiral Andres Reggio with seven ships (six of 64 or more guns) fought an inconclusive battle off Havana against British admiral Charles Knowles with seven ships (six of 60 or more guns). The treasure fleet Reggio had been escorting escaped and managed to reach Spain.

A defensive stance was the only reasonable strategy given overwhelming British naval superiority in this period. In most years, the Spanish Navy was successful in convoying the annual plate fleet, as well as the many merchant ships that sailed at the same time. Between 1700 and 1763, Spanish colonial trade increased some 400 percent. Although British privateers captured some Spanish merchant ships involved in this trade during the wars of the first half of the 18th century, they were unable to prevent the convoys from sailing. British naval forces also were able to mount some successful

attacks on the Spanish colonies, but many other efforts met defeat. One of the most devastating British naval attacks on a Spanish outpost took place on November 21, 1739, at Portobello, a major trading center in New Granada (modern Panama). Employing six ships of the line in the attack, the British sent troops ashore and sacked Portobello. In contrast, a similar attack on Santiago, Cuba, in July 1741 was decisively beaten back by Spanish naval and land forces.

During the War of the Austrian Succession, which began for Spain and Britain in the War of Jenkins' Ear (Anglo-Spanish War, 1739–1744), the Spanish Navy played an important role in defending Florida and threatening the British in Georgia. In 1740, an expedition from Georgia laid siege to St. Augustine, Spain's main settlement in Florida. Spanish galleys dispatched from Cuba contributed greatly in defending the colony, eventually forcing the British to raise the siege. In the summer of 1742, the Spanish mounted an invasion of Georgia supported by some 50 vessels. Storms prevented the naval vessels from playing a decisive role, and the invasion was defeated on land in the Battle of Bloody Marsh of July 5–7.

Spanish sailors also served on land during the war, defending Cartagena against a British landing in 1740. The invading British force included many American volunteers. Approximately 3,600 Americans volunteered to join the expedition, drawn by promises of adventure, glory, and plunder. The invading force was, however, devastated both by disease and the defenses, resulting in a resounding Spanish victory.

By 1759 and the Seven Years' War (1756–1763), however, the Spanish Navy had greatly declined. When Charles III (1759–1788) assumed the throne, he undertook a naval rebuilding program. That year, Spain laid down 11 ships of the line, as opposed to only 2 in each of the preceding years. Spain took advantage of its neutrality in the war's early years to build up a sizable squadron in the Caribbean. When war began between Spain and Britain in December 1761, Spain had 19 ships of the line in that theater of operations.

The Spanish strategy of remaining on the defensive had not changed, however. The Spanish took no offensive actions prior to the British attack on Havana in June 1762. British admiral Sir George Pocock commanded a vast invasion armada of 150 vessels (13 of them ships of the line), including both warships and transports, which arrived off Havana on June 6, catching the Spanish defenders by surprise. The Spanish had 12 ships of the line at Havana, 3 of which were scuttled to block the harbor entrance. The remaining vessels were stripped of their crews and employed as floating batteries. When Havana surrendered after a 70-day siege, the British took the 9 Spanish ships of the line. Two others, building on the stocks, were burnt to prevent capture. The remaining Spanish naval vessels in the Caribbean spent the rest of the war under the safety of shore batteries. Although Havana was returned to Spanish control after the war, the losses sustained by the Spanish Navy in the Seven Years' War crippled it for years to come.

Spanish Mission System, Southeast

The Spanish mission system was an effort to convert Natives Americans to Christianity in southeastern North America. Between 1565 and 1763, the Spanish established a series of Christian missions for native peoples in the Southeast as part of their effort to control the region and protect their holdings in the Caribbean. As part of their

early missionary efforts, the Spanish, led by Pedro Menéndez de Avilés, established St. Augustine in 1565. This was a strategy aimed at driving French colonists out of La Florida, the Spanish term for the Southeast. With the removal of the French threat, St. Augustine became the cornerstone of the Spanish imperial presence in the region. In an effort to secure their control of La Florida, the Spanish turned their attention to bringing the indigenous peoples of the area into the Spanish Empire. They did this primarily through the use of military force, gift giving to local leaders, and conversion to Christianity.

By establishing control over La Florida, the Spanish Crown hoped to strengthen its claims on the area and provide added protection for the Spanish silver fleets that passed by the Florida coast headed for Spain each year. It also wanted to create a haven for survivors of Spanish wrecks that occurred frequently in the waters surrounding the Florida Peninsula.

Within 18 months of the defeat of the French at Fort Caroline in 1565, the Spanish established seven installations on the eastern coast of Florida among the Eastern Timucua and Guale Native Americans. Three bases on the western coast served the Tocobagas and the Calusas. In conjunction with the Crown's efforts to build presidios to protect La Florida, Jesuits in 1568 established the first missionary school for North American natives in Havana. The school was specifically for native children from Florida. The Jesuits then proceeded to establish missions among the native people of La Florida.

The Jesuits received a less than warm reception from the natives. On landing on the beach at Cumberland Island in modern Georgia, Timucuas clubbed a priest to death with a stone ax in September 1566. In 1568, because of Calusa attacks, Jesuits abandoned the mission called San Antonio and located at Charlotte Harbor. In the autumn of 1570, Jesuits built a mission in Santa Maria Bay (Chesapeake Bay). However, in February 1571, the local Algonquins destroyed the mission and killed the Jesuits. Only a small, native boy brought from the South Carolina coast survived to tell the tale a year later, when a Spanish ship arrived with supplies for the mission. The Jesuits finally gave up their missionary efforts in 1572.

The Jesuits failed in La Florida for several reasons. First, they did not receive the necessary financial, political, and personnel support from the Jesuit organization. Nor did they have adequate financial and civil backing from the Spanish Crown. Second, they attempted to eliminate native customs and religious practices too quickly and did not cooperate with secular authorities in La Florida. And third, the native people associated the Jesuits too closely, and incorrectly, with Spanish military personnel, who tended to abuse natives and place large demands for food on them.

The Franciscan order replaced the Jesuits in 1573. The Franciscans would play a vital role in the reestablishment of Spanish influence in La Florida. The Spanish consolidated their forces in the vicinity of St. Augustine. With the assistance of the Franciscans, they then set about gaining control of the Eastern Timucuas and the Guales on the coast of northeastern Florida and Georgia. Despite extending their control of Florida and southern Georgia throughout

most of the 17th century, the Spanish faced periodic rebellions by the mission natives. They included the Guales in 1597, 1645, and the early 1680s; the Apalachees in 1647 and 1656; the Timucuas in 1656; and the Apalachicolas (located to the northwest of Apalachee and marginally missionized) in 1675 and 1681. Nevertheless, most of the native people of Florida and southern Georgia had been exposed to Spanish culture and the Catholic Church by 1700. The most prominent groups to participate in the Spanish mission system were the Apalachees in northwest Florida, the Guales on the Georgia coast, and the Timucuas in central and northern Florida.

Throughout the mission period, native populations declined as much as 90 percent because of the introduction of European diseases and increased warfare. In the late 17th century, warfare intensified as nonmission natives acquired guns from the English in South Carolina. They then began attacking the Spanish mission groups to take and sell captives into the English slave trade. Slave raids and population loss eventually caused the Spanish to consolidate their missions in the vicinity of St. Augustine by 1706. Eighty-nine of the surviving mission natives evacuated Florida and relocated to Cuba when the Spanish ceded Florida to the British in 1763. They include some remnants of the Apalachees, the Guales, and the Timucuas.

Spanish Mission System, Southwest

By the beginning of the 17th century, Spanish missions became the principal vehicle for conquest on the frontier and the extension of Spanish influence in New Spain. Sanctioned by King Philip II's 1573 "Comprehensive Orders for New Discoveries," the mission system sought to instill spiritual and cultural control over the region's indigenous populations. Accordingly, in 1598, Juan de Oñate led an expedition from northern Mexico up the Rio Grande to spread the

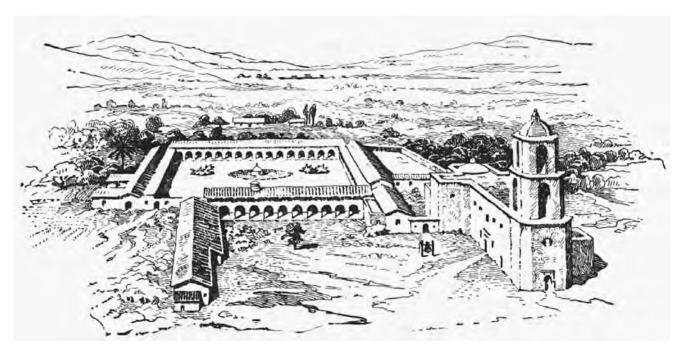

Catholic faith, pacify the natives, and establish a permanent colony in New Mexico. Oñate inaugurated his missionary program from the capital at San Juan by dispersing Franciscan friars to the Pueblos. By 1629, 50 churches functioned in the province. Missionaries strove to abolish native religious practices and inculcate the Pueblo peoples with Spanish culture and Catholicism.

To accomplish this task throughout New Spain's northern frontier, members of the Franciscan Order and the Jesuit Order sought first to form natives into self-sufficient communities under the direction of a priest who would influence all things spiritual and secular. Natives were encouraged to concentrate in compact settlements and construct a church that would serve as the center of community life. For missionaries along the upper reaches of the Rio Grande and among the Hopis and the Zunis, this proved to be an easy task as their potential converts already lived in compact towns. The nomadic Apaches and Seris posed more of a problem because the new system required a major restructuring of their traditional lifestyle. The Navajos, the Upper and Lower Pimas, the Yaquis, and the Opatas, whose settlement patterns varied but were rarely compact, also challenged the Spanish mission system. Missionaries hoped to introduce Spanish culture into these communities by converting natives into Christian farmers and tradesmen. They taught them to breed and manage domesticated animals, raise European crops, and use European tools. Some natives learned blacksmithing, weaving, carpentry, and masonry—all necessary skills for a self-sufficient community based on a European model.

In addition to the construction of a suitable community, the establishment of Catholicism within the mission served as the paramount task of the missionary. Friars quickly baptized and instructed native children in Christian doctrines. Priests railed against polygamy, fornication, and drunkenness and tried to institute the practice of confession among the adult population. Unlike the Jesuit missionaries in Sonora, Franciscan friars in the northern reaches of New Spain's frontier generally did not tolerate native customs—particularly religious ceremonial practices. They frequently used force or liberally administered corporal punishment on those who continued to follow traditions the priests abhorred. Franciscan missionaries banned ceremonial dances and kachinas, destroyed masks, and arrested native spiritual leaders.

The repressive policies of the Franciscan friars that sought to eradicate Pueblo religious icons and ceremonies led to the 1680 Pueblo Revolt, one of the most effective native revolts in American history. Popé, a spiritual leader from San Juan Pueblo, unified the majority of the Rio Grande Pueblos in a coordinated revolt against the Spanish in early August 1680. His 8,000 followers killed over 400 Spanish colonists and 21 of the 33 Franciscan friars in New Mexico. Even the Hopis, on the far western fringes of the province, drove out the Franciscans from their mesas. Those Spaniards who were not killed or wounded in the Pueblo Revolt fled back to Mexico, and the victors destroyed the vestiges of Spanish culture, including objects associated with Christianity.

The volatility of Spanish-native relations spread beyond New Mexico. In 1695, a revolt by Upper Pimas in northern Sonora

Contemporary illustration of a Spanish mission settlement in Texas during the 1700s. (North Wind Picture Archives)

(Pimería Alta) led to the destruction of Jesuit missions in Tubutama, Caborca, Imuris, and San Ignacio and the death of a young priest. Spanish reprisals were swift and deadly, but the revolt severely shook the missionary program established by Father Eusebio Francisco Kino in Pimería Alta. Revitalization of the Jesuit missions began in 1732. By 1750, nine missionaries worked among the Upper Pimas. A second Pima revolt in 1751 led to a widespread but short-lived uprising that weakened, once again, the Jesuit presence in northern Sonora. Following the Spanish expulsion of the Jesuits from all their territories in 1767, Franciscans attempted to carry on the missionary work among the Upper Pimas, but with little success.

Growing French and Native American encroachments along the eastern frontier in Texas led Spanish officials to send Father Damián Massanet in 1690 to "Tejas" in hopes of establishing missions among the Caddoes. Troubles with the native population, inadequate supplies, crop failures, and floods forced the abandonment of the two missions three years later. In 1716, 12 Franciscan missionaries returned to east Texas along with military support and colonists under the command of Captain Domingo Ramón and established four churches and a presidio in Caddo country. Ramón further extended Spanish settlement when he erected two more missions just west of the French trading post at Natchitoches. Exaggerated fears of a French invasion in 1719, however, persuaded the colony to withdraw to San Antonio.

Two years later, Spain recovered its possessions in East Texas and built two more presidios, but the effectiveness of the mission system seemed to be dwindling. Franciscans unsuccessfully recruited nomadic plains natives who rejected the limitations of

mission life and easily obtained European goods from French traders via horseback. During the colonial period, missionaries in Texas achieved their only success—albeit limited—along the San Antonio River where five missions served approximately 1,000 natives who sought refuge among the Spanish.

By the beginning of the 18th century, the Spanish mission system along the northern frontier of New Spain came increasingly under criticism. Disenchanted Spaniards became unhappy when mission natives were not allowed to fully integrate into Spanish economic life. Natives were not wage laborers or taxpayers. Native land proved to be the most fruitful for farming and ranching, but it remained unavailable for Spanish settlement. Missionaries attempted to cling to their bastions of authority, unwilling to surrender native souls and loyalty (as well as their own influence) to politicians and bureaucrats. The Spanish mission system in New Mexico, Sonora, and Texas almost disintegrated toward the end of the colonial period as Spain grew more concerned about foreign encroachments along the northern and eastern fringes of its provinces than the conversion of American Indians to Catholicism.

In Alta California, however, the mission system remained a viable avenue for the conversion of native peoples as well as an effective means for projecting Spanish influence on the frontier throughout the late 18th and early 19th centuries. In 1768, Russian settlements on the California coast prompted Spain to send Franciscans under Father Junípero Serra, along with a military escort, to establish a permanent Spanish presence in the northwestern reaches of New Spain. The following year, Serra founded a mission in San Diego, the first of 21 missions constructed in Alta California, between 1769 and 1823. The success of the mission system in

748 Spotswood, Alexander

California came at a heavy cost, however. Disease and strenuous labor requirements reduced the native population by 50 percent before the end of the Spanish colonial period.

Spotswood, Alexander

Born: 1676

Died: June 7, 1740

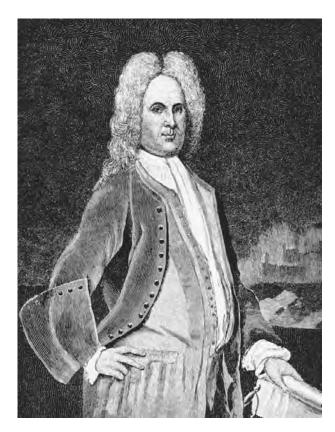

British colonial official and lieutenant governor of Virginia (1710–1722). Alexander Spotswood was born in Tangier, Morocco, in 1676. In 1693, the young ensign joined the Earl of Bath's Regiment. During the War of the Spanish Succession (1702–1713) he rose to the rank of lieutenant colonel in forces under the Duke of Marlborough and there impressed Lord George Hamilton, Earl of Orkney and titular governor of Virginia. In 1710, Orkney named Spotswood his lieutenant governor, a post he held for 12 years. In Orkney's absence, Spotswood bolstered Virginia's defenses, lobbied for western expansion, and subdued marauding pirates.

In September 1711, when Tuscarora warriors ambushed North Carolina settlements, Spotswood promised British-allied natives both trade and bounties for enemy prisoners. Although Virginia's House of Burgesses favored military action, Spotswood's diplomacy culminated in a treaty with eight Tuscarora towns on December 11, 1711, and procured the release of captives.

Eager to create a defensive buffer along the frontier, Spotswood chartered the Virginia Indian Company and confined all trade south of the James River to Fort Christanna. In return the company defended the frontier, protected tributary natives, and educated native children until the measure was repealed in 1718.

Spotswood also subdued marauding pirates. After learning that Edward Teach (Blackbeard) had been pardoned by North Carolina's governor, Spotswood dispatched Lieutenant Robert Maynard and others to arrest him. During the subsequent battle at Ocracoke Inlet on November 22, 1718, Blackbeard was killed.

The governor hoped to thwart French designs on the trans-Appalachian West by organizing an expedition across the Blue Ridge Mountains. On September 5, 1716, the "Knights of

Alexander Spotswood, British colonial official and lieutenant governor of Virginia. (North Wind Picture Archives)

the Golden Horseshoe" reached the Shenandoah Valley. Following this expedition, Spotswood lobbied British leaders to build a road from the Blue Ridge to the Great Lakes before France claimed the region.

Spotswood's tenure as lieutenant governor ended in 1722, while he was negotiating a treaty with the Iroquois Confederacy in Albany, New York. Only after his return to Williamsburg in October did Spotswood learn that he had been replaced by Hugh Drysdale. By now a man of great wealth, Spotswood turned to overseeing his 80,000 acres of land, two iron foundries, and four plantations.

When the Anglo-Spanish War (1739–1744) erupted in 1739, Spotswood raised a company of volunteers. He died of a fever at Annapolis, Maryland, on June 7, 1740, while preparing to join a British expeditionary force bound for Cartegena, Colombia, to seize that valuable Spanish port.

Springfield, Burning of Event Date: October 5, 1675

Attack on Springfield, Massachusetts, by Agawam and allied Nipmuck warriors on October 5, 1675, during King Philip's War (1675–1676). Springfield was the preeminent English settlement along the Connecticut River.

In the summer and fall of 1675, King Philip's War had spread from a localized conflict between Metacom's (King Philip) Wampanoags and Plymouth Colony to include other New England colonies and American Indian peoples. In the Connecticut River Valley, local natives had already attacked Squakeag, Deerfield, and nearby Brookfield. The Springfield area had suffered some minor raids, but townspeople continued to believe that the neighboring Agawams were still loyal to the English, or at least neutral.

In late September and early October, the commissioners of the United Colonies of New England ordered the gathering of troops at the town of Hadley, Massachusetts. There they readied themselves for an expedition against enemy Native Americans north of Springfield. In response, Springfield community leader and military commander Major John Pynchon marched most of that town's troops north. With the town virtually undefended, a messenger arrived on October 4 with intelligence that Springfield's Agawam neighbors were plotting with Metacom to attack the town.

The next morning, October 5, Lieutenant Thomas Cooper and Constable Thomas Miller rode out of Springfield intending to talk with the local natives and dispel rumors of attack. Warriors ambushed the two men. Miller fell dead, whereas the mortally wounded Cooper managed to ride back to town and warn the inhabitants. Springfield's residents were thus able to withdraw safely to fortified garrison houses. They could do nothing, however, to prevent warriors from burning the settlement's undefended houses, barns, and outbuildings.

On learning of the native attack, two English forces under Pynchon and Major Robert Treat immediately marched south to relieve Springfield. Treat arrived first and attempted to cross the Connecticut River to assist the town, but his forces were driven back. The attacking natives, who had been reinforced by Nipmuck warriors, then withdrew with the midafternoon arrival of Pynchon's forces from Hadley.

The English suffered only minor casualties in the attack, with three dead and three or four wounded. Nevertheless, the town was virtually destroyed. More than 30 houses, countless outbuildings, corn and hay stores, and indispensable mills all burned to the ground. Nearly a third of the town's families were left homeless and destitute. Despite the tremendous destruction, English settlers and soldiers remained in Springfield, thus maintaining an English pres-

ence in the upper Connecticut Valley. Not surprisingly, the "treachery" of supposedly friendly natives led to greater suspicion of all neutral or English-allied natives. This resulted in the internment of Massachusetts' "Christian" natives on Deer Island in Boston Harbor. Furthermore, the English defeat at Springfield reignited the debate over colonial military policy. Clearly, the concentration of troops for offensive actions against hostile natives had left Springfield and other towns virtually undefended. As a result, the colonies began using a combination of garrison forces to protect exposed settlements and raiding forces to combat native enemies on their own ground.

Squanto

Born: Unknown Died: 1622

Patuxet native (New England) perhaps best known for his services as an interpreter for the Pilgrims. Squanto also showed the Pilgrims how to survive in New England. No information is known about Squanto's birth or early years. In 1614, Thomas Hunter seized a number of native captives, including Squanto, who was then taken to Spain to be sold as a slave.

Little is known about Squanto's time in Spain. However, by 1617, he was living in the London home of the Newfoundland Company's treasurer, John Slany. Hoping to use Squanto as an interpreter and intermediary, the English took him to Newfoundland in 1618. Squanto returned to his native Patuxets while serving as a guide for Thomas Dermer's 1619 expeditions to Cape Cod and Martha's Vineyard. On his return to Patuxet, he discovered that the village had been wiped out by smallpox.

The Wampanoags subsequently took Squanto captive and he remained with them until March 1621. Working with an Abenaki named Samoset, Squanto helped the Wampanoags establish relations with the new English settlement at Plymouth. Squanto soon began spending more time with the English, serving as an interpreter between the Plymouth leadership and Wampanoag sachem Massasoit.

The Wampanoags then permitted Squanto to live with the English. There he acted as an interpreter and mediator for the English. He also obtained a quantity of maize and trained the English set-

Contemporary illustration of Squanto, a Patuxet Native American who served as an emissary to and interpreter for the Pilgrims. (Hulton Archive/Getty Images)

tlers in the planting and harvesting of the crop. His instruction in the cultivation of corn may indeed have helped the Pilgrims survive the first few harsh winters of New England.

Squanto also attempted to rebuild the Patuxets, scouring the region for survivors of the smallpox epidemic. This angered the Pokanokets, who saw this as a challenge. Thus, Plymouth Colony vowed to protect Squanto. Despite his difficulties with the Pokanokets, Squanto did exercise a degree of influence among native peoples. Toward the end of his life, which was spent among the Pilgrims, he lost some of that prestige when he was accused of playing the Wampanoags and Pilgrims against the other. Squanto died sometime in 1622, in the vicinity of the Plymouth Colony.

Stamp Act

Event Date: March 22, 1765

Parliamentary decree passed in March 1765 that levied a tax on virtually all paper goods, legal documents, newspapers, and so on in British North America. The Stamp Act was the first and only statute passed by Parliament that directly taxed the legal, commercial, and cultural activities of North Americans. The decree was also the first action by the British government that prompted delegates from several North American colonies to meet, without the authorization of British authorities, in a congress to draft a common declaration of their rights, which they believed to be violated by the Stamp Act.

The Stamp Act was part of a broader economic plan of imperial taxation developed by Prime Minister George Grenville. His plan was in response to the increased national debt accrued because of the French and Indian War (1754–1763). Grenville hoped to have the North American colonists pay their fair share of imperial expenses.

The Stamp Act sailed through Parliament and received the assent of King George III on March 22, 1765.

The statute, designed to go into effect on November 1, 1765, required that specially stamped paper, or in some cases separately affixed stamps, be used for the preparation and sale of virtually all printed materials. These included newspapers, almanacs, pamphlets, broadsides, legal documents, insurance policies, licenses, and playing cards. Previous British taxes on the colonies had been levied on just a few imported goods, mostly molasses, refined sugar, and wine. Under the Stamp Act, all colonists who used or read a stamped document could readily see the impact of the tax. And rather than using salaried tax gatherers, as it did in collecting import duties, the British government designated an agent in each colony as the exclusive purveyors of the stamped paper or affixed stamps. This was supposed to create colonial trust and positive feelings. Finally, the Stamp Act declared that its purpose was to raise revenue to support British Army units and royal government in America.

The American response to the Stamp Act was immediately hostile nearly everywhere. In Boston, the reaction was explosive. That town saw two major riots in August that forced the resignation of the local stamp agent. Boston's action probably made it easier for radical leaders and aroused crowds in New York and Philadelphia to force the resignation of their agents without violence. But established political leaders in several colonies did not stop there. Nine colonies named delegates to meet in a congress in New York City in October 1765 to frame a common protest against the Stamp Act. On October 19, 1765, this congress asserted that the colonists held the same rights and liberties as British subjects living in the British Isles. The declaration further maintained that the colonists were

Important British Legislation Regarding the North American Colonies

Act	Date Passed	Function
Navigation Acts	1651-	Dictated types of goods and nationality of ships and crews involved in colonial trade
Molasses Act	1733	Imposed tax on non-British sugar, molasses, and rum imported by the colonies
Iron Act	1750	Reduced duty on colonial iron ore imported to England, restricted colonial trade in
Sugar (Revenue) Act	1764	iron goods Reduced duties on sugar, but provided for stricter enforcement
Currency Act	1764	Prohibited colonists from using paper money to pay off public or private debts
Stamp Act	1765	Required stamps or stamped paper for most printed materials (newspapers, licenses, etc.)
Quartering Act	1765	Required colonial authorities to provide supplies and bar- racks to British troops
Declaratory Act	1766	Stated that Parliament had the right to legislate for the colonies in all cases
Townshend Acts	1767	Imposed duties on glass, lead, paints, paper, paste- boards, china earthenware, silk, and tea

free from the legislated taxes of Parliament because they were not represented in that body, and that only their own elected assemblies could tax them.

Grenville fell from power in July 1765, and Lord Rockingham became head of the ministry. By the fall of 1765, the forced resignation of the stamp agents and the organization of non-importation boycotts forced both Parliament and the king to turn to a new policy. Prompted by committees of British merchants hurt by a colonial boycott of British goods, the Rockingham Whigs began preparing to repeal the Stamp Act and develop a more conciliatory approach toward the American colonies. In February 1766, the proposed repeal of the Stamp Act sharply divided Parliament.

By March, however, it was evident to the Rockingham Whigs that they could only secure repeal by agreeing to a simultaneous Declaratory Act that would affirm Parliament's right to legislate for America. On that basis, Parliament rescinded the Stamp Act and imposed the Declaratory Act on March 18, 1766. Americans in nearly every colony greeted the repeal with an outpouring of celebration, largely ignoring the ominous Declaratory Act. The first great crisis in British-American relations had passed. New parliamentary taxation the following year, however, would prove that deep problems in the imperial relationship remained unresolved.

Standish, Myles

Born: ca. 1584

Died: October 3, 1656

First military adviser and captain general of the Plymouth Colony. Later he served the colony in a number of capacities, including treasurer from 1644 to 1649. Myles Standish was born about 1584, most likely in Chorley, Lancashire, England, and was commissioned as a lieutenant in the army in 1602. Standish eventually caught the attention of Rev. John Robinson, the spiritual leader of the refugee Pilgrims in Leiden, Holland, where Standish was serving during the Twelve Years' Truce in the Dutch revolt against Spain.

Opting to leave the Netherlands and emigrate to the New World, the Pilgrims recruited Standish to manage the defense of the colony. Outfitted with his armor, helmet, rapier, dagger, and a musket, Standish—now a captain—was militarily the most well equipped of all the colonists when they set sail in August 1620. The diminutive Standish, with his deep red hair and prickly temperament, proved a formidable adversary to the New World natives, whom he regarded with much distrust.

On November 11, 1620, Standish and 40 other male passengers onboard the *Mayflower* anchored off present-day Provincetown, Massachusetts, and signed the Mayflower Compact, creating a civil government for Plymouth Colony. Standish immediately oversaw a reconnaissance of Cape Cod and ultimately approved of the site selected for settlement. During the first difficult winter in Plymouth, Standish was one of only 7 colonists untouched by ill health. Among the stricken was his first wife, Rose, who died in January 1621.

With growing anxiety over the ever-diminishing number of colonists and anticipating trouble from the natives from whom the colonists had previously commandeered corn, in February 1621 Standish removed four cannon from the *Mayflower* and positioned them on high ground near the settlement. Tensions subsided the following month, however, when Ousa Mequin (Massasoit), the grand sachem of the nearby Wampanoag Confederacy, forged an alliance with the colonists.

Meanwhile, Standish was elected "captain general" of the settlement. The alliance was mutually beneficial. It provided security for Plymouth and military aid for the Wampanoags in case of hostilities with their traditional adversaries, the Narragansetts.

Illustration depicting the landing at Plymouth in 1620 of Captain Myles Standish and other Pilgrims. Standish was subsequently elected captain general of the Plymouth settlement. (Library of Congress)

Standish did not hesitate to use aggression when faced with a perceived native threat. In 1623, he led a band of eight Plymouth men on a raid against the Massachusetts tribe after rumors surfaced of an imminent attack against Wessagusset, a small rival English fur-trading colony to the north (present-day Weymouth, Massachusetts). Standish saw the reportedly hostile natives as a threat to all colonists. Pretending to have come for the purpose of trade, Standish drew the suspected natives close to his party and then killed eight, including the sachem Wituwamet, whose head was later placed on display in Plymouth. In retaliation, Massachusetts warriors killed three Englishmen from Wessagusset. Fearing further reprisals, the remainder of the Wessagusset colonists abandoned their outpost and sailed back to England, leaving Plymouth, for the time being, with a monopoly on the fur trade.

Standish's heavy-handed preemptive strike did little for Englishnative relations and did not escape criticism. On learning of the incident, Reverend Robinson wrote Plymouth governor William Bradford from Holland about his concern that Standish had become "a terrour to poor barbarous people." Thomas Morton, a non-Pilgrim fur trader who was later arrested by Standish for "interracial cavorting" with the natives (and who referred to his jailor as "Captain Shrimp"), reported that Standish's ruthlessness led natives to regard all the English as "Wotowequenage" or "Cutthroats." Standish held a number of military and civil positions while at Plymouth. In 1635, the captain participated in an abortive attempt to reclaim a Plymouth trading post in Maine recently seized by the French. As a colonial agent and representative, Standish made several trips back to England to secure trade goods and negotiate debt repayments with the colony's merchant sponsors. From 1644 to 1649, he served as the treasurer of the colony. Standish died on October 3, 1656, in nearby Duxbury, a town he helped establish in the 1630s.

St. Augustine (Florida)

Spanish settlement founded in 1565 on the northeastern coast of Florida. The Spaniards established St. Augustine as a base from which they could defend their colonial interests in North America and especially the trade route for the treasure ships returning to Spain. Spain first claimed Florida as part of its empire when Juan Ponce de León explored the region in 1513.

Initial Spanish attempts at exploration and settlement there ended in disaster, however. The humid climate, frequent hurricanes, and hostile relations with the local Native Americans all but ruled out large settlements. Spain was thus content to leave Florida undeveloped.

The Spanish attitude changed in 1564, when French Huguenots established Fort Caroline near the mouth of the St. Johns River. This French outpost represented a direct threat to Spanish shipping interests, and in 1565 King Philip II dispatched Pedro Menéndez de Avilés to Florida with orders to destroy the fledgling French settlement.

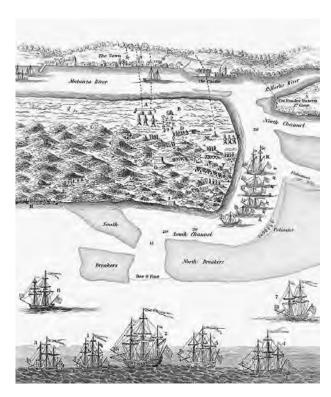

Accomplishing his mission, Menéndez established St. Augustine that same year to help secure Spanish sovereignty over Florida.

St. Augustine was not well defended or supplied during its early history. The Spaniards constructed a small wooden fort, but the inhabitants chiefly relied on a system of loosely organized Spanish missions and ties with the local natives to put their imprint on Florida. Heat, humidity, termites, and pounding storms all took a toll on the fort. Ultimately torn down, the fort was then rebuilt a total of nine times during the first 100 years of settlement.

Halfhearted Spanish attempts at ranching and agriculture came to little, and the struggling town was dependent on sporadic delivery of supplies from Cuba. Pirates sacked St. Augustine in 1668, exposing the glaring inadequacies of its defenses. With expanding English colonies and the establishment of Charles Town (present-day Charleston) in English Carolina in 1670, it became imperative that the Spaniards shore up the town's defenses. Construction of a stone fort, the massive Castillo de San Marcos, began in 1672 and was completed by 1695.

The fort successfully weathered two major invasions by the English in 1702 and 1740. It was protected by a series of barrier islands and a shallow harbor that prevented large ships from approaching too closely. Perhaps the most unusual feature of the fort was the unexpected benefit conferred by its construction material, coquina, a soft limestone made of sea shell fragments. Rather than breaking on impact of a cannon ball, coquina absorbs the blast, leaving a soft round dent in the wall, but holding firm. The Castillo de San Marcos was never taken by force, and no other serious attempts were made to capture it.

St. Augustine became a political pawn during the French and Indian War (1754–1763). In a major blow to Spanish pride, England captured Havana, Cuba, in 1762. As part of the peace treaty ending the war, England returned Havana to Spain in exchange for

Contemporary engraving by Thomas Silver depicting the British assault on Spanish St. Augustine, Florida, in June 1740. (Author's Collection)

Florida. When England took control of St. Augustine in 1763, all 3,000 inhabitants, mostly Spaniards, evacuated the town for Cuba.

St. Augustine, Battle of

Start Date: June 13, 1740 End Date: July 20, 1740

Unsuccessful British siege of Spanish-controlled St. Augustine, Florida, that took place during June–July 1740 and the Anglo-Spanish War (1739–1744). In 1733, James Oglethorpe founded the

colony of Georgia at Savannah, near the mouth of the Savannah River. He established Georgia on land already claimed by Spain.

From the start, Oglethorpe made preparations for an eventual confrontation with Spain, biding his time until he could muster sufficient strength to attack St. Augustine, then Spain's most valuable stronghold in Florida. Meanwhile, London, wary of starting a war with Spain in the New World, restrained Oglethorpe from any effort to realize his military ambitions.

Assaulting St. Augustine would not be easy. Barrier islands protected the Spanish post, and the harbor was too shallow for large warships to approach. Occasional breaks between the islands did provide inlets through which smaller ships could approach St. Augustine and its principal defensive bastion, the Castillo de San Marcos.

The beginning of the Anglo-Spanish War in 1739 (the War of Jenkins' Ear) led London to encourage Oglethorpe to launch raids against the Spanish to his south, and in late winter 1739, Oglethorpe began making preparations for an attack on St. Augustine by both land and sea. Oglethorpe's land force of some 180 colonists and Native Americans easily took the small satellite forts to the north and west of St. Augustine: Mosé, Picolata, and Pupo. His primary forces arrived by sea off St. Augustine in eight ships on June 13, 1740, providing Oglethorpe with an additional 1,000 colonial troops and 200 Native American warriors, most of the latter being Cherokees.

Almost immediately the English secured control of Anastasia, the barrier island directly across from the Castillo. Seven hundred fifty Spanish troops defending the fort now faced Oglethorpe's 1,400 men.

The Spanish governor of St. Augustine, Manuel de Montiano, dispatched an immediate appeal to Cuba for reinforcements and supplies. As with their assault on St. Augustine in 1702, it soon became apparent to the English that their only hope of victory was to starve out the fort's defenders. Montiano estimated that he had rations for less than a month. Unlike Gov. Joseph de Zúñiga y Cerda, who had defended the fortress in 1702, Montiano was unwilling to wage a purely defensive battle.

Taking advantage of the fact that English land and naval forces were scattered because of the geography of the harbor and could thus not effectively coordinate defensive measures, Montiano mounted a sortie that reclaimed Fort Mosé on June 26.

Oglethorpe then initiated a bombardment of the Castillo de San Marcos that lasted 27 days. The fort was spared the full impact of the cannon fire, however, because of the shallow water and the resultant distance of Oglethorpe's ships from the stronghold. Further adding to Oglethorpe's troubles was the unique character of the fort's walls. It was constructed of coquina, a soft lime-stone formed by compressed shell fragments. Rather than shatter on impact, the walls absorbed the shock of cannon balls with surprising ease.

The greatest danger to the defenders was starvation, and in early July, Montiano ordered half rations. At the same time he received the welcome news that Spanish relief ships had been spotted off the coast approximately 70 miles to the south. Unfortunately for Mon-

tiano, these ships were unable to gain the harbor because Oglethorpe's ships were guarding most of the navigable inlets that allowed access past the barrier islands to the inland passage.

Montiano then dispatched five shallow-draft boats to retrieve the supplies. Waiting until an English warship was out of sight of the Matanzas Inlet, these boats were able to slip into the inland passage and reach the fort on July 3.

By mid-July, Oglethorpe's men were badly demoralized. Suffering from the heat and mosquitoes, they were close to mutiny. With hope of a quick victory evaporating and with hurricane season about to begin, on July 20 Oglethorpe lifted the siege and sailed for Savannah.

St. Augustine, Siege of

Start Date: November 10, 1702 End Date: December 29, 1702

Abortive English siege of Spanish-held St. Augustine (Florida) at the beginning of Queen Anne's War (or War of the Spanish Succession, 1702–1713), from November 10 to December 29, 1702. The conflict was sparked by the death without heirs of Spanish king Charles II in 1700. The Spanish throne then passed to the grandson of King Louis XIV of France, who became king as Philip V and began the Bourbon dynasty in Spain. This Spanish-French alliance left Britain dangerously isolated. The English feared encirclement of their North American colonies by the Spanish to the south and French to the north and west and were therefore determined to destroy St. Augustine, the only substantial Spanish military base in North America.

In September 1702, Gov. James Moore of Carolina launched an expedition made up of between 800 and 1,200 (sources disagree) colonists and Native Americans to take St. Augustine. Most of the men traveled by sea in 14 vessels, but a small contingent led by Colonel Robert Daniel marched overland to attack St. Augustine from the west.

St. Augustine proved a challenging objective, as its strategically placed, well designed, and strongly built fort, the Castillo de San Marcos, provided an effective defense for the city. Spanish gover-

nor Joseph de Zúñiga y Cerda commanded the defenders. His strong leadership proved a major factor in enabling the defenders to endure a prolonged siege.

Moore mistakenly launched an unnecessary attack against a Spanish position on Amelia Island during the voyage to St. Augustine. This action deprived the English of the element of surprise. When their vessels arrived in St. Augustine a week later, Zúñiga was well aware of English intentions. He had also been able to dispatch by ship a plea to Spanish authorities in Cuba for reinforcements.

Zúñiga did what he could to prepare for the expected arrival of the English forces. He ordered his soldiers to round up cattle, and he opened the fort to the 1,500 inhabitants of St. Augustine. There they joined 323 soldiers. Zúñiga also ordered all structures within musket range of the Castillo to be razed in order to deprive the English of cover and allow the defenders clear fields of fire. On November 10, Colonel Daniel arrived from the west at the same time the Spanish soldiers were returning with a herd of 163 cattle. The Spanish were able to move the herd into the moat of the fort before the English could stop them.

When Moore's fleet arrived on November 10, the sand bar that lay at the entrance of the harbor prevented his larger vessels from approaching the Castillo. The cannon on them could thus not be fired against the fortress. Moore then dispatched an appeal to English authorities in Jamaica for additional troops and sea mortars, which could lob shells (known as bombs) over the fort's walls.

Knowing he was badly outnumbered, Zúñiga never attempted to engage the English in open battle. He was determined to endure the siege until reinforcements arrived. Although the Castillo de San Marcos was badly overcrowded, Zúñiga's firm discipline and his rationing of provisions would allow the defenders to resist for some time. If Moore could not starve the Spaniards out in the short term, his only hope of victory was to receive reinforcements himself before the Spanish also might reinforce.

On December 26, 1702, lookouts at the fort spotted ships' masts on the horizon. This sighting turned out to be four Spanish warships bearing supplies and reinforcements, enabling the Spanish to end the 50-day siege.

Faced with superior forces, Moore ordered the town of St. Augustine burned and his ships also destroyed. His forces then withdrew overland.

Both Moore and Zúñiga endured censure from their own governments. Moore had lost the element of surprise and, without effective artillery, his vastly superior manpower counted for little. Rather unfairly, Zúñiga came under criticism for failing to mount anything more than a defensive action to the English assault and allowing them to raze the settlement. An official Spanish inquiry, however, cleared Zúñiga of any wrongdoing and indeed praised him for his leadership during the siege.

Stevens, Phineas

Born: February 20, 1706 Died: April 6, 1756

Commander of the Fort at Number Four (New Hampshire), captain in the colonial militia, and intermediary between the English and Native Americans. Born on February 20, 1706, in Sudbury, Massachusetts, Phineas Stevens grew up in a prosperous colonial household. In 1723, his life assumed a dangerous turn. On August 14, 1723, a band of native warriors came on him and his three brothers walking. The warriors killed two of his brothers and took Phineas and his four-year-old brother captive. Taken to Canada, he was ransomed in 1724 and returned to his home.

In 1734, Stevens moved to a settlement named Number Four (later Charlestown) along the Connecticut River in New Hampshire, where he was one of the first inhabitants. In 1743, he was commissioned a lieutenant in the militia and charged with the defense of the frontier. He also commanded the Fort at Number Four. Thanks to his military abilities, some of which he learned while in captivity with the natives, Stevens became a militia captain. Over the next few years, he was charged with negotiating numerous treaties with frontier Native Americans. On frequent occasions, he concluded viable agreements. Colonial officials also charged him with negotiating with Native Americans who had kidnapped English settlers. For example, in 1752, he successfully negotiated for the release of kidnapped Englishman John Stark, who garnered fame during the American Revolutionary War. Stevens secured Stark's release in return for two ponies.

Recognized for his negotiating successes, Stevens once more assumed command of the Fort at Number Four, which served as a buffer fort for the defense of English settlements in western New Hampshire. Stevens's command of the post served as a vital part of frontier defense. Indeed, he successfully repelled a number of attacks during King George's War (1744–1748). Moreover, his policies toward Native Americans served as a model for negotiating and compromising, which would well serve the English in the French and Indian War (1754–1763). He took command of the fort again at the start of that war, although he moved his family to safety at Deerfield, Massachusetts. In 1755, Stevens participated in the expedition against the French in Nova Scotia, taking part in operations that led to the surrender of Fort Beauséjour in June. Stevens died at Chignecto on April 6, 1756, following a brief illness.

St. Lawrence River

The St. Lawrence River begins at the foot of Lake Ontario and flows eastward to the Gulf of St. Lawrence, covering a distance of about 750 miles. It drains a 1,900-mile-long watershed that originates with the North River and the St. Louis River in Minnesota, includes the Great Lakes, and connects these bodies to the Atlantic Ocean.

Without the St. Lawrence, the history of North America would have been completely different. The early French presence deep in the continental interior was only possible because of the river. Indeed, France's first ally among the Native American nations, the Hurons, and its first enemy, the Iroquois, would likely not have been encountered until many years later had it not been for the river access.

Quebec, the first major settlement on the St. Lawrence and eventual capital of New France, was tied directly to the river's geography. Samuel de Champlain founded Quebec in 1608 on the north shore of the waterway near the confluence of the St. Charles River. The heights there commanded the narrowing river passage. Similarly, the rapid growth of Montreal, situated some 170 miles upstream from Quebec, was also predicated on the utility of the St. Lawrence. Merchants at Montreal collected furs from the western hinterlands for shipment to Europe. Meanwhile, incoming soldiers,

colonists, military supplies, and trade goods could be disembarked there directly from French ports.

Even the earliest confrontations between Britain and France in North America were conditioned by the St. Lawrence. The capture of Quebec in 1629 by the English, for example, was made possible by a blockade of the river mouth, cutting off New France from resupply. Although Quebec was returned following subsequent peace negotiations, the English success exposed the main strategic weakness of New France's locale, namely, its almost complete dependence on the St. Lawrence for reinforcement and resupply.

The river complicated not just defensive strategies, but offensive plans as well. A bombardment from the heights of Quebec could be decisive when directed against enemy ships in the St. Lawrence. This was the case, for instance, during the attack on Canada by New England forces in 1690. The river's tidal fluctuations affected both the times and places that an amphibious landing at Quebec could be undertaken, and without knowledge of these, an attacker's plans could go awry, as occurred in 1690.

An approach by land to the St. Lawrence and New France from the British colonies to the south entailed traveling through dense wilderness, whereas the French had fortified and garrisoned the easier route from Lake Champlain to the Richelieu River. To the west, the stretch of the river from Lake Ontario to Montreal was interspersed with treacherous rapids that could be fatal to a careless invasion force, such as the one led by the British Army's Major General Jeffery Amherst in 1760.

In the end, however, the river that gave life to New France also conspired to extinguish it. British naval supremacy in 1759 and 1760 and the attendant control of the St. Lawrence that this produced led directly to the capture of both Quebec and Montreal and put a permanent end to France's colonial presence in North America.

St. Mary's Fort (Maryland)

Defensive outpost built by the English in 1634 along the St. Mary River in eastern Maryland. St. Mary's Fort guarded the access to St. Mary's City, Maryland's first settlement and for 60 years its colonial capital. Like most in its day, the redoubt was a center of both trade with, and defense against, Native Americans in the area. It also provided protection against raids by rival Virginia colonists, pirates, and assorted marauders who threatened the exposed Chesapeake frontier. The fortification—a 120-foot square palisaded log garrison well mounted with ordnance—was built on land purchased from the Piscataways by Leonard Calvert, Maryland's first governor. St. Mary's Fort, a square-shaped structure, more than likely resembled the palisaded Native American settlements in the area.

In June 1634, Calvert had landed with 140 settlers on St. Clements Island at the mouth of the Potomac River. The land was located along a river he named St. Mary, where he founded a settlement of the same name. It was the fourth permanent English community in North America. Chartered in 1669, St. Mary's City became the colony's capital and remained so until 1694, when, following the Glorious Revolution, then-governor Francis Nicholson moved the seat of government to Protestant Annapolis.

During the English Civil War (1642–1649), Captain Richard Ingle and his men attacked and plundered St. Mary's City in 1645, hoping to claim the colony of Maryland for Parliament. Governor Calvert escaped, and controlling Maryland's militia from head-quarters in Virginia, he eventually restored proprietary control in 1647. Having by this time become neglected and fallen into disrepair, St. Mary's Fort played no role in these events. Its earlier functions were now fulfilled by Fort St. Inigoes, a replacement erected at Fort Point in 1644. St. Mary's Fort has now been restored and is part of a larger historical complex, including a reconstructed state house, a replica of original capitol buildings, and assorted archaeological exhibits.

Stono Rebellion

Start Date: September 9, 1739 End Date: September 1739

Slave revolt near Charles Town (present-day Charleston), South Carolina, that began on September 9, 1739. Beginning in the 1720s,

South Carolinians complained of encouragement by Spanish officials in Florida of slave runaways, Native American raids, and servile insurrections. In 1720, one slave rebellion was put down once the slaves' escape to Florida had been blocked. Rumors of uprisings persisted. By the late 1730s, most of the colony's slaves were African born, and a majority of them had been residents for less than a decade.

In 1738, tensions in the region mounted when Spain issued a royal proclamation conferring freedom to slaves who fled British colonies. The Spanish built a fortification for them, Fort Mosé, near St. Augustine, Florida. Adding to the growing frustrations in South Carolina was the considerable increase in numbers of slaves brought in to work the burgeoning rice plantations since the late 1720s.

In 1739, Lt. Gov. William Bull informed the South Carolina assembly that fugitive bondsmen had become the colony's principal problem. Concurring, the legislators created a committee to study steps that might be implemented in response to Spanish support of slave flight.

With spreading reports of servile unrest and with the successful escape of three bond servants to Florida, the South Carolina legislature approved three measures to check slave insurgence. These were a petition to the British Crown for aid, additional coastal patrol boats, and bounties for returning runaways from Georgia. As a deterrent, two apprehended fugitives were publicly punished. Bull lamented, "There was a growing awareness among whites that their Negroes which were their chief support may in little time become their Enemies, if not their Masters, and that this Government is unable to withstand or prevent it." Anxiety in South Carolina only intensified when Georgia jailed a Roman Catholic clergyman believed to be a Spanish agent inspiring slaves to rebel.

The Stono Rebellion coincided with a severe outbreak of yellow fever in Charles Town in 1739. A notice concerning a security act that commanded every white male to bear arms to Sunday worship by September 29 also affected the uprising's timing. The revolt began while many slave owners were at church and took place before the act's implementation. Finally, the start of the Anglo-Spanish War (1739–1744) helped trigger slave unrest and explains the rebels' trek toward St. Augustine.

On Sunday morning, September 9, 1739, some 20 slaves huddled near a tributary of the Stono River in St. Paul's Parish, 20 miles from Charles Town. Most were of Angolan descent. Their leader was a man named Jemmy. The slaves went to Stono Bridge and there stole weapons from Hutchenson's store. The slaves murdered the salesclerks and left their severed heads on the store's front stoop.

Once outfitted with firearms, the slaves looted and torched a nearby residence, slaying the proprietor and his children. The rebels then moved southward, tracing the principal roadway to Georgia and St. Augustine. The band reached Wallace's Tavern before daybreak. They did not harm the innkeeper, but the rebels did plunder a neighboring dwelling and killed the family there. They then went on along the Pon Pon Road, the main route to St. Augustine, destroying four more houses and butchering their white

occupants. The rebels pressured hesitant slaves to accompany them, but other slaves joined of their own will. The slaves continued to kill any whites they encountered.

By chance, Lieutenant Governor Bull and a small entourage were traveling northward on the same road taken by the rebels. Realizing the circumstances, Bull galloped off to arouse the countryside.

The rebels paused before sunset. Now more than 60 in number and having covered more than 10 miles since the start of the rebellion, they gathered in a clearing on the northern edge of the roadway, close to the site of the Jacksonborough Ferry. There they danced, sang, and beat drums, hoping to draw more recruits.

While the slaves celebrated their freedom, as many as 100 whites on horseback advanced on the field. Taken by surprise, the slaves hesitated, undecided whether to charge the planters or run away. Reportedly those with arms fired two volleys. As some reloaded and others fled, the colonists dismounted and discharged fire into the slaves' ranks, hitting 14. Survivors were captured, interrogated, and then executed. The white colonists then proceeded to behead the corpses and laid the heads out at each mile post along the road.

The following Saturday, six days after the outbreak of the uprising, South Carolina militiamen overtook the remaining rebels. Despite a lack of food, the slaves had covered 30 miles. A fierce engagement ensued, in which the rebels were taken.

The Stono Rebellion resulted in at least 20 deaths among the white settler population and at least 40 slaves dead. In general, South Carolina responded to the Stono uprising with surprising calm. Besides taking military action against Spanish Florida, the proximity of which was viewed as a continual provocation, the colony enacted two laws to prevent a reoccurrence. First, a high tax on slave imports was levied to drive down the number of foreignborn slaves. Second, a 1740 slave code further limited slaves' activities, prohibited them from learning to read and write, and forbade them from assembling in large groups. The slave code also penalized slave owners for the infliction of immoderate labor or cruel discipline that might stimulate slave discontent.

The Stono Rebellion demonstrated how political turmoil awakened slave turmoil, and it prompted planters to be more aware of servile unrest. Slave revolts and rumors of revolts typically paralleled political conflict and warfare. Rebellions or rumors of rebellions occurred in 1759, prior to the beginning of the Cherokee War (1759–1761), in 1766 during the Stamp Act controversy, and in 1775 at the outbreak of the American Revolutionary War.

Strategy in Colonial North America

Geopolitical strategies—which include military, political, and economic considerations—are complex issues in colonial North American history. The time span and geographic area to be examined are considerable. And the sheer numbers of actors, ranging from sovereign states to joint-stock companies to colonists to Native Americans complicate the issue all the more.

From 1500 to 1600, the Spanish were the principal Europeans active in North America. After the discovery of mineral wealth in Central and South America, the Spanish moved to exploit the silver and gold in the region. The Spanish Empire in America gradually expanded to the North, both as a means to secure the "heartland" and in a quest for more gold and silver deposits. Two strategic problems confronted the Spanish: securing the region and securing the shipping routes out of the region and back to Spain.

Securing the region involved establishing effective and localized colonial governments and garrisons throughout the Caribbean Basin and Central America. The intent was to control the native populations and prevent other European states from securing colonial bases to raid the treasure fleets returning to Spain. The Spanish relied on their navy to escort and protect the annual treasure fleets.

In the third quarter of the 16th century, other powers began to intrude on the Spanish monopoly in the Americas. The Dutch, as part of their rebellion against Spanish rule, began raiding Spanish shipping. The English also began quasi-legal raids both at sea and on Spanish ports in the region. And with French Protestants operating from La Rochelle, France also participated in raids on Spanish shipping.

These attacks, although small compared to the vast wealth flowing out of America through the Caribbean Basin, encouraged the Spanish to extend small garrisons farther north along the Florida coast, establishing brief footholds as far north as the coast of southern South Carolina. Permanent garrisons and missions were established as far north as St. Augustine, Florida. The English and the Dutch were beginning to attempt settlements closer to the region to support their raiding efforts, but these proved unsuccessful, at least until the 17th century.

In perhaps the first "strategic" move of the period, the Spanish attempted in the 1580s to cut off the English raiders by invading England and supplanting Protestant queen Elizabeth I with a more amenable—and Catholic—monarch. This resulted in the 1588 defeat of the Spanish Armada, and the beginning of England's ascendancy to naval dominance and empire. The failure of the Spanish Armada and the continuing resistance of the Dutch further exacerbated the Spanish financial situation.

By 1640, French, English, and Dutch settlements were slowly developing along the eastern seaboard of North America, from the

St. Lawrence River to Virginia, as well as within the Caribbean Basin. However, until the late 1600s, strategic interactions among these settlements were still limited. Initially, most of them were isolated from one another, struggling to survive, and more concerned with the possible threats from Native Americans than from each other.

The French settled in Canada, principally along the St. Lawrence River. Their considerable economic interest in the fur trade resulted in limited numbers of settlers, which would plague them when conflict with England erupted at the end of the 17th century. However, the experiences of French traders with the Native Americans were an advantage to the French, for they helped forge valuable economic and military alliances. The French also required less land than did the expansive English settlements. This too drew more native support to the less-intrusive French. Between 1680 and 1750, the French extended their posts south and west into the valleys of the Ohio River and the Mississippi River. Nevertheless, their numbers in these regions were scant.

The French had also established colonies in the Caribbean, on islands like Guadeloupe, Martinique, and Haiti. During the late 1600s and 1700s, these so-called sugar islands would become the principal arenas of European competition, with repeated conquest and reconquest as the tides of naval power in the region shifted.

The English had a more aggressive settlement policy in North America. Eventually, their settlements ranged from Maine to Georgia. The English settlements were more populous and self-supporting than those of either the French or the Spanish. This would be a great strategic advantage for the English. However, local home rule in the various colonies propagated a lack of central direction and control, which oftentimes impeded successful united action by the English and their colonists.

England also had colonies in the Caribbean, ranging from the Windward and Leeward Islands to the island of Jamaica. These outposts produced great wealth in the form of sugar and tobacco and were a primary concern of the British Crown. These colonies also relied almost exclusively on slave labor. The British Navy would have the task of defending the island colonies and maintaining the lines of communication and trade between them, North America, and England.

The Dutch also had several settlements on the continent until 1664, when New Amsterdam was ceded to England and renamed New York. Dutch colonies were concentrated in the New York, New Jersey, and Delaware areas. The Dutch established alliances with the Iroquois as a result of Huron alliances with the French. These alliances were transferred to the English after the 1660s. Dutch settlers integrated into the English system, especially after the Dutch and English became allies in 1689. The Dutch continued to maintain colonies in the Caribbean Basin and also devoted naval resources to the region.

Native Americans are often seen as passive targets of European encroachment, but this was far from the case in many instances. Rivalry between tribes often resulted in alliances between tribes and the Europeans. The Hurons, for example, established a trading

relationship with the French, which implied to the Hurons that the French were their allies. Indeed, in the early 17th century they induced the French to accompany them on a raiding party against the Iroquois. The resulting encounter placed the French and the Iroquois on opposing sides throughout most of the colonial period (1609–1763). On their part, the Iroquois sought aid from the Dutch and then the English.

In the South, along the ambiguous frontier separating English claims, Spanish Florida, and French Louisiana, tribal rivalries saw various Native American nations playing one side against the other in what would become a deadly dance. Unlike the rather simple confrontation in the North between the French and the Algonquin and the English and the Iroquois, in the South the strategic situation was complicated by the presence of the three European powers as well as several rival native nations, the Cherokees, the Creeks, the Chickasaws, the Choctaws, and others. The strategic goal of the natives was to preserve their independence, to strengthen their own hand against other tribes, and to slow the encroachment of the Europeans, especially the land-hungry English.

The national economic strategy of the three principal colonial states—England, France, and Spain—in North America was mercantilism. This economic system viewed wealth as a finite commodity. The idea was to obtain through colonial holdings all the necessary imports and to export surpluses to foreign nations. This brought an inflow of gold to the home government, increasing its wealth and its ability to wage war. All three, especially the Spanish with their dependence on specie from the New World, saw their colonies as important. But the critical theater would be Europe until the British undertook a different strategy in the French and Indian War between 1754 and 1763.

The strategic pattern of the series of four major wars, generally known as the Great War for Empire, between 1689 and 1763, had been established in the first conflict, King William's War (1689–1697). The French were significantly outnumbered in Canada by the English settlers in New England, and New York resorted to a raiding strategy. The French, using their Algonquin allies and their own woods-savvy militia with small numbers of French regulars, attacked frontier settlements to roll back the English frontier and to force the English to commit regular troops to defending their colonies. The French government saw the war in North America as a way to distract the English from more important theaters, particularly Europe.

The English settlers relied on local militias and recruited rangers to contain the French raiding strategy, and raised colonial forces to invade and conquer French territory. As the French expanded their grip on the Ohio Country, the Mississippi Valley, and the southeastern Gulf of Mexico region, the English felt increasingly surrounded by French power and deprived of the ability to expand farther westward. English colonists and the Iroquois saw French Canada as an ever-present threat, and hoped to eliminate it entirely. Therefore, they launched abortive invasions along the Lake Champlain Valley and toward Lake Ontario to infiltrate the heart of New France and

the fur-trading routes. They also undertook offensives into the St. Lawrence River Valley in order to reach Quebec.

The English government preferred to keep much of its manpower in Europe, seeing that as the critical theater. If they dispatched forces to the New World, it was mainly to the Caribbean. For the English Crown, the wars in North America were a distraction from more important conflicts and rivalries. North American colonies were seen as bargaining chips during peace negotiations to gain ground in more preferred areas. Not surprisingly, this outlook did not sit well among English colonists, whose livelihoods and lives were on the line. This sharp divergence in strategic aims between the colonies and the home government plagued the English until the rise of William Pitt the Elder in 1757.

When Pitt became the principal minister in 1757, during the French and Indian War (1754–1763), he changed the British approach significantly. Pitt saw the conflict as a global one, as more than just a conflict over the European balance of power. He viewed the British Empire as a unified whole and the sole source of British power; therefore, he aimed to protect it and to expand it. Indeed, he attempted to reduce the commitment of British forces in Germany by increasing subsidies to Prussia and by relying on mercenaries. Pitt then transferred men, material, and money to the colonial conflicts.

The British had begun to reinforce the colonials with regular forces as early as 1755; however, they attempted to force compliance with royal commands and exact monetary contributions from the colonial legislatures. The result was halfhearted efforts and abortive offensives led by British officers who had little patience with colonial forces and little understanding of the nature of colonial warfare. Pitt changed all that, treating the colonials much as he approached continental allies, with subsidies and incentives rather than threats.

In 1758, the British captured French-held Louisbourg in the Gulf of St. Lawrence for the second time, this time not as a bargaining chip for future negotiations but as the entry point to the St. Lawrence River and New France. In 1759, using predominantly regular forces, the British undertook four major offensives. The first three were along the long-established invasion routes, down the St. Lawrence River to Quebec, up the Champlain Valley toward Montreal, and westward along the Mohawk River to Lake Ontario. The fourth offensive headed west from Pennsylvania into the Ohio Country, with its objective to take the Forks of the Ohio and Fort Duquesne at present-day Pittsburgh. By 1760, all these offensives had succeeded, the French were essentially defeated, and New France had been absorbed. When the French and Indian War ended in 1763, the British had secured all of North America east of the Mississippi River to include Spanish Florida. They had also added additional island colonies in the Caribbean.

However, with all the new territory came new debt and new strategic considerations. British policy now became focused on cost reduction, and a significant portion of that cost reduction entailed attempting to limit conflicts between expanding American colonies and the Native Americans of the interior. Thus, the British govern-

ment promulgated the Proclamation of 1763 and attempted to restrict colonial expansion into the Ohio and Kentucky countries. This land had been long coveted by the colonists, who believed that they had earned their right to settle it. Additionally, colonial resentment over the apparent generosity of London's treatment of the Quebec province and the French settlers there was another bitter pill to swallow. The stage was now set for a new war in North America, one that would pit the English colonists against their own government.

Stuart, John

Born: September 25, 1718 Died: March 21, 1779

British merchant, frontier diplomat, and superintendent of Indian Affairs (1762–1779) in the southern colonies. Born in Inverness, Scotland, on September 25, 1718, John Stuart was educated in local schools and in London before traveling to Spain in 1736. There he worked as a clerk.

Returning to London, Stuart joined Commodore George Anson's 1740 expedition to the Pacific during the Anglo-Spanish War (1739–1744). Stuart's performance in this difficult operation earned him both high praise from Anson and substantial prize money. These funds enabled him to begin a career as a merchant.

Stuart lived in Portsmouth and London before migrating in 1748 to Charles Town (present-day Charleston), South Carolina, where he established himself in business. In 1749, Stuart traveled to England and married, and in 1751 he returned to South Carolina. He held various political offices there, including a seat in the provincial assembly. His business ventures failed, however, in 1752.

Shortly after the outbreak of the French and Indian War (1754–1763), Stuart secured a commission as a captain in the provincial militia and led his company to the frontier. His mission was to protect the pro-British Cherokees from Native Americans allied with the French. During his sojourn in the backcountry, he developed an admiration for the Cherokees and became close friends with one of their principal chiefs, Attakullakulla. Stuart was reassigned to oversee the construction of defenses at Port Royal (Beaufort) the following year. In 1759, he received orders to return to Fort Loudoun on the frontier, when hostilities began between the Cherokees and South Carolina. In August 1760, the Cherokees forced the surrender of Fort Loudoun following a five-month siege.

Although the garrison was permitted to march to another post with their arms, the Cherokees attacked the column on August 10, 1760. Stuart was among those captured in the ensuing battle, but Attakullakulla ransomed him shortly afterward. Attakullakulla then personally guaranteed his safe return to Charles Town. Stuart helped to negotiate the 1761 treaty ending the Cherokee War, and his intervention helped mitigate some of the colonists' harsher demands.

With the French and Indian War ending, the British government created two departments to manage native affairs. London named Edmond Atkin as superintendent of the Southern Department, which encompassed all natives living south of the Ohio River. On Atkin's death in 1761, Stuart became superintendent in early 1762.

Dedicating himself to the welfare of the American Indians, Stuart recognized that the colonists' unfair trading practices and land hunger were the chief sources of native-settler conflict. He therefore worked to regulate traders and vigorously opposed the efforts of southern governors and colonists to force the natives to cede land. These policies won Stuart the respect of the American Indians but made him extremely unpopular with the colonists.

When the American Revolutionary War erupted in 1775, Stuart worked to keep the southern natives neutral until the British government was capable of supporting them with regular troops. The Patriots, however, accused Stuart of planning to order the natives to attack the frontier. Mobs subsequently forced him to flee first from Charles Town and then from Savannah. He eventually established his headquarters at Pensacola, capital of the province of West Florida. Stuart indeed did not incite the 1776 Cherokee attacks on the southern frontier, but the colonists nonetheless held him responsible.

Stuart worked hard to keep the natives well disposed toward the British. With the defeat of the Cherokees in mind, he remained reluctant to encourage them to attack the colonists. This, along with the natives' own ambivalence, limited their contributions to the British. Stuart soon came under criticism from his superiors, who complained that the heavy expenses incurred to maintain native allegiance had yielded no substantial results. By 1778, illness had reduced Stuart's ability to perform his duties. He died at Pensacola on March 21, 1779.

Stuyvesant, Petrus

Born: ca. 1610 Died: February 1672

Dutch soldier and colonial official, the last director general of the Dutch colony of New Netherland (present-day New York). Petrus Stuyvesant was born in Scherpenzeel, near Wolvega, Netherlands, about 1610. His father was a pastor in the Dutch Reformed Church. Little is known about Petrus Stuyvesant's youth except that he entered military service at an early age and attended Franeker University during 1629–1630. By 1632, he was serving in the Dutch West India Company, which sent him to Brazil in 1635.

In 1643, Stuyvesant was appointed governor of Curaçao and other Dutch possessions in the West Indies. While participating in a campaign against the Portuguese in the West Indies in 1644, he was wounded in his right leg, which later was amputated and replaced by a silver-ornamented wooden one. This elaborately decorated leg became popularly known as his "silver leg." Soon after returning to Holland from Curaçao, Stuyvesant married Judith Bayard in the Walloon Church of Breda on August 13, 1645.

On July 28, 1646, the States General of the Netherlands commissioned Stuyvesant director general of New Netherland and other Dutch possessions in the New World. That same year, Stuyvesant sailed to Curaçao. He then went on to New Amsterdam (present-day New York City), landing there on May 11, 1647. Although he was an effective administrator who made determined efforts to provide New Netherland with an honest and efficient administration, Stuyvesant's religious intolerance and arbitrary methods made him an extremely unpopular governor.

Under Stuyvesant, a marked change in the appearance of New Amsterdam soon occurred as a result of numerous public works projects. Stuyvesant also made extensive changes in the city government. He created the Board of Nine Men to assist him in governing the settlement on September 25, 1647. Stuyvesant soon proved to be so autocratic, however, that the citizens of New Amsterdam, aided by directors of the West India Company, forced him to grant independent municipal control of the city on February 2, 1653.

Stuyvesant was also not very successful in settling a longstanding dispute between Connecticut and New Netherland. By

Petrus Stuyvesant, the last director general of the Dutch colony of New Netherland (present-day New York). (Library of Congress)

way of the humiliating Treaty of Hartford in 1650, Stuyvesant virtually relinquished Dutch control of the Connecticut River Valley. Pressures exerted by English colonists also resulted in Stuyvesant's granting to several Long Island towns the right to elect their own officials.

As a devout member of the Dutch Reformed Church, Stuyvesant was autocratic in his religious policies. He regarded all nonconformists as likely to foment rebellion and therefore dealt harshly with them, particularly Lutherans and Quakers.

With the West India Company on the verge of bankruptcy, Stuyvesant resorted to a policy of taxation to provide for badly needed improvements during his years as director general. Furthermore, he strove to eliminate smuggling to prevent loss of revenue. He also sought to improve relations with Native Americans by attempting to eliminate unscrupulous business practices long used by the merchants of New Amsterdam and Fort Orange (present-day Albany). Nonetheless, Stuyvesant was adamantly opposed to any governmental reforms that might lessen his own authority over New Netherland. Throughout his directorship, he rejected all demands for the creation of a popularly elected legislative assembly.

From 1653 to 1664, Stuyvesant's primary concern was to prevent the decline of Dutch influence on Long Island. Despite his arduous efforts, Stuyvesant's efforts met with only mixed success. His most notable achievement in this period occurred in 1655 and

involved a longstanding dispute over Swedish colonization of the Delaware Valley. To deal with this problem, he invaded New Sweden and forced its surrender. He was also able to keep the Native Americans restrained.

Despite his successes with the Swedes and the natives, Stuyvesant's dealings with aggressive colonists were far less successful. Increasing difficulties with the English over boundaries and trade eventually climaxed with the appearance of an English fleet in the harbor of New Amsterdam in 1664. Its commander, Colonel Richard Nicolls, demanded the city capitulate to the Duke of York, who laid claim to all the land between the Connecticut River and the Delaware Valley. Stuyvesant, whose plans for the defense of the city were opposed by the local burghers, was compelled to surrender New Netherland to the English without resistance on September 8, 1664.

In October 1665, Stuyvesant arrived in the Netherlands to defend himself against charges of misconduct. Returning to America, he retired to New York in 1667 and lived on his farm, or *bouwerij*, from which New York City's Bowery takes its name. He died in February 1672 and was buried beneath the chapel on his farm, which is now the site of St. Mark's Episcopal Church.

Sudbury Fight

Event Date: April 21, 1676

Native American attack on Sudbury, Massachusetts. By mid-April 1676, almost a year into King Philip's War (1675–1676), the Massachusetts Bay General Court decided it could not afford to abandon the western frontier in the face of Native American attacks. The colony's leader decided to make a stand at Sudbury, the westernmost town still boasting a civilian population and only 17 miles from Boston.

On the evening of April 20, 1676, between 500 and 1,000 Wampanoag, Nipmuck, and Narragansett warriors, possibly led by King Philip (Metacom) himself, invested Sudbury. The next morning they attacked. The inhabitants had taken safety in garrison houses and the natives, unable to penetrate these strong defenses, instead burned several uninhabited homes and barns. Soon, assis-

tance for the beleaguered settlers arrived from nearby Watertown. The men of the two towns were then able to drive the attackers back to the western side of the Sudbury River.

As that fighting took place, captains Samuel Wadsworth and Samuel Brocklebank arrived from Marlborough with their two companies of militia, some 50–60 men in all. Arriving at the outskirts of Sudbury, the relief force spotted a party of retreating natives and quickly pursued them. Suddenly, the militiamen found themselves confronting several hundred warriors. The militia had fallen into a trap. The men fought their way to nearby Green Hill, where they waged a pitched battle with the natives throughout the afternoon. Local militia forces from Sudbury tried but failed to break through to the two surrounded companies.

As the afternoon wore on, the natives set fire to the brush on the hillside, blinding and choking the colonial defenders. In a moment of panic, some of the militiamen bolted and ran down the hill in an effort to escape. This action caused others, who could barely see, to believe that a retreat was underway and they followed. As the colonial defenses splintered, the natives, sensing a rout, fell on the militiamen and hacked them to pieces. Wadsworth and Brocklebank were both killed, along with some 30–40 of their men.

Following this slaughter, the native force withdrew from the town. The next day, a force of men from Sudbury, accompanied by a contingent of Christian native allies, crossed the river to bury the dead. To their surprise, they discovered 13 militia survivors in a nearby mill.

Sudbury was a demoralizing defeat for the colonial forces. Yet the native alliance that had made possible the attack was starting to splinter, as Mary Rowlandson noted in her diary on the return of the native victors from Sudbury.

Sugar Act

Event Date: April 5, 1764

Legislation to increase tax revenues from the British American colonies in the period immediately following the British victory in the French and Indian War (1754–1763). The American Duties Act of 1764, usually referred to as the Sugar Act, was designed to improve tax enforcement as well as change the tax structure itself in the North American colonies.

The Sugar Act, carried through Parliament by the government of Prime Minister George Grenville, became law on April 5, 1764. It replaced the Molasses Act of 1733. That decree had taxed American colonial imports of sugar, molasses, and rum from outside the British Empire to protect British Caribbean sugar from competition with cheap French colonial sugar. The act had been easily circumvented, however. Indeed, smuggling activity had increased during the French and Indian War. Although the new act lowered the duty on foreign molasses, it imposed the duty on all sugar or molasses regardless of its source. It also placed heavy taxes on coffee, wine, and other luxury goods. The revenues would be devoted to supporting the British Army in America. The act also increased taxes on rum distilled in the French Caribbean.

The Sugar Act contained several measures to improve the integrity and efficiency of the customs service. Dishonest officers were subject to stiff fines. The act also established a new vice admiralty court with jurisdiction over customs cases in the British colonies, and placed it in the garrison town of Halifax, Nova Scotia. There the judges would be safe from mob intimidation. Crown prosecutors could now insist that customs cases be heard in this court rather than colonial common law courts, where jurors were often sympathetic to the alleged customs evaders.

The Sugar Act aroused great resentment among the colonists, particularly in Boston and New York. James Otis of Massachusetts denounced it in his pamphlet *The Rights of the British Colonies Asserted and Proved*, which enunciated the principle of no taxation without representation.

The New York Assembly also asserted that the colonies had the right to consent to their own taxation in its petition to Parliament against the act. Massachusetts, the only other colony to petition, was more moderate, complaining against its alleged bad effects on trade rather than its violation of colonial rights. Whatever the arguments against the act, the legislation undoubtedly stirred colonial anger. This ultimately would be manifest in increasingly rebellious colonial responses to additional British taxes and would lead inexorably to the American Revolutionary War.

Supplies

Provisioning an army during the colonial period was not unlike supplying a modern-day fighting force. Food, shelter, weapons, and fuel for horses in the form of forage were standard fare. Bread was the staple food item of an 18th-century army. Meat might accompany an army, but it was "on the hoof," that is, in the form of animals to be slaughtered as needed. In addition, civilian "sutlers" assigned to regiments would sell soldiers additional provisions, including rum and vegetables. Vegetables were helpful in preventing scurvy. When time and circumstance allowed, soldiers supplemented their diets by gardening, hunting, trapping, or fishing on their own or by buying—or stealing—directly from farmers.

An ideal regular weekly ration for a soldier in the British Army included seven pounds of beef or four of pork, fresh or salted; seven pounds of bread or sufficient flour to bake it; three pints of peas or beans; half a pound of rice; and a quarter-pound of butter. A subaltern was entitled to a double ration, a captain to a triple ration, and a colonel to six times the ration of an enlisted man. Officers could sell any extra back to the commissary at a fixed rate.

After 1756, provincial troops drew the same rations as British regulars. Provincials, however, were often found on fatigue details, such as road repair, which took them to isolated locations and often made supply difficult. Provincials considered their provisions to be a matter of contractual obligation. In fact, many, especially New Englanders, kept careful notes in their diaries of the quantity and quality of their food, rum, and other supplies. Failure to provide adequate supplies could bring desertions or mutiny.

Supplies other than food included blankets, tents, various tools, and ammunition (musket balls, powder). In colonial North America, adult males called into service were expected to furnish their own weapons. Forage might also be needed for horses.

The quantity of supplies carried by an army in the field depended on the extent of resources available in the region. In North America, that tended to be quite limited. Operations generally ceased during the winter, in part because of the difficulty of either finding or transporting supplies.

Access to supplies, of course, was vital to the outcome of a siege. British domination at sea in 1758 doomed Louisbourg by preventing its resupply. On the other hand, the British failure to stop ships from reaching St. Augustine in 1702 allowed the Spanish to hold out. Isolated frontier outposts, such as Fort Duquesne and Fort Oswego, were constantly at risk because of the precarious nature of their supply lines.

On at least one occasion, supplies were used for counterintelligence purposes. To deceive French agents about the true destination of a fleet bound for North America in 1711, the English provided it with only sufficient supplies for a trip to southern Europe. Unfortunately, when the fleet arrived in Boston, the city was already suffering a food shortage, and the addition of thousands of hungry men generated resentment among the local popu-

lation. Supplies could also be willfully withheld from troops, either as a punishment or as a result of corruption among officers.

During the French and Indian War (1754–1763), supplying soldiers in the field became more difficult—and more contentious—because of the sheer number of troops involved. Many colonial merchants made their fortunes selling their wares to the British and provincial units. However, the tight supply and large demand for goods often created shortages and led to inflated prices, which resulted in resentment and even hardship among the civilian populations.

Susquehannocks

Native American group concentrated in the Susquehanna River Valley. Among the most powerful tribes of the mid-Atlantic region at the time of the European arrival in North America, the Susquehannocks were exterminated in 1763. They spoke a dialect of the Iroquois language. The Susquehannocks lived in about two dozen fortified villages along the Susquehanna River and its tributaries in Maryland, central Pennsylvania, and southern New York. Their villages—the largest of which was located near present-day Lancaster, Pennsylvania-were vast stockades that surrounded longhouses. The longhouses were framed with logs and had a rectangular shape and vaulted roofs. They were 50 to 100 feet long and 18 to 25 feet wide, covered with bark, and had vent holes in the roof to allow smoke from fires to escape. Families slept together on raised platforms on either side of the structure and used animal furs for covers. Because the Susquehannocks were matrilineal, the oldest female was the head of the longhouse.

The Susquehannocks arrived from the north and occupied the Susquehanna Valley since at least 1150. Their earliest known village dates back to 1550. At the height of their power, during the early 17th century, their population numbered some 7,000 people.

The Susquehannocks were farmers, fishermen, and hunters. They planted corn, beans, and squash in the spring, then went south to the Chesapeake area to fish. They returned in the fall to harvest and hunt. Their first recorded European contact was with Captain John Smith in 1608 near the Chesapeake Bay.

"Susquehannock" was a descriptive term used by Smith's Algonquian-speaking guide to describe the tall Susquehannock he met. "Susquehannock" is an Algonquian word meaning "people of the muddy river," a reference to the Susquehanna River.

The Susquehannocks frequently fought with their neighbors, such as the Delawares (Lenni Lenape) to the east and the Powhatan Confederacy to the south. Although linguistically and culturally related to the Iroquois, the Susquehannocks were allies of the Hurons and bitter enemies of the Iroquois. During the first half of the 17th century, they were the only natives in the region to become major trading partners with the French, the English, the Dutch, and the Swedes. As such, the Susquehannocks made huge profits from the fur trade.

In their search for greater supplies of furs, the Susquehannocks became involved in increased intertribal rivalry between 1630 and 1700. As the Susquehannocks expanded their search for furs westward, they were drawn into the Beaver Wars (1641–1701), a period of intense native rivalry in the Great Lakes and Ohio River Valley region. Although primarily a competition between the Hurons and the Iroquois, the Susquehannocks contributed to the escalation of the conflict.

Because of their multiple alliances with European colonial powers, the Susquehannocks had more European weapons than any other natives in the region. They even possessed a cannon, a weapon not held by any other natives at the time. The Susquehannocks were placed in jeopardy when the Iroquois Confederation overwhelmed the Hurons in 1648–1649. The Iroquois had also been strengthened when they absorbed many of the defeated Hurons into their ranks. In 1651, the Mohawks attacked the Susquehannocks and fought a war with them that lasted until 1656. During the course of the war, the Susquehannocks were pushed farther south along the banks of the Susquehanna River.

In return for assistance from the English in Maryland, the Susquehannocks ceded much of their Maryland territory to the English in 1652. In 1654, a smallpox epidemic hit the Susquehannocks, which further weakened their ability to resist the Mohawks. The Susquehannocks also lost their major arms supplier when the Dutch seized the Swedish colony in Delaware in 1655.

Although the Susquehannocks eventually made peace with the Mohawks in 1656, the Iroquois attacked them in 1658. Another smallpox epidemic struck the Susquehannocks in 1661, further inhibiting their ability to withstand the Iroquois attack. In 1663, Maryland settlers, fearful of the Iroquois, provided the Susquehannocks with weapons. In 1664, however, the English took New York from the Dutch and formed an alliance with the Iroquois. Weakened by war and disease, the Susquehannocks were defeated by the Iroquois in 1675. They were also driven out of Pennsylvania.

The governor of Maryland then offered the Susquehannocks refuge on the upper bank of the Potomac River, much to the chagrin of the English colonists living there. The English colonists subsequently attacked the Susquehannocks, sparking the Susquehannock War (1675–1676). The Susquehannocks responded with retaliatory

raids on colonial settlements, but in 1676 they were forced to flee north. Ultimately, they either surrendered to the Iroquois or were dispersed among other regional natives.

The Iroquois resettled what was left of the Susquehannocks among the Mohawks and the Oneidas in New York. As such, they became part of the so-called Covenant Chain. In 1706, the Iroquois allowed 300 Susquehannocks to return to the Susquehanna Valley and establish the village of Conestoga. Quaker missionaries converted many of the Susquehannocks there to Christianity. In protest, the traditional Susquehannocks left to join the Mingos in Ohio. By 1763, there were only 20 Susquehannocks remaining in Conestoga. Although these 20 natives were living peacefully and causing no harm, the Paxton Boys, enraged by Pontiac's Rebellion (which did not involve the Susquehannocks) decided that all natives in the region were a threat and should be exterminated. Local officials arrested 14 members of the Conestoga community and placed them in a jail in Lancaster for their own protection. Meanwhile, the Paxton Boys killed the 6 Susquehannock Christians remaining in Conestoga. The Paxton Boys then proceeded to the Lancaster jail, where they murdered the remaining Susquehannocks.

Susquehannock War

Start Date: 1675 End Date: 1676

Frontier war between backcountry settlers in Virginia and Maryland and the Susquehannock Native Americans in the upper Potomac River region. In 1676, Virginia frontiersmen under the leadership of Nathaniel Bacon rebelled against their provincial government and burned Jamestown. The primary cause of their dissatisfaction was the colonial government's reluctance to prosecute a war between the backcountry inhabitants and the Susquehannocks, an Iroquoian people situated just north of the Potomac River.

The Susquehannock War began in 1675 when a dispute over stolen hogs escalated into a full-scale war. Virginia frontiersmen killed a group of Doeg natives who were trying to confiscate a farmer's hogs as payment for goods they had sold him. The killings set off a series of raids and counterraids. These quickly expanded to involve both Maryland residents and the Susquehannocks.

The Susquehannocks were relative newcomers to the upper Potomac River area. They had only recently accepted an invitation from Maryland to settle closer to their principal trading partners. Early in the conflict, Susquehannock leaders sought to negotiate a peaceful resolution. Nearly 1,000 Virginians and Marylanders led by John Washington, however, surrounded a principal Susquehannock town and murdered several Susquehannock headmen.

Outnumbered by the Virginians, the enraged Susquehannocks nonetheless wrought devastation across the Potomac frontier region, raiding and pillaging the settlers' isolated farms. Hard pressed by the natives, the frontier populace sought aid from the Virginia government. Colonial officials, fearful of potential disruptions in the profitable Native American trade, responded only with a bland and ineffective defensive strategy. Incensed, frontier settlers rallied around the leadership of Nathaniel Bacon, a young but out-of-favor Virginia aristocrat. Under Bacon's leadership, settlers began indiscriminately killing Native Americans—not only the hostile Susquehannocks but also friendly Algonquian-speaking groups such as the Pamunkeys and the Appomattocks.

Bacon's attacks greatly troubled Virginia lawmakers, who sought to avoid a general war with the natives. Thus, in early 1676 Gov. William Berkeley of Virginia declared Bacon an outlaw. That move touched off the brief but violent frontier uprising that bears Bacon's name.

Disaffected and disenfranchised frontier residents quickly rallied to Bacon's aid. In September 1676 his makeshift army chased Berkeley from Jamestown and then burned the town. However, Bacon died of dysentery only a month later and the rebellion quickly collapsed.

The Susquehannock War ended in 1676 as well. Reluctantly, the Susquehannocks migrated back into Pennsylvania, where they soon dispersed. Some joined the Delawares (Lenni Lenape) in southeastern Pennsylvania, whereas others were forcefully assimilated into the Iroquois Confederation and still others returned to their old home in the Susquehanna River Valley, where they became known as the Conestogas. After the war, the Susquehannocks in essence ceased to exist, reduced instead to a small constituency in other tribes or reconfigured as only a shadow of their former selves.

Sutler

Individuals who traveled with troops in the field and sold provisions and other goods to soldiers. Sutlers were vitally important to the morale of the troops as they sold quality-of-life items that were otherwise difficult for soldiers to acquire. Irregular pay meant that many soldiers were often unable to buy simple necessities from local merchants, who refused to extend credit to transient soldiers. Sutlers usually accepted credit, and typically they sold such items as tobacco, soap, paper, needles, thread, sugar, and tea.

Liquor was by far the most lucrative item sold by sutlers. Despite problems of drunkenness, it was impossible to outlaw alcohol among the troops. Moderate alcohol consumption was generally regarded as a cheap means of pacifying the troops. Sutlers were happy to meet the demand.

Most sutlers were men, but it was not unheard of for women during the colonial period to work as sutlers. Although they were important for troop morale, unscrupulous sutlers could also cause dissension. Some sold goods had been looted from civilians. Such plundering tended to increase when there were too many sutlers within a regiment.

In an attempt to maintain order, sutlers were usually required to register with the commanding officer of a unit. Efforts were made to ensure that they were of good reputation, and commanders impressed on them the need to charge fair prices for their goods if they were to retain the privilege of remaining with the unit.

Swansea, Attack on

Start Date: June 20, 1675 End Date: June 25, 1675

The opening attack of King Philip's War (1675–1676), carried out intermittently between June 20 and 25, 1675, by the Wampanoags. The attack on Swansea convinced the New England colonies that the Wampanoags were hostile, igniting war between the two groups.

Swansea, a Plymouth Colony village, lay on the border between English and Wampanoag lands. On June 20, 1675, Wampanoag warriors began to loot and burn outlying Swansea farms. The farmers fled north to Swansea proper and alerted their neighbors, who sent for aid and then retreated to their garrison houses. Colonial militiamen from nearby Bridgewater and Taunton arrived on June 21. In the meantime, the Wampanoags had left the area.

Evidence of what happened next is scant and contradictory. Apparently, on June 23 Wampanoag looters returned to Swansea. In the process, a Plymouth youth shot and killed one warrior. The following day Wampanoag parties ambushed several groups of colonists that had left their garrison houses. Nine English settlers were killed and two were mortally wounded. These deaths persuaded the governments of Plymouth and Massachusetts Bay that the Wampanoags intended a full-scale war, and colonial militias mustered accordingly.

Metacom (King Philip), the Wampanoag sachem, had been preparing for war against New England for some time. However, it seems unlikely he would have chosen to begin the war in such fashion. Probably disaffected Wampanoags attacked Swansea on their own initiative, sparking the conflict before Metacom had intended.

Sweden

Northern European nation encompassing both Scandinavian and Baltic territories. On the eve of Sweden's colonial venture in North America, Swedish territory covered roughly twice as much area as it does today. It included Finland (part of Sweden since the 12th century), Estonia, part of Latvia, and much of the Baltic coast.

Sweden seceded from union with Denmark and Norway in 1523. More than a century of struggle ensued as Denmark tried to force Sweden back into the union. The long years of war allowed the Swedish nobility to amass great estates. The Crown gave land to the nobility in return for their support, and freeholders crushed by war taxes sold land to the nobles. The peasants who farmed these estates were called "freemen," but unlike serfs, they were permitted to live as tenant farmers where they chose. Sweden remained a largely agrarian nation. Less than an eighth of its population (approximately one million) lived in towns. Sweden possessed abundant timber, iron, and copper, which it traded abroad for finished goods.

Woodcut by A. C. Cady showing Peter Minuit, director general of the Dutch colony of New Netherland, contracting for the purchase of Native American lands. (Library of Congress)

King Gustavus Adolphus (1594–1632) was 16 years old when his father died in 1611. He inherited a kingdom at war with Denmark, Poland, and Russia. Count Axel Oxenstierna, then 28 years old, became the new king's most influential adviser.

As he came to terms with his enemies, Gustavus Adolphus built his inadequate forces into a disciplined professional army. He also modernized the musket, developed the concept of mobile artillery, and revolutionized infantry and cavalry deployment. In 1630 he brought Sweden's armed might to bear on the floundering Protestant side in the ongoing Thirty Years' War (1618–1648). Gustavus Adolphus landed some 13,000 soldiers and swept through Germany routing the imperial (Holy Roman Empire) forces opposing him. He died in battle in 1632.

Fear of Sweden's military might bears much of the credit for New Sweden's ability to survive in North America for as long as it did. However, decades of warfare depleted the national treasury and decimated generations of young men. More than 120,000 Swedes and Finns died in wars during the first half of the 17th century.

Sweden under Gustavus Adolphus took control of the Baltic coast, including Latvian and Prussian ports. However, the Dutch

dominated trade in the area by virtue of their central location and the skill of their mariners and merchants. Dutch vessels carried most of Sweden's foreign trade. As the Dutch played such a leading role in Swedish commerce, so they also loomed large in the founding of New Sweden. Shortly before his death, King Gustavus Adolphus granted a trading company charter to a group of Dutch merchants. However, they failed to raise enough money for an expedition.

The king's daughter and heir, Christina (1626–1689) became queen-elect at the age of six. A regency led by Axel Oxenstierna ran the government until Christina ascended the throne in 1644. In the meantime, several Swedish government officials, in cooperation with Dutch merchants, formed the New Sweden Company in 1637. The company, led by Peter Minuit, established an American colony in the vicinity of the Delaware River Valley for the dual purposes of fur trading and raiding the Spanish colonies.

New Sweden's proprietors attempted to organize the colony according to the same feudal system that existed at home, with peasants working on company-owned estates. Few Swedes were motivated to leave Sweden only to be tenants somewhere far away, however. Thus, the company resorted to the forced expatriation of

petty criminals and army deserters. New Sweden failed to show a profit, and its small population dwindled through death and desertion to neighboring colonies. In 1641 the Swedish Crown acquired from the disaffected Dutch investors their shares in the New Sweden Company, and ran the company virtually as a department of the national government.

Queen Christina had little interest in Sweden's colony on the far side of the Atlantic and ignored New Sweden for several years. Eric Oxenstierna, Axel's son, persuaded her to send another expedition to New Sweden in 1653. The following year, having secretly converted to Catholicism, she abdicated and was succeeded by her cousin, King Charles X. Sweden's official role in colonial America ended on September 15, 1655, when Gov. John Classon Rising surrendered New Sweden to New Netherland. This was the result not only of neglect on the part of the Swedish Crown, but also of simmering hostilities with a much-better-armed and supplied New Netherland.

Swedes in America

From 1638 to 1655, a number of Swedes emigrated to North America with the New Sweden Company, settling primarily along the Delaware River in present-day Delaware, New Jersey, and Pennsylvania. Although individual Swedes and their families had emigrated from Sweden prior to the establishment of New Sweden, that colony of 800 people represented the largest single Swedish settlement in America during the colonial period. By 1697, according to church records, an estimated 2,000 North American colonists spoke Swedish.

Swedes who moved to the New World came mostly from central areas of Sweden such as Stockholm, Uppland, and Västergötland. Finns living in Sweden also moved to New Sweden. Johan Björnsson Printz, governor from 1642 to 1654, sought settlers for New Sweden who could earn income for the company. Immigrants represented a variety of social classes, ranging from nobles to peasants. Mostly agrarians, Swedes were also skilled craftsmen and artisans whose methods and traditions impacted American culture in myriad ways. Although many early Swedish colonists had military experience, most were simply farmers, traders, or

other types of workers. Because so few Swedes wished to emigrate, a number of convicts were recruited to boost New Sweden's population. Most seem to have behaved lawfully in their new environment and, for the most part, the other colonists did not ostracize them.

Those Swedes who decided to emigrate endured a lengthy, miserable trip across the Atlantic and risked many hazards. One of 12 ships sailing to New Sweden wrecked in a storm, and the Dutch seized another. The Swedes brought with them to North America supplies, livestock, and belongings that they hoped would help them prosper in unfamiliar surroundings. In North America, they purchased maize from natives and learned to grow native crops. Their pastors assured the Swedes that they could continue practicing their Lutheran faith in the colony.

New Sweden's settlers pursued the company's commercial goals by building trading posts to purchase skins and pelts from natives. These goods were then shipped to European markets. Other colonists focused on raising food crops. Swedish officials urged the farmers to plant tobacco instead of grain, hoping to reap the profits enjoyed by the English colonists of Maryland and Virginia. The soil and climate in New Sweden were not suited to produce high-quality tobacco, however. Farmers planted mostly grain. They received only minimal funding from the New Sweden Company and Swedish officials, so much of their agriculture was subsistence farming. Swedes generally lacked sufficient tools and animals to pull cultivating and harvesting equipment. However, they proved resourceful in improvising required items from available materials. Swedish farmers also processed grain into beer.

Some Swedes became quickly dissatisfied with New Sweden's government. This was especially the case with Governor Printz, who sought to evict the natives forcibly from their lands. Some of the disaffected moved to Maryland or returned to Sweden. After the defeat of New Sweden by New Netherland in 1655, some Swedes returned to Sweden. Many others stayed on in America, however, even encouraging additional Swedes to emigrate. Many Swedes settled in New York City, most of them sailors and ship workers. Both the Dutch and the English communities welcomed Swedes, who gradually became assimilated in colonial society.

Other colonists adopted the Swedes' use of log architecture, devising such structures as log cabins for convenient shelter. Swedes built churches incorporating native design elements from Sweden for their Lutheran religion. The principal Swedish congregations were Christina (Delaware), Penn's Neck and Raccoon (New Jersey), and Wicaco (Pennsylvania). Some 1,300 Swedes belonged to the three congregations in 1754.

Some Swedish clergymen converted Delaware (Lenni Lenape) natives to Christianity. Rev. Johan Campanius, New Sweden's pioneering Lutheran minister, immersed himself in native culture and become fluent in the dialect. He put together a Lenni Lenape dictionary and prepared a catechism translation.

770 Swedes in America

The Swedes assimilated well into American society. William Penn admired their farming skills, which benefited Pennsylvania. Swedes milled grain, tooled leather, and made bricks. Many were shipwrights who helped build the vessels that filled colonial harbors.

Today the American Swedish Historical Museum in Philadelphia and the New Sweden Company replica farmstead in Bridgeton, New Jersey, preserve information and artifacts related to colonial Swedes.

T

Talon, Jean-Baptiste

Born: Late 1625

Died: November 24, 1694

French Army administrator and intendant of New France (1665–1668, 1669–1672). Born in late 1625 and baptized on January 8, 1626, in Châlons-sur-Marne, France, Jean-Baptiste Talon pursued extensive studies in Paris before entering the military administrative services at age 28. Rapidly earning royal favor, Talon became army commissary in Flanders and a quartermaster general in 1653, commissary for the city of Le Quesnoy by 1654, and intendant (chief administrator) for the province of Hainaut the following year.

Named intendant of New France on March 23, 1665, Talon landed at Quebec on September 12. He was to become one of the most inventive and ambitious civil administrators in the history of the colony. Talon undertook and partly achieved the transformation of a small outpost into a profitable royal province, one that was well populated and capable of defending itself.

As intendant, Talon oversaw the lodging and supplying of the newly arrived Régiment de Carignan-Salières. He was also responsible for the logistics of the campaigns against the Iroquois during the winter of 1665–1666 and the autumn of 1666. In the wake of the resulting peace accord, he orchestrated the settlement in the colony of over 400 soldiers and officers. Recalled to France in November 1668, Talon's commission was renewed on May 10, 1669. However, his return to the colony was delayed until August of the following year.

During his tenure in New France, Talon remained preoccupied with the safety of French traders and the prevention of English expansion. In so doing, he advocated a movement of western exploration and the establishment of posts on Lake Ontario. Talon, who was the first royal-appointed intendant of New France, had author-

ity over all judicial and civil affairs. As such, he was responsible for colonial expenditures—including military budgets—public safety, sanitation, public health, and the regulation of trade.

Sailing from the colony for the second and last time in November 1672, on his return to France Talon was rewarded with the title of Comte (Count) d'Orsainville. He spent the remainder of his career as valet and secretary to King Louis XIV. A highly influential man at court, Talon died in Paris on November 24, 1694.

Tanaghrisson (Half-King)

Born: Unknown Died: Late 1754

Catawba-born Seneca leader and diplomat in the Ohio Country. The Iroquois seized Tanaghrisson during his youth and raised him as a Seneca. As with most Iroquois men who aspired to positions of leadership, Tanaghrisson had a career as a warrior, but he did not attract the attention of the English and the French until he became a diplomat.

In the wake of the Walking Purchase of 1737, the Iroquois, acting on the behalf of Pennsylvania, ordered the Delawares

(Lenni Lenape) to the westernmost reaches of the colony. At the same time, the Iroquois also assigned "supervisors" who would keep an eye on the Lenni Lenape, Shawnee, and Mingo peoples in the Ohio Country and report on their activities. The English and French referred to these administrative diplomats as "half-kings." When a half-king died, the Iroquois resuscitated the title and bestowed it on the man they selected as the new supervisor. Sometime in the late 1740s, the confederation council at Onondaga assigned Tanaghrisson to oversee the Mingo village of Logstown in what is now western Pennsylvania.

The English quickly recognized Tanaghrisson as authorized to speak for the English-allied tribes in the Ohio Country. As such, Conrad Weiser, Pennsylvania's representative to the Iroquois, negotiated with him, as did English trader George Croghan. And Virginia agents treated with Tanaghrisson in 1752.

Tanaghrisson most probably would have remained relatively unknown to most historians. However, in the last year of his life he participated in an action that ignited a global conflict. An English partisan, Tanaghrisson was concerned with the dispute between the French and the English over control of the Ohio Country and resented what he regarded as French intrusions. As a half-king, Tanaghrisson's authority rested in part on the acquiescence of the Delaware and Shawnee peoples he purported to lead. Their cooperation resulted from what he could provide them in the way of English trade goods, which were often of much better quality than comparable French wares.

Based on a 1744 treaty with the Iroquois, Virginia also laid claim to the Ohio Country. Troubled by French activity in the area of the Monongahela River and the Allegheny River, Gov. Robert Dinwiddie of Virginia dispatched a mission led by Lieutenant Colonel George Washington to demand that the French leave.

However, Washington and his men could not locate the French. At that point, they met Tanaghrisson and some of his Mingo warriors, who led them to the French encampment. Tanaghrisson and Washington's men encircled the French position and opened fire. The French soon surrendered, ending what came to be known as the Battle of Jumonville's Glen. Washington learned from the French officer in charge of the detachment that his was a diplomatic mission, sent to tell the British that this was the territory of the French king. To the surprise of Washington and the other Virginians, Tanaghrisson and his warriors began killing the wounded Frenchmen, including the officer in charge. Afterward, Tanaghrisson and his men accompanied Washington to the newly constructed Fort Necessity. But Tanaghrisson realized that the position was not defensible and he and his warriors departed before the French attacked the post. Tanaghrisson fell ill and died in late 1754.

Teedyuscung

Born: ca. 1700 Died: April 19, 1763

Delaware (Lenni Lenape) sachem, or chief, who rose to prominence rather suddenly in the mid-1750s, on the onset of the French and Indian War (1754–1763). Teedyuscung was born sometime around 1700, probably near Trenton, New Jersey. Before the 1750s, he made a marginal living making brooms and baskets for English settlers in New Jersey. Teedyuscung became a Moravian Christian convert in 1755, taking the name Gideon. Disliking the life of a convert, he soon left the Moravians. Teedyuscung then settled with other Delaware peoples along the Susquehanna River.

In December 1755, at the start of the French and Indian War, Teedyuscung led a successful war party against the English, striking across the upper Delaware River. The English soon retaliated, driving most Delawares deeper into the French camp. Teedyuscung then reversed course and opened peace negotiations with Pennsylvania on behalf of the Susquehanna Delaware. Assuming a leadership role—despite his lack of any hereditary claim to do so—Teedyuscung used the negotiations as a platform on which to challenge the terms of the 1737 Walking Purchase, a controversial land acquisition agreement between Pennsylvania and the Delaware tribe.

Teedyuscung also used his newfound influence to challenge the Iroquois' domination of the Delawares. Bombastic, and with a profound liking for liquor, Teedyuscung boasted that he represented 18 Native American nations, and he insisted that he be provided a clerk to record conference minutes.

Pennsylvania authorities doubted Teedyuscung's claims. Be that as it may, he knew he had the backing of politically powerful Philadelphia Quakers. The Quakers hoped that Teedyuscung's allegations about the Walking Purchase would embarrass the colony's proprietors, the non-Quaker heirs of William Penn.

The matter soon came to the attention of the Privy Council, which then ordered Sir William Johnson, the British superintendent of Indian Affairs for the northern colonies, to investigate. Johnson, who had close ties to the Iroquois, depicted Teedyuscung as a drunkard and blamed the Quakers for the controversy, accusing them of having inflamed the Delawares. Iroquois representatives also attempted to discredit Teedyuscung, arguing that he did not

have any real authority. Teedyuscung then backed away from his accusations, stating that the Quakers had misled him. Pennsylvania's governor subsequently presented him with gifts to distribute to his followers, whom many viewed as a reward for withdrawing his claims regarding the Walking Purchase.

By 1760 or so, Teedyuscung had asked Pennsylvania to deed land to the Delawares in Pennsylvania's Wyoming Valley. The colony did send laborers to build cabins for the Delawares. However, this was really an attempt to thwart Susquehanna Company claims to the area. Teedyuscung perished in Wyoming on April 19, 1763, when his cabin burned down. Many historians suspect that arson was the cause of the fire, with the Iroquois and the Susquehanna Company the most likely suspects.

Tequestas

An Arawak-speaking group of Native Americans who lived along the Miami River and on the coastal islands of southeastern Florida. Estimates of the Tequestas' (also spelled Tekestas) numbers at the time of European contact vary from 1,000 to 5,000. In large part, this wide variance is because the Spanish did not clearly distinguish between them and their more powerful neighbors, the Calusas. Europeans usually interacted only with the villages along the Atlantic shore, but it is believed that Tequesta villages may once have stretched far inland, into the Everglades.

The Tequestas showed a high degree of technical sophistication, as demonstrated by the 1998 archaeological discovery of the "Miami Circle," a stone arrangement 38 feet across. Post holes around the perimeter have led to speculation that it may have been an imposing ceremonial structure.

Early relations between the Spanish and the Tequestas varied widely between open hostility and peace. Juan Ponce de León encountered the Tequestas in 1513 and believed that he established peaceful contact. In 1521, however, Ponce de León was fatally wounded in a clash with a Calusa force that may also have included Tequesta warriors.

In 1565, Gov. Pedro Menéndez de Avilés attempted to repair the relationship with the Tequesta by leaving Francisco de Villareal and a company of soldiers to construct a mission in a Tequesta village. Villareal erected crosses and built meeting huts for converting the natives.

However, the Tequestas and the Spanish were soon again at odds. For unknown reasons, the Spanish garrison killed an important tribe member in 1568. In response, the Tequestas tore down the crosses, burned the meeting huts, and harassed Spanish soldiers. Whenever the Spanish attempted to leave the village to forage or retrieve water, the Tequestas ambushed them. Finally, Villareal and the Spanish company decided to abandon the settlement for the safety of Santa Lucia. Another attempt, in 1569, to build a missionary station also ran afoul of intercultural tensions. The Spanish withdrew entirely the following year.

Once a real power in the region, the Tequestas were already in decline when the Europeans arrived, mainly because of competition with large, aggressive rival tribes. The Tequestas continued to dwindle in number and importance in the 17th century. European diseases weakened them further, as did ongoing warfare with the more numerous Calusas. The Tequestas also drew the ire of the Spanish from time to time for taking in runaway African slaves and hiding them from their masters.

The Tequestas' decline accelerated further in the 18th century. In 1704, an English raid destroyed Tequesta settlements near the mouth of the New River. When Spain formally ceded Florida to the British in 1763, the Tequesta population stood at only a few hundred people. The majority of these soon successfully petitioned the Spanish to resettle them in Cuba. The remnants left behind in Florida assimilated into surrounding tribes.

Texas

Spanish-held province, known to the Spanish as Tejas. During the colonial wars in North America, Texas served as a buffer province between Spain and New France. Geographically, the region did not have the same composition as the modern state. Instead, the region considered Texas during colonial times was composed of the eastern half of the modern state of Texas and western Louisiana. Both Spain and France controlled different regions of Texas. The Spanish occupied the western half of the region, and the French held the eastern half.

During the colonial period, the desire of the European powers for territory and the search for profit largely determined the situation in Texas. The result was constant tension and fighting between the French and the Spanish over control of the territory and of trade with the region's Native Americans.

774 Theyanoguin (Chief Hendrick)

There were approximately 20 native groups and subgroups in Texas during the colonial period, but those who had the most interaction with the French and the Spanish were the Caddos of eastern Texas, the Atapakans and the Karankawas along the Gulf Coast, the Coahuiltecans in southern Texas, the Wichitas and the Tonkawas in central Texas, and the Jumanos and the Apaches of western Texas. In addition, after the Spanish introduced the horse to the New World, the Comanches and the Kiowas of the north Texas plains and panhandle region would emerge as feared enemies whose raids would terrorize settlements in Texas and northern Mexico until the second half of the 19th century.

Alonso Alvarez de Pineda made the first Spanish foray into Texas in 1519. After claiming the territory, Spanish authorities attempted to control Texas by establishing a series of missions and presidios across the region. The presidios served the dual purpose of protecting the missionaries and, more importantly, preventing French traders from encroaching on Spanish territory. Missions and presidios proved to be a financial burden to the Spanish government, but they were nevertheless essential to maintaining their claim.

From the eastern half of Texas, the French attempted to encroach on Spanish territory through trade with Native Americans in Texas. French traders entered Texas and established trading posts, not only for profit but also to exert control over the region. The most noted of the trading posts was Natchitoches, founded by French explorer René-Robert Cavelier, Sieur de la Salle, in 1687. France resorted to other means to claim Texas, which evolved from a plan originated by La Salle. The explorer had planned to conquer Spanish Texas by establishing a line of forts along the Mississippi River, then use these as secure bases from which to invade the Spanish holdings. His plan was never implemented, however. Instead the French attempted to establish their influence by introducing colonists. The last major attempt in this regard involved a group of Napoleonic exiles in 1818 who settled along the Trinity River near the present-day city of Liberty, Texas. Because of poor planning, food shortages, and the constant Spanish threat, the French ultimately abandoned the colony.

Disputes over Texas finally ended in 1763, when France ceded the Louisiana Territory to the Spanish following their defeat in the French and Indian War (1754–1763). No longer concerned with competition for control of Texas, Spanish officials lost interest in the province. Eventually, Spain moved most of its missionaries and soldiers out of the region to ease the financial burden on the government. Spain remained in control of Texas until 1821, when the Mexican people under the leadership of Agustín de Iturbide and Vicente Guerrero successfully revolted and gained their independence from Spain and formed the nation of Mexico.

Although a frontier region in the period, Texas played a major role in the development of Colonial North America. The disputes between the French and the Spanish spurred further exploration and shaped the history of the state. Today, the colonial period provides some of the most colorful history of Texas. And the cities and

missions established several hundred years ago played important roles in some of the most defining events in Texas history.

Theyanoguin (Chief Hendrick)

Born: ca. 1680

Died: September 8, 1755

Mohawk sachem (chief), warrior, orator, and diplomat as well as a notable ally of British settlers and interests in western New York and beyond. Theyanoguin (Deyohninhohakarawenh) was born in western Massachusetts about 1680 to a Mohegan father and Mohawk mother. Both tribes being longstanding allies of Dutch colonists in New York and English settlers in New England, Theyanoguin was raised in the tradition of friendship with those two colonial powers—including conversion to Anglicanism and adoption of an English name, Hendrick, around 1690. During the next 60 years, this Mohawk sachem played a major role in bringing about the destruction of New France, epitomizing his Iroquois name, which translates as "the western door is open."

Despite his allegiance to the English, Hendrick's first loyalty was always to his own people. In 1698, he joined another Christian Mohawk in accusing English and Dutch speculators of fraudulent land claims and in getting those claims overturned by the governor of New York, Richard Coote, Earl of Bellomont. Three years later, Theyanoguin worked with other Iroquois chiefs to conclude a pact of neutrality with New France.

For the most part, however, Chief Hendrick was a friend to the English colonists, in peace and war alike. In 1709, he participated in an abortive attack on New France, and he visited England the following year. There, Theyanoguin obtained permission from Queen Anne to serve as a lay preacher for the Church of England. On returning from London, Theyanoguin settled and grew apples along the Mohawk River, near the mouth of East Canada Creek, and spent much of the succeeding 30 years preaching and consolidating his power.

It was after a second visit to London in 1740 that Theyanoguin truly distinguished himself as a friend of Great Britain. During King George's War (1744–1748), he led a negotiating party to Montreal to plead for peace. There he accepted French gifts and then attacked

a French outpost at Île Lamothe in present-day Vermont. His warriors also aided Colonel William Johnson's attack on Montreal in 1746, and they harassed French forts and military expeditions in the region around Lake Champlain.

Following King George's War, Theyanoguin looked westward and attempted to enlist British support against French expansion into the Ohio Valley. For several years, his calls went unheeded and Theyanoguin drifted somewhat from his traditional allies. The rift came to a head at the Albany Congress in June 1754, when Theyanoguin, now chief sachem of the Mohawk, chastised the British colonials: "Look at the French.... They are fortifying everywhere; but, we are ashamed to say it, you are... bare and open, without any fortifications. It is but one step from Canada hither, and the French may easily come and turn you out of doors."

Shortly thereafter, the British colonists received substantial assistance from the mother country to challenge the French, including 1,000 men of the 44th and 48th Regiments under Major General Edward Braddock, the new commander in chief in North America. Braddock decided to launch four simultaneous attacks in 1755, with Theyanoguin joining Colonel William Johnson in an expedition against Crown Point.

At the Battle of Lake George on September 8, 1755, Theyanoguin's Mohawk warriors were among the first to be attacked on the "Bloody Morning Scout." Theyanoguin himself became separated from the main body in the disorderly retreat and was subsequently killed and scalped by some of his own distant brethren, the Caughnawagas, Iroquois allies of the French. Theyanoguin was not forgotten, however; his fellow Mohawks continued to serve the British with distinction throughout the French and Indian War and helped open the door to westward Anglo-American expansion.

Timucuan Revolt

Event Date: 1656

Violent uprising of the Timucuas, a loose confederation of Native Americans inhabiting northern Florida and southern Georgia against the Spanish in 1656. After first contact with the Spanish in the 16th century, the Timucuas permitted the establishment of Franciscan missions throughout their territory. The Spanish paid Timucuas affiliated with the missions to clear roads, supply crops, and build new missions. The missions came at a terrible cost in terms of the spread of deadly disease, however. The Timucuas may have lost half their population to epidemics between 1612 and 1616.

By the mid-17th century, tensions between the Spanish and the Timucuas were mounting. Food shortages, disease, and the demoralizing effect of Spanish authority had eroded the authority of the Timucua chiefs. The Spanish governor, Diego de Rebolledo, also regularly requisitioned Timucua men for service at the Castillo de San Marcos in St. Augustine. Many Timucuas resented such servitude and disliked Spanish intrusions into their affairs.

In early 1656, Rebolledo, fearing an attack by the English, summoned an additional 500 men, including the chiefs, from the Timucua and Apalachee provinces. The men were instructed to carry their own food and supplies with them. Timucua society was highly stratified, and the suggestion that chiefs should carry their own food was an affront to their status as leaders.

Timucua chief Lúcas Menéndez refused to send his warriors and encouraged other chiefs to rebel against the Spanish. Careful not to disavow loyalty to the Spanish king or the Franciscan friars, the Timucuas limited their assaults to Spanish soldiers. They attacked only sporadically, but the violence led to seven Spanish deaths in three separate skirmishes. Thereafter, the Timucuas abandoned the missions and left the fields unplanted.

In the meantime, the ringleaders of the revolt constructed a small palisaded fort and attempted to spread the rebellion to neighboring Apalachee tribes. Their efforts failed, for most Apalachees anticipated Spanish retaliation.

Because Rebolledo refused to be diverted from his defensive preparations against an English assault, the insurrectionist Timucuas had time to fortify their palisade. The fort proved a doubled-edged sword, however. Although offering a degree of protection for the rebels, it also concentrated them in a single location, ultimately making it easier for the Spanish to suppress the rebellion.

After several months of tension, rank-and-file Timucuas began losing faith in their leaders. Rather than spreading the rebellion to neighboring tribes, the rebellion appeared to have driven the Apalachees into an even tighter alliance with the Spanish, leaving the Timucuas dangerously isolated.

Four months passed before Rebolledo turned his attention to the rebellious Timucuas. He then sent 60 Spanish soldiers to suppress the revolt and persuade the Timucuas to return to the missions. The Spanish offered negotiations rather than warfare, which the Timucua leaders reluctantly accepted. Most of the rebels were allowed to disperse. But the Spanish placed the chiefs and principal warriors on trial. Ultimately, the Spanish executed 11 Timucuas and sentenced another 10 to hard labor at St. Augustine. The bodies of the executed chiefs were publicly displayed near their villages.

The revolt accelerated the destruction of Timucua culture. The demoralizing defeat, ongoing epidemics, and periodic slaving raids from the Caribbean whittled away the vitality and population of the villages. When Spain ceded Florida to England in 1763, it is believed that there were only 89 surviving Timucuas.

Tolomato Presidio (Georgia)

A Spanish presidio (frontier fort) associated with a Franciscan mission to the Guale tribe. First built in 1595, Tolomato Presidio was probably located on a bluff overlooking a branch of the Altamaha River at present-day Darien, Georgia, near the coast. There were at least seven buildings associated with the presidio, including the fort and adjacent barracks. As in other Spanish presidios, manpower was usually in short supply.

Pedro Ruiz founded the original presidio in 1595 at the Guale village of Tolomato. In 1597 a Guale chief known as Juanillo led a rebellion at Tolomato because of Father Pedro de Corpa's efforts to prevent his accession to the position of head chief. The rebels destroyed the Spanish missions in Georgia and killed most of the mission priests. Spanish and allied Native American forces finally suppressed the rebellion in 1601.

Franciscan missionary Diego Delgado rebuilt the mission and presidio in 1605. Guale converts, who had been permitted to remain on their own territory before the rebellion, were now compelled to live in mission villages. This concentration of the population, however, contributed to the spread of epidemics.

Although the Spanish had dealt with English traders and raiders for some time, the founding of Charles Town (now Charleston, South Carolina) in 1670 directly threatened Spain's domination of the area. In 1670, England abandoned its claim to lands south of St. Helena Sound (now in South Carolina). The Carolina colony nonetheless launched an aggressive campaign against the Spaniards, particularly after 1680. It included an anti-Spanish alliance with the Yamasees, direct attacks on Spanish missions, and the capture of mission natives and their sale into slavery. By 1686, the Spanish had abandoned all the missions and presidios in Georgia, including Tolomato. The Carolinians erected Fort King George opposite the probable site of Tolomato Presidio in 1721.

Tomahawk

Derived from the Algonquian words *tamahak* or *tamahakan*, which designates a type of cutting tool, the colonial tomahawk was primarily a melee and missile weapon used by Native Americans. Tomahawks generally resembled lightweight hatchets. Initially, natives sharpened bone, stone, or wooden blades and fastened them to short wooden handles. However, European colonists introduced

Contemporary illustration of early Mohawk Native American weapons: a deer-shank tomahawk and a scalping knife. (North Wind Picture Archives)

superior iron and brass blades and themselves began using the weapons for military, trading, and other practical purposes. Well-crafted tomahawks remained prized trade items well into the 19th century. In the 21st century, armies continue to employ them as both tools and weapons.

Although the colonial tomahawk traditionally served as a hand or short-ranged missile weapon, it also had other purposes. American Indians and colonists both used tomahawks as tools in everyday work. Natives in particular employed them as ceremonial objects and symbols of leadership. Some natives equipped tomahawks with pipe bowls and hollow stems to create smoking pipes. Others elaborately decorated ceremonial tomahawks for burial, to signify peace with an enemy. Although certainly not used solely by Native Americans, the tomahawk has become a popular—and stereotypical—symbol of native culture alongside the tipi and the feathered headdress.

Tomochichi

Born: ca. 1650

Died: October 5, 1739

Yamacraw (Creek) chief who allied with the English and served as emissary to Gov. James Oglethorpe of Georgia. Little is known about the majority of the life of Tomochichi (also Tomochachi). He was born about 1650 and apparently spent most of his years among the Creeks in the vicinity of southern South Carolina and Georgia as a warrior and a leader. Tomochichi participated in the Creek negotiations with South Carolina in 1721. But around 1728, he broke off from the Creek tribes to form his own band and relocated with them farther east.

Accompanied by about 200 followers of both Creek and Yamasee descent, Tomochichi settled along the Savannah River, near the present-day site of Savannah, Georgia. Once there, he negotiated with the officials of South Carolina to secure ownership of the territory and cement peaceful relations. As leader of this small

Yamacraw (Creek) chief Tomochichi, who allied with the English and served as emissary to Georgia governor James Oglethorpe. Wood engraving, American, 1887. (North Wind Picture Archives)

band called the Yamacraws, Tomochichi remained in contact with nearby traders and maintained cordial relations with the English. When Oglethorpe founded Georgia in 1733, he immediately sought out Tomochichi to secure his support and friendship for the new settlement.

In the earliest years of the nascent colony, Tomochichi proved a staunch ally and provided invaluable assistance to Oglethorpe. The Yamacraws welcomed the English to the immediate area and signed a treaty of friendship with them on May 18, 1733. They also served as hunters, fishers, and guides for the colonists.

Tomochichi himself intervened for peace and justice whenever problems arose. Peace with the larger Creek Nation was accomplished primarily through Tomochichi's negotiating on Oglethorpe's behalf. As his ally and personal friend, Tomochichi traveled with Oglethorpe first to Charles Town (Charleston) in March 1733 and later to England as an emissary to meet with King George II in the summer of 1734.

The visit to England reinforced the alliance between the English and the Yamacraws, and Tomochichi became convinced that his people should learn as much as they could of the white, English culture. In 1735, Tomochichi teamed with John Wesley, among others, to establish a school for the Yamacraws where they could learn the English language and religion. When political problems between the English and the Spanish developed in 1735, the Yamacraws served as military allies of the English.

Four years later, Tomochichi was again an important force in strengthening the British alliance with all the Creek tribes. Their loyalty to the British was reconfirmed with the Treaty of Coweta on August 21, 1739, which was the last great diplomatic achievement of Tomochichi. Before his death on October 5, 1739, near Savannah, Georgia, Tomochichi requested that he be buried within the town of Savannah near his English friends, and they happily complied.

Townshend ActsEvent Date: July 1767

A series of measures passed by Parliament in July 1767 that placed duties on certain goods imported into Britain's American colonies, reorganized the colonial customs service, and punished the New York Assembly for failing to comply with the Mutiny Act (Quartering Act) of 1765. Named for Charles Townshend, Britain's chancellor of the exchequer, the acts proposed to raise revenue to pay for

Sons of Liberty flyer from 1770, issued in protest of the Townshend Acts of 1767. (Library of Congress)

colonial administration and to reaffirm the authority of the Crown in colonial affairs. They were designed to pay heed both to colonial opposition to "internal" taxation of the colonies by Parliament and to the budgetary realities of the British government. Nevertheless, they were condemned by colonists and their passage increased tensions between England and the colonies.

The first of these bills was the Revenue Act of 1767. In response to domestic economic problems, Parliament reduced the English land tax, thereby removing approximately £400,000 from the government's revenue. Faced with this reality, Townshend hoped to increase the minuscule revenues from the colonies, which were providing only about £2,000 annually. King George III signed the act into law on July 2, 1767. The Revenue Act imposed customs duties on glass, lead, paints, paper, china earthenware, silk, and tea imported from Britain into the colonies.

According to Townshend, the expected revenues from the impost would be used to help pay the salaries of royal governors and judges, and to defray the cost of defending the colonies. The act was

in part an attempt to make British officials independent of colonial legislatures so that they would enforce Parliamentary authority more effectively. In addition, the act authorized the use of writs of assistance in the monitoring and seizure of contraband goods. These general warrants gave customs officers great latitude in searching both vessels and buildings for illegal or undeclared goods. The act thus rectified a controversy that had erupted in the colonies over which courts could issue such orders. On this point, it stipulated that warrants could be issued by the superior or supreme courts of the colony.

The second Townshend Act created the American Board of Customs in the colonies to assure the enforcement and collection of the new duties. In January 1767, the British Board of Customs reported that the great distance between England and the colonies, the lack of supervision of colonial officers, and the hardships under which they worked prevented effective enforcement of the law. Also, many customs officers were being harassed, fined, or imprisoned by local authorities when they attempted to carry out their duties. Head-quartered in Boston, the new board would oversee the collection of customs fees and monitor officials. Parliament increased the number of courts of admiralty to prosecute smugglers as well. The new courts would more effectively enforce British authority because, like royal courts, they were free from interference from provincial legislatures and they could sit without a jury.

The third measure of the Townshend Acts was the New York Restraining Act. This bill suspended the New York Assembly for failing to comply with the Mutiny Act of 1765. That act required colonies to provide funds to cover the cost of housing British troops stationed within their boundaries. In 1766, the New York Assembly had refused to fulfill all the requirements of the Mutiny Act because the legislators considered it an unconstitutional tax and the measure placed no limits on the number of troops a colony would be required to support. The New York Restraining Act, however, never went into effect. Previous to its passage, the assembly appropriated £3,000 to satisfy the requirements of the Mutiny Act.

The colonial response to the Townshend Acts was gradual. It followed a course from philosophical denunciation to political action and economic retaliation. Opposition first emerged in a widely read pamphlet titled *Letters from a Pennsylvania Farmer*. Its author, John Dickinson, argued that the acts undermined colonial liberties, increased the danger of martial law, and would establish a precedent leading to even more taxation.

Politically, the Massachusetts legislature led the way when it issued a circular letter on February 11, 1768. Largely the work of Samuel Adams, the letter affirmed the position of Dickinson and encouraged resistance to the Townshend Acts. As a result, Gov. Francis Bernard dissolved the Massachusetts legislature, and as violence against customs officials increased, the British moved more troops to Boston in October 1768. At its next session, the legislature further denied Parliament any power in the colonies when it declared that no person could be bound by a law that he, or his representative, did not consent to in person.

Revenue Raised in the Colonies by British Taxation

Act	1765	1767	1679
1673 Navigation Act	£2,954	£3,905	£1,294
1764 Sugar Act	£14,091	£33,844	£39,938
1765 Stamp Act	£3,292	N/A	N/A
1767 Townshend Acts	N/A	£197	£5,561

As the political crisis intensified, economic measures eventually brought an uneasy resolution to the conflict. Colonists boycotted British goods through non-importation agreements and intimidation. Merchants across the colonies agreed not to import British goods and women made purchasing locally produced goods a political statement. Colonists dressed in homespun clothing, found substitutes for tea, used homemade paper, and left their houses unpainted. The Sons of Liberty enforced the boycotts and, at times, violently forced violators to comply.

By 1770, the non-importation movement was losing momentum. Yet it had at least partially achieved its goal. By that year, the duties collected were less than £21,000, whereas the loss to British business from colonial boycotts amounted to nearly £700,000. British merchants and manufacturers, already affected by a depressed domestic economy, petitioned Parliament to rescind the duties. On March 5, 1770, the same day as the Boston Massacre, Parliament repealed the Townshend duties except for the three-pence tax on tea.

Trent, William

Born: February 13, 1715

Died: 1787

Colonial trader, land speculator, and soldier. William Trent was born on February 13, 1715, in Philadelphia, Pennsylvania. He was the son of a prominent merchant of the same name who was associated with William Penn in founding the colony of Pennsylvania. Trent played a prominent part in the westward movement into the

Ohio Country. He was also a trading partner of George Croghan, the leading British trader in the region.

In 1746, during King George's War (1744–1748), Trent served as captain of one of four companies raised in Pennsylvania for an intended expedition against Canada that never materialized. He established his partnership with Croghan in 1750. Two years later, Trent became a commissioner to Logstown, the Miami settlement and important British trading post approximately 10 to 15 miles down the Ohio River from present-day Pittsburgh near Economy, Pennsylvania.

In 1753, Lt. Gov. Robert Dinwiddie of Virginia directed Trent to build a fort at the Forks of the Ohio. Construction of the fort, named Fort Prince George, began on February 17, 1754. Less than two months later, on April 16, the fort was surrendered to the French, who expanded it and renamed it Fort Duquesne.

Trent was a captain in the service of both Pennsylvania and Virginia during the French and Indian War (1754–1763). Most notably, he attended the Indian council at Easton in 1757 and served as a guide for Brigadier General John Forbes's 1758 expedition against Fort Duquesne.

In 1760, Trent partnered with the London firm of Joseph Simon, David Franks, and Levi Andrew Levy to develop a large and prosperous Native American trading network. Trent took charge of the trading house of this new partnership at Fort Pitt. On the outbreak of Pontiac's Rebellion, he served as captain of the "militia" of traders organized to assist the regulars defending Fort Pitt during the 1763 native siege of that place. Trent's journal, kept from May 14 to September 19, 1763, along with his military orderly book, dated May 28 to October 16, 1763, present the most detailed contemporary account of the siege.

Following the French and Indian War and Pontiac's Rebellion, Trent became a leader of the so-called Suffering Traders, men who perennially requested from the Crown restitution for heavy trading losses in consequence of the Proclamation of 1763. Trent secured a large land grant on the Ohio River from the Iroquois but was never able to establish British legal recognition of his claim. Trent also served as an attorney for the Indiana Company and the Grand Ohio Company. He tried without success to establish a new colony, to be named Vandalia. Trent died sometime in 1787, probably in Philadelphia, Pennsylvania.

Triangular Trade

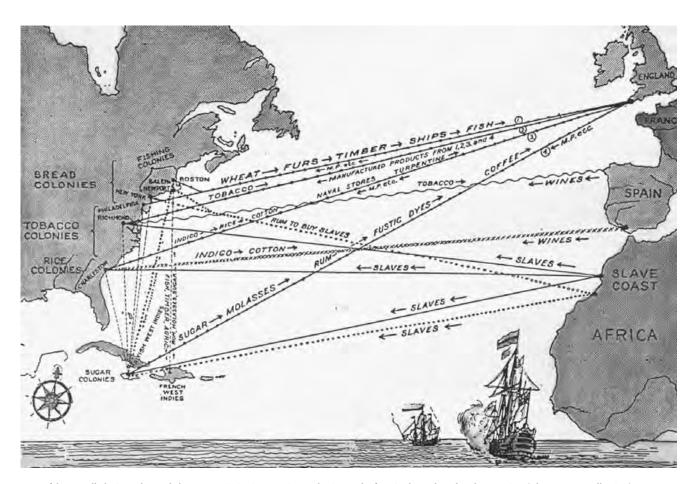

The Atlantic trade routes between Europe, Africa, and the Americas lasting from the 15th to the 19th centuries and involving the sale and transportation of African slaves, raw materials, and manufactured products. The triangular trade, which was largely a private endeavor, was first initiated by the Dutch and the Portuguese in the 15th century. The French and the British perfected the system beginning in the late 17th century.

Historically, the first stage of triangular trade occurred between Europe and Africa. In these transactions, European-manufactured goods were exchanged for African slaves. The colonists' increasing need for cheap labor to grow cash crops (such as tobacco and sugar) for European markets led to the trade in African slaves. The second stage consisted of transporting captured Africans from West Africa to the Americas. There slave traders exchanged slaves for cash or raw materials such as sugar or tobacco, timber products, and iron. The final leg of the triangle involved ship captains purchasing additional goods to take back to Europe based on the profits from the sale of slaves.

The development of colonial America highlighted the maturation of triangular trade routes. Vessels from the American colonies would set sail for Africa on the initial leg of the triangle, carrying kegs of rum and other goods produced locally. On the west coast of Africa, the products were exchanged for slaves and gold. From Africa, the second leg of the voyage commenced. This involved the infamous "middle passage" in which slaves were chained and confined to filthy and overcrowded quarters. This trip carried its human cargo to the West Indies, where Europeans exchanged slaves for molasses, sugar, or money. Many of the slaves were then sold to plantation owners in the southern colonies. The final leg brought the ships home to the colonies. They arrived filled with sugar or molasses, for making more rum, and a balance of gold and silver.

By the end of the 17th century, another busy trade route directly connected the colonies with the islands in the Caribbean Sea. Ships from the New England and mid-Atlantic colonies sailed southward with products such as grain, fish, meat, cloth, soap, lumber, shingles, and casks for molasses and sugar. On the return voyage, the ships carried sugar, molasses, and money.

Early industries such as shipbuilding and weapons manufacture grew as a result of the triangular trade. Although many individuals did profit from the transAtlantic slave trade into the 19th century, there were aspects of the economy not directly related to slavery that can also be attributed to the triangle route. Indeed, the return of profits to England provided the needed capital for the

Map of the so-called triangular trade between Britain, its American colonies, and Africa in the 17th and 18th centuries. (The Granger Collection)

Chief Exports of the British North American Colonies

Colony	Exports
Connecticut	Fish, horses, timber, sugar
Delaware	Grain, fruit, cattle, timber
Georgia	Rice, indigo
Maryland	Tobacco, wheat, flour
Massachusetts	Fish, horses, timber, sugar
New Hampshire	Mast and ship timber, naval stores, fish, horses,
-	timber, sugar
New Jersey	Wheat, flour
New York	Fur, timber, grain, livestock
North Carolina	Tobacco, mast and ship timber, naval stores
Pennsylvania	Wheat, flour
Rhode Island	Fish, horses, timber, sugar
South Carolina	Rice, indigo
Virginia	Tobacco

Industrial Revolution, which began in England in the late 1770s. In time, it eventually spread to the United States. In the 19th century, pressure to outlaw the transport of slaves from Africa all but ended the triangular trade.

Trois-Rivières

French fort and trading site. Trois-Rivières (meaning "three rivers") is located on the west shore of the St. Maurice River at its confluence with the St. Lawrence River, about halfway between Quebec and Montreal. Samuel de Champlain founded the settlement there in 1634. Trois-Rivières was the second French settlement in Canada and one of the oldest European settlements in North America.

Named after the three-armed delta formed by the islands at the St. Maurice River's mouth, Trois-Rivières was chosen for its strategic location as a military and fur-trading site. It was built on the site of an Algonquin stockade that had been abandoned some 30 years earlier because of Iroquois incursions. Once it was established, a number of Algonquins returned to live near or within the village, and many more natives visited the site to trade with the French.

From 1636, Trois-Rivières was under almost constant Iroquois attack, creating serious problems for the French who were unable to venture far from the fort. In July 1645, the French concluded a treaty there with the Mohawks, but efforts to secure peace with the other four Iroquois nations were not successful. Peace with the Mohawks did not last long, and they resumed their attacks in 1647. By 1649 the Iroquois had nearly halted the French fur trade and threatened French control of the St. Lawrence Valley.

Despite such setbacks, Trois-Rivières grew into a prosperous furtrading hub and place for converting the natives to Catholicism. Boasting a deep-water port, Trois-Rivières provided access to large merchant vessels and warships. Many Jesuit missionaries, including female Ursulines, chose to locate there, building, among other institutions, the St. Joseph Seminary in 1663 and the Ursuline Convent in 1697. During the wars between the French and the English in North America, Trois-Rivières also served on several occasions as an assembly point for French and native warriors raiding southward.

The French never heavily populated Trois-Rivières, however, and there were only 800 people in residence there at the time of the British conquest of New France in the French and Indian War (1754–1763). Thereafter, Trois-Rivières remained an important strategic and economic location. During the American Revolutionary War, on June 8, 1776, British forces turned back a Patriot attack there.

Trois-Rivières, Treaty of

Event Date: July 1645

Temporary peace agreement between the Mohawk Nation and New France reached in July 1645 at Trois-Rivières in New France (Canada). The Treaty of Trois-Rivières was the last serious attempt by one of the Iroquois Five Nations to secure peace with the French and the Hurons in the earliest stages of the Beaver Wars, which lasted until 1701.

Almost from the founding of the Iroquois Confederation, the Iroquois sought to convince the Hurons, who were linguistically and culturally related to them, to join the "Longhouse." The 1645 effort at Trois-Rivères, however, was not an attempt by the Iroquois as a whole to secure peace. Instead, it was undertaken solely by the easternmost of the Five Nations, the Mohawks, for their own benefit.

By the 1630s, the Iroquois had found that overtrapping had virtually wiped out the beaver in their own territory. Dependent on European trade goods, the Iroquois had to find another source of furs to maintain their relationship with their Dutch trading partners at Fort Orange (present-day Albany, New York). Huronia (which lay between Lake Huron's Georgian Bay and Lake Simcoe) had relatively few fur-bearing animals. Nevertheless, the Hurons took advantage of their geographical position, trading maize to other native peoples farther north and west in exchange for furs. The Hurons then transported the furs to the French in Quebec and traded them for manufactured items like pots, hatchets, knives, and cloth. In 1642, however, the French established the post of Montreal, which by virtue of its location interfered with Mohawk trade and their raids on Huron fur-trading parties on the St. Lawrence River.

The principal Mohawk diplomat, Kiotseaeton, went to Trois-Rivières with two goals in mind. The first was to secure a trade agreement with the French that would allow the Mohawks to trap on lands north of the St. Lawrence. The second was to secure access to Huron trade routes. Written into the treaty was a "secret clause" in which the French agreed not to extend protection to Algonquins who had not converted to Christianity. Supposedly, this clause was inserted in an attempt to secure Mohawk and Huron goodwill.

The Treaty of Trois-Rivières is interesting from an ethnohistorical standpoint in that French Jesuits who witnessed the meeting were able to record the proceedings in detail. Kiotseaeton began by standing in the bow of a shallop (open boat), draped in wampum, greeting the French, the Hurons, and the Algonquins with words of peace. Using belts and strings of wampum as mnemonic devices, Kiotseaeton acted out the history of Huron and Iroquois relations and his voyage to Trois-Rivières. He also brought two French prisoners, who he then ceremoniously handed over to Gov. Charles Huault Montmagny of New France.

The Treaty of Trois-Rivières remained in effect for only a little more than one year. Although the French encouraged the Mohawks to convince other Iroquois Confederation members to seek peace with New France, their efforts came to naught. The Senencas and the Onandagas, for instance, persisted with their raids against French interests. In the fall of 1646, Mohawk warriors killed the French Jesuit missionary Isaac Jogues, and by 1649 the Beaver Wars were in full swing. The treaty had done nothing to stem long-term tensions.

Troupes de la Marine

Colonial regular troops in New France. The troupes de la marine descended from a detachment of 150 French marines sent to Canada in 1683 by King Louis XIV to defend the colony against the Iroquois. The troupes were Canadianized over the succeeding decades, becoming largely colonial in leadership and rank and file. The troupes de la colonie, as they were known in Canada, became the focus of a kind of proto-nationalism similar to that which existed in the English colonies to the south. As with their Anglo-American counterparts, the troupes de la marine did not get on well with regular army troops (troupes de terre), soldiers dispatched to the colony from the mother country during the French and Indian War (1754–1763). They are not to be confused with the *milice*, or militia, composed of able-bodied male settlers in each of the parishes of New France.

In 1690, the troupes de la marine of Canada became the largest single contingent of a French marine corps placed on a permanent footing by royal ordinance. Prior to that, small units of troops had been raised from time to time to guard ships in port or merchant vessels at sea during wartime. The "free" or "independent" company structure of these units was continually maintained—they were never amalgamated into regiments—but their number sharply increased. This reflected the heightened interest of Louis XIV and his officials in defense of the French Empire. At any given time from 1690 to 1760, an average of 28 companies of marines was on duty in French Canada. Each consisted of 100 enlisted men under the command of a naval officer with a captain's commission in the infantry. He was assisted by two ensigns and two cadet officers learning their trade.

Another 21 companies of marines were stationed in Louisiana. However, they were seldom at full strength because of disease and desertion. In even worse straits were the marine troops, sent to serve in the French Caribbean islands, primarily to guard against slave uprisings. Malaria and the oppressive heat made service there a virtual sentence of death for enlisted men. And officers earned a "danger money" supplement of 4,000 *livres*.

From 1683 to 1690, the French government sent some 10,000 soldiers and officers of the troupes de la marine from France to Canada. Most remained there once their time of service was up. This led to a rapid Canadianization of the marine officer corps. Already by 1690, one-third was Canadian-born. That figure had reached one-half by 1720 and three-quarters by 1750. By the mid-1700s, according to historian William J. Eccles, the officer corps of the troupes de la marine in Canada "had become a virtual caste, commissions being reserved for the sons of Canadian serving officers." Some of these officers took advantage of royal grants of land to transform themselves into rural magnates in Quebec. Others became wealthy by combining their military duties on the frontier with a sideline in fur trading. By the early 1700s, the officers of Canada's troupes de la marine had come to resemble no one more than the landed gentry

of the English enemy. Their sometimes avid materialism does not seem to have dulled their military ardor, however.

As the front line of colonial defense, the troupes de la marine manned forts across New France, from Louisbourg on Cape Breton Island to New Orleans near the mouth of the Mississippi River in the southwest, by way of the Great Lakes and the Ohio River Valley. The marines also played a major role, alongside the Canadian militia and the colony's Native American allies, in carrying the war to the enemy from King William's War (1689–1697) until the conclusion of the French and Indian War in 1763.

Skilled in wilderness warfare and flexible in their relations with native allies because of long service on the far-flung frontiers of New France, the troupes were able to hold their own in the 17th- and early-18th-century colonial wars, despite inferior numbers. By the time of the French and Indian War (1754–1763), however, the weight of numbers had begun to be felt. Already by 1750, the population of the 13 English colonies had reached about one million, compared to about 70,000 people of European descent in New France. When war came in 1754, it would be necessary to bring in troupes de terre from France to assist in the defense of the colony. The troupes de la marine were, nonetheless, present at all of the major engagements of the conflict, in spite of the ill-concealed contempt for their martial prowess on the part of regular officers, most conspicuously the commander in chief of French forces, Major General Louis-Joseph, Marquis de Montcalm.

Although they probably made their greatest contribution in irregular warfare, particularly raids on Anglo-American settlements and ambushes of British supply trains, the troupes de la marine did not eschew pitched battle. This was most clear in their participation in the defeat of Major General Edward Braddock's force near Fort Duquesne in 1755.

Following the defeat of France in Canada in 1760, of the 300 officers, 76 sergeants, and 3,168 enlisted men in the French forces who chose repatriation to France under the Articles of Capitulation, 107 of the officers and 1,052 of the enlisted men were members of the troupes de la marine. They left despite their deep cultural and economic roots in the former French colony.

Tryon, William

Born: June 8, 1729 Died: January 27, 1788

British Royal governor of North Carolina (1765–1771) and New York (1771–1780) who won the War of the Regulation (1768–1771). William Tryon was born on June 8, 1729, in Surrey, England. After receiving a private education, in 1751 he purchased a lieutenant's commission in the elite regiment of Foot Guards. Over the next seven years Tryon rose rapidly in rank to lieutenant colonel. In 1767, he married a relative of Lord Hillsborough, a prominent British politician.

Tryon served in Europe during the Seven Years' War (1756–1763) but feared that the return of peace would end his hopes of further army advancement. He therefore sought new opportunities in colonial administration. Through Hillsborough's influence, in June 1764 Tryon secured appointment as lieutenant governor of North Carolina.

Tryon became governor of North Carolina the following year, 1765, on the death of his predecessor, Arthur Dobbs. At New Bern Tryon constructed a spectacular new capitol building and governor's residence, called Tryon Palace. In 1768, high taxes and the corruption of local officials led to protests among the settlers in western North Carolina, who formed the Regulator Association. Although Tryon sympathized with the Regulators' grievances, he refused to tolerate their disruption of the courts and violent attacks on officials. In January 1771, the provincial assembly pronounced the Regulators guilty of treason. When they began assembling in the spring, Tryon personally led a force of militia to disperse them.

Tryon marched to Alamance Creek with 1,300 militiamen, where he confronted about 2,000 Regulators. After a two-day standoff, Tryon attacked and dispersed the Regulators. The defeat of the Regulators and the subsequent execution of seven of their leaders effectively ended the movement. His heavy-handed approach also made Tryon unpopular with many rural North Carolinians.

Tryon became governor of New York in July 1771. After the outbreak of the American Revolutionary War, he recruited several Loyalist battalions there. The British government appointed him major general of provincial troops in 1777, and Tryon then led several raids against American ports. Tryon returned to England in 1780, and died in London on January 27, 1788.

Tunicas

Native American people inhabiting the Louisiana region along the Mississippi River. The first historical reference to the Tunica tribe may have been in the chronicles of Hernando de Soto. It was in these that they were identified as the "Tanico." On European contact, the Tunicas were reportedly living along the Yazoo River in northwestern Mississippi. There they produced and traded salt. The French found them in the same general area in the late 17th century, and the Tunicas and the French soon became firm allies.

The Tunicas were noteworthy for their support of the French against the Natchez. This hostility apparently stemmed from a longstanding feud of unknown origin. During the Natchez War (1729–1733), the Natchez, knowing that the Tunicas were allied with the French, attacked them in April 1731 and killed the principal Tunica chief. The Tunicas reported many other casualties as well. In 1736, the Tunicas turned against the Chickasaws during the Chickasaw Wars (1736, 1739–1740) because the Chickasaws were allied with the English. The French long considered the Tunicas as vital to the defense of the lower Mississippi Valley.

The Tunicas also served important commercial roles. Indeed, they became key middlemen between European traders and other Native American tribes, handling both European and native-made goods. The Tunicas were also pivotal in the trading of horses from eastern Texas to Louisiana.

The Tunicas remained staunch allies of the French until they were forced from the region in 1763. From that time, the dwindling number of Tunicas assimilated with other tribes. By 1783, the Tunica population was down to only 80 people. The United States government finally recognized the Tunica-Biloxi tribe in 1989.

Tuscaroras

Iroquoian-speaking Native Americans whose territory included most of eastern North Carolina during the colonial period. The Tuscaroras were a loose confederacy of three tribes with an estimated population of around 25,000 people prior to European contact. The Tuscarora Nation was the most powerful in a vast region of the Southeast running from Virginia in the north to South Carolina in

Tuscarora Native Americans prepare to take captive surveyors John Lawson and Baron Christoph von Graffenried in North Carolina in 1711. (North Wind Picture Archives)

the south. The Tuscaroras were also the sixth nation to join the Iroquois Confederation in 1722.

The Tuscaroras were farmers, hunters, gatherers, and saltwater fishers along the lower Neuse, Tar, Pamlico, and Roanoke rivers. Many Tuscarora townships built oblong and oval houses, each serving several families. The longhouse was more typical in the Tuscarora-Iroquoian tradition. Structural frames of pine, cedar, and hickory were secured with bark and moss to form the shell of the longhouses. Cedar and cypress bark covered quadrangular arched roofs, which had smoke holes in the centers. Animal skins covered mats of reed sprawled over bed benches skirting the inner structure. Windowless granary structures and houses encircled the villages' council meeting area. Many times situated on slopes along waterways, some strategic villages were heavily fortified and palisaded.

Weapons and dress were tied to regional tribes and climate, but Tuscarora adornment was elaborate. Tattooing displayed tribal symbols, usually on the right shoulder. Regalia included pendants of bone and teeth, wampum ear pendants, necklaces, and beads of bone, copper, and colored stones. Chieftain adornments included pearls.

By 1650, the Tuscaroras were fully involved in the fur trade and slave trade with Europeans. Their primary town of Kentenuaka came to be regarded as a center for Native American trade and commerce by 1670. Described in 1701 as the largest tribe in the region, their population was greatly diminished by 1707. Both disease and slave traders helped decimate the population.

Their relationship with the English deteriorated in the early 18th century. In 1710, Baron Christoph von Graffenried founded the

German and Swiss colony of New Bern, North Carolina. Not content to stay there, he continued surveying along the Trent River and the Neuse River, the heart of Tuscarora country. Graffenried's bold encroachments, combined with abuses on the part of colonial traders in South Carolina, North Carolina, and Virginia, forced the Tuscaroras to war in 1711.

In what became known as the Tuscarora War (1711–1713), the Tuscaroras raided white settlements, killing some 200 Europeans. The war had two phases. The first was a conflict between the Tuscaroras and English settlers, and the second witnessed the Tuscaroras fighting Europeans and rival tribes, including their northern Tuscarora kindred the Creeks and the Yamasees.

The war ended in March 1713 with a Tuscarora capitulation. After that, in 1715, some Tuscaroras were forced onto a small North Carolina reservation. Some 2,000 others fled northward to live among tribes of the Iroquois Confederation. The Tuscaroras were officially recognized as the confederation's sixth nation in 1722. The Tuscaroras tried to remain neutral during the course of the American Revolutionary War. Still they were poorly treated. New York confiscated land there that they shared with the Oneidas and forcibly removed them to the Seneca reservation, near present-day Lewiston, New York. There they eventually purchased land in 1796 and in 1804.

Tuscarora War

Start Date: September 22, 1711 End Date: April 14, 1713

Major war between Native Americans and colonists in North Carolina. The Tuscarora War began on September 22, 1711, when Tuscarora and Algonquin militants attacked colonial settlements on the Neuse River and the Pamlico River. The uprising, proprietary North Carolina's largest and costliest native war, was the result of the colonists' fraudulent trading practices, land seizures, and forced native enslavement. When peace returned in 1713, political, religious, and economic reforms fueled North Carolina's growth. The defeat of the Tuscaroras also removed the last obstacle blocking European expansion in the colony.

The Iroquois-speaking Tuscaroras, the largest tribe in North Carolina's central coastal plain, occupied several towns along the Pamlico, Neuse, and Trent rivers. Resentment toward Europeans began when Baron Christoph von Graffenried occupied a vacated Tuscarora town. Other colonists followed suit, establishing communities on or abutting tribal lands. Although colonial expansion increased trade between natives and Europeans, mistreatment, cultural prejudice, and fraud engendered hard feelings. The prohibition of hunting in newly settled areas also enraged the Tuscaroras.

The enslavement of children, however, produced the greatest outcry. Although the colony's lord proprietors forbade the practice, native slavery flourished throughout the Carolinas. The Tuscaroras discovered, however, that their children, entrusted to neighboring colonists for apprenticeships, were often enslaved.

By 1710, the Tuscaroras sought to escape the abuses and encroachments by moving north. Pennsylvania's leaders, however, rejected the tribal diplomats' petition to relocate. Hancock, chief of the southern Tuscaroras, responded with force.

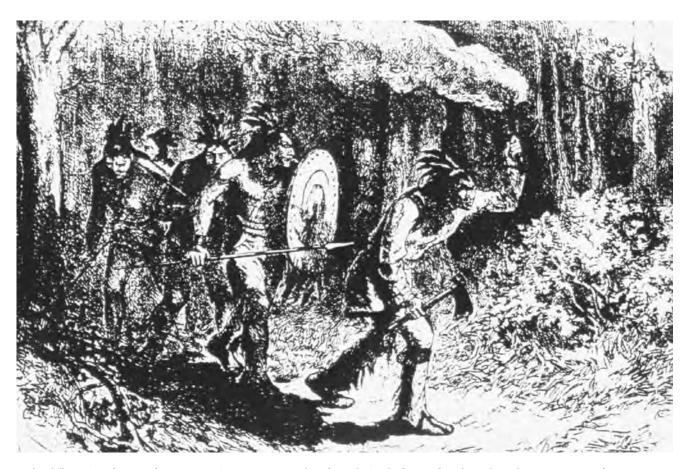

On September 22, 1711, some 250 Bear River, Pamlico, Neusiok, Coree, Machapunga, and Tuscarora warriors visited unsuspecting homes. Once welcomed into the colonists' abodes, the natives brandished weapons and killed the inhabitants. Nearly 130 men, women, and children perished during the attacks. Many others, including Baron von Graffenried, were captured. News of the onslaught shocked colonial leaders. Political instability, civil unrest, disease, and drought initially prevented Gov. Edward Hyde from organizing a military response or providing relief to those in need.

Thomas Pollock, president of the provincial council, immediately marched militia to the war zone. Problems resulted, however, when soldiers from Bath Town refused to cross the Pamlico River to join troops from New Bern. As a result, New Bern's forces were stranded without reinforcements in hostile territory.

Governor Hyde, meanwhile, appealed to neighboring colonies for assistance. Lt. Gov. Alexander Spotswood of Virginia responded by securing the neutrality of several tribes with promises of trade, bounties for enemies, recognition of tribal boundaries, and protection. He also dispatched Peter Poythres, a veteran scout and interpreter, to neutral Tuscarora settlements. His diplomacy produced treaties with the eight upper towns, thereby halving the Tuscaroras' fighting power and diminishing the hostiles' chance of victory. Spotswood also secured the safe release of Baron von Graffenried and other prisoners, while ratifying treaties with the Nottoways, the Saponis, and the Meherrins, thereby further isolating the militant Tuscaroras.

In 1712 Spotswood sent blankets and clothing to help ease the plight of war refugees. He also readied Virginia's militia, bolstered by 100 native allies, to march against the hostiles. Plans for the expedition fell through, however, when North Carolina's leaders failed to provision Spotswood's army.

South Carolina officials responded to Hyde's pleas by recruiting Catawba and Yamasee warriors to march against their traditional enemies. Many volunteers saw the campaign as an

Undated illustration of a party of Tuscarora Native Americans searching for settlers in the forests of North Carolina. The Tuscarora War of 1711–1713 was a punitive campaign against the Tuscaroras, who had attacked settlers for taking their land. (Hulton Getty/Archive Photos)

opportunity to secure native slaves, a line of reasoning encouraged by Governor Hyde.

Colonel John Barnwell, a South Carolina trader and experienced soldier, commanded an army of 495 natives and 30 colonists. On reaching New Bern in February 1712, Barnwell's force encountered fierce resistance. A short time later the colonel learned that two-thirds of his force had deserted, taking a large supply of slaves and goods with them. Sixty-seven locals bolstered what remained of Barnwell's force in a campaign against Fort Hancock, a fortified Tuscarora town along the Neuse River. Although Barnwell's first assault was unsuccessful, his use of cannon ultimately produced a negotiated settlement.

The truce did not last long. Shortly after negotiating the agreement, Barnwell enslaved those who had accepted his terms. Not surprisingly, the colonel's treachery sparked a series of Tuscarora raids during the summer of 1712, a situation exacerbated by food shortages, Quaker politicians' refusal to support the war, and Governor Hyde's death in September 1712.

Once again, South Carolinians responded with military force. In March 1713, Colonel James Moore Jr. led 50 colonists and 1,000 native allies against Nehucke, a Tuscarora town protected by pal-

isades, blockhouses, and escape tunnels. Moore achieved victory only after setting fire to the town's palisades. He later estimated that 558 natives had perished in the fight. Nearly 400 others were captured. Following the victory all but 180 of Moore's soldiers deserted him, taking their slaves and plunder with them back to South Carolina.

Moore's campaign signaled the end of the Tuscarora War. By 1713 both the natives and North Carolina officials lacked the resources needed to prolong the conflict. News of Nehucke's destruction also prompted residents of other lower Tuscarora settlements to escape a similar fate by fleeing west to the headwaters of the Roanoke River.

On April 14, 1713, Thomas Pollock concluded a peace with the remaining Tuscaroras. Tom Blunt, declared "king" of all Tuscaroras, accepted a reservation established for the tribe between the Neuse River and the Pamlico River. Although the treaty did not end hostilities, it marked the end of Tuscarora dominance.

Peaceful Tuscaroras, now the targets of frequent enemy raids, depended on their colonial neighbors for supplies and protection. North Carolina officials approved relocation to a new reservation along the Roanoke River following Catawba attacks during the

788 Tuscarora War

1720s. Later removals to New York to join the Iroquois Confederacy, which had adopted the Tuscaroras around 1722, finally brought the promise of revitalization to a defeated people.

U

Uncas

Born: ca. 1588 Died: 1683

Leader of the Mohegans. Most Americans think of Uncas as the fictional character in James Fenimore Cooper's *The Last of the Mohicans*. The historical Uncas, however, was a Mohegan, not a Mahican (Mohican), and not the last of his tribe. Uncas closely allied himself with the New England colonies and presided over the rise of the Mohegans. Perhaps born in 1588, Uncas gave military assistance to the colonies at Plymouth, Connecticut, and Massachusetts Bay during the Pequot War (1636–1638) and King Philip's War (1675–1676). These alliances, along with his part in the slaying of the Narragansett sachem (chief) Miantonomo, have caused some historians to cast Uncas as a traitor to native peoples. However, his actions also strengthened the Mohegans and helped them retain a measure of independence in colonial New England.

A small tributary group dominated by the more powerful Pequots, the Mohegans occupied the lands between the Connecticut River and the Thames River. When the Pequot War erupted in 1636, Uncas participated in planning and leading the attack on the Pequots' Mystic River fort. As a reward for his services, he was given a large share of Pequot prisoners, most of whom were incorporated into the Mohegan tribe.

Uncas proved useful yet again when Miantonomo, an English ally during the Pequot War, began to speak out against them. At the same time, Uncas's Mohegans began attacking Narragansett hunters. Following a treaty he had signed with Massachusetts, Miantonomo sought and was granted permission to attack the Mohegans. The Mohegans captured Miantonomo, and Uncas

turned him over to the colony of Connecticut. Not wanting Miantonomo's blood on their own hands, Connecticut authorities gave Miantonomo back to Uncas, who had him executed.

During King Philip's War in 1675–1676, Uncas allied the Mohegans to Massachusetts Bay and assisted them in crushing the rebellion. After the war, Uncas reaffirmed his alliance to the colony. Uncas died in 1683.

Underhill, John

Born: 1597

Died: July 21, 1672

English-born mercenary, privateer, and militia officer. John Underhill was born sometime in 1597 at Bagington, Warwickshire, England. He gained his first military experience in the Netherlands, where he also married a Dutch woman. He arrived in Massachusetts in 1630 to train the colonial militia. He also served as a Boston town official.

Underhill served as a captain in command of a Massachusetts militia contingent during the Pequot War (1636–1638). In May

1637, Underhill's force participated in the massacre of the inhabitants of a Pequot village on the Mystic River in Connecticut. The village contained between 400 and 700 people, mostly women, children, and elderly men. The New Englanders set the village afire and killed anyone trying to escape the flames. Underhill later wrote an account of the Pequot War entitled *News from America*.

A 1639 accusation of heresy led to Underhill's banishment from Massachusetts Bay Colony. He subsequently moved to New Hampshire, then Connecticut, and finally in 1643 to New Netherland. There he lived among other English settlers on Long Island. Gov. Willem Kieft hired Underhill to command militia during the early phase of the Dutch-Indian Wars (1641–1664). Underhill's unit participated in another massacre of a native village in February 1644. This time, his men burned and shot a reported 500–700 inhabitants of an Algonquin village near present-day Westchester, New York. Toward the end of the war, however, Kieft abruptly dismissed Underhill.

Continuing to live in New Netherland, Underhill served as the sheriff of Flushing, Long Island, and defended English interests there. Following the outbreak of the First Anglo-Dutch War (1652–1654), Connecticut officials wrote to him in 1653 and asked him to investigate a possible Dutch conspiracy to arm natives against the English. Dutch officials then arrested Underhill when he publicly accused them of inciting the natives against the English. On his release, Underhill openly worked against Dutch rule on Long Island, calling on English residents there to overthrow the Dutch. When the English failed to heed his calls, he fled to Rhode Island. There he accepted a privateer's commission to raid Dutch shipping and was called on to organize an English force to attack New Netherland.

When the English took over New Netherland in 1664, Underhill again moved to Long Island. There he held a number of official posts. Underhill died on July 21, 1672, in an area then known as Killingworth on Long Island.

Uprising of 1747

Start Date: Spring 1747 End Date: September 1747

Revolt of Ohio Country Native Americans against the French during King George's War (1744–1748). The Uprising of 1747 reflected the volatile interplay of tribal rivalries and imperial ambitions on the North American continent. By the early–1740s, the area south of Lake Erie had become an arena for commercial competition between New France and rapidly encroaching English traders from Pennsylvania. In this borderland between colonial empires, gaining the allegiance of a recently relocated tribe of Hurons, known as the Wyandots, was a key factor in regional politics.

Huron/Wyandot chief Orontony had requested resettlement deep within French territory to protect the Wyandots from predations by the Ottawas, located near Detroit. His collaboration with the Cherokees in an earlier assault on an Ottawa war party had ruined his standing within the Great Lakes region, however. Rejected by French colonial overseers whom he likened to slave owners and hostile toward their Algonquian-dominated confederation, he moved his people instead to the periphery of French power. The Wyandots finally settled at Sandusky Bay. Ambitious and prone to conspiracy, Orontony immediately cultivated relations with the English by traveling to Albany and obtaining trading privileges.

This new partnership brought Orontony into contact with the most successful and charismatic merchant in the region, George Croghan. It also earned him the enmity of the French. An Irish immigrant well versed in native languages and customs, Croghan was developing a vast economic network. By 1746, he had secured permission to build a blockhouse at the Wyandot village of Sandusky, located between Detroit and the Cuyahoga River in what was the first British military emplacement in the Ohio Country. Already apprehensive over losing influence with the powerful Iroquois Confederation as a bulwark against the British, French authorities placed a bounty on Croghan's head. Quick to joke about his newfound notoriety, Croghan remained undeterred. Meanwhile, Orontony agitated among the Miami (Twightwee), Ottawa, and Shawnee tribes to stage assaults on overextended French positions with an emphasis on taking Detroit. His plan was to establish himself as a figure worthy of leading a new nation, independent of French authority.

The onset of King George's War in 1744 created an opportunity for Orontony to strike at the French and gain leverage by requesting British support. The threat of a British invasion of Quebec received the highest priority in French preparedness, which left the Ohio Country sparsely defended. In the spring of 1747, five French traders who were unaware of Orontony's machinations were murdered while visiting Sandusky. Then, a French fort on the Maumee River was partially burned and the Miamis razed a trading post within their territory.

The Uprising of 1747 had begun. Orontony arrived at Detroit purportedly to seek peace, but a party of natives killed several Frenchmen nearby. Natives, including the Ottawas, planned a massive attack against the settlement, but the work of an informant scuttled the operation.

Although not always in coordination with one another, numerous native villages rose against the French as the entire frontier became destabilized. Croghan's precise role in encouraging Orontony remains unclear, but the trader likely promised British assistance to him and provided gunpowder to the native rebels. Sensitive to his own credibility, Croghan convinced the governor of Pennsylvania to provide logistical support lest the rebelling tribes reassess their loyalties. The French proved quick to identify British intrigue as the primary cause of the uprising, but the true explanation was more complex. Indeed, the ongoing success of the British Navy in denying supplies to Canada had rendered French trade with the natives far less appealing. That forced many tribes to turn against the French and ally with the British.

In September 1747, the deployment of French reinforcements compelled Orontony to destroy Sandusky and retreat eastward into the Ohio River Valley and then Pennsylvania, where he died in 1750. The Wyandots ceased hostilities, but the Miamis continued fighting until 1752. Only the hiring of French allies from distant locations brought the insurgency to a close. Although ultimately successful in quelling the revolt, the French suffered heavy losses at their commercial outposts and were fortunate to retain Detroit.

Slowly, during the early 1750s, the French improved their standing with the tribes of the Great lakes. The Uprising of 1747 factored into an attempt by natives to renegotiate within a rapidly deteriorating French alliance system. One measure of mounting desperation among the French was the abrogation of the policy of pardoning warriors who had fought against them. Clearly, France's native allies were growing more cognizant of the shifting balance of power in favor of the British.

Utrecht, Treaty of Event Date: April 11, 1713

Diplomatic settlement that ended the War of the Spanish Succession in Europe (1702–1713, Queen Anne's War in North America).

The Congress of Utrecht in the Netherlands resulted in the Treaty of Utrecht in 1713, ending the War of the Spanish Succession (1702–1713). Wood engraving, English, 19th century. (The Granger Collection)

The Treaty of Utrecht was actually one in a series of agreements signed at Utrecht in the Netherlands between January and July 1713. The principal agreement involving France and Britain marked a significant turning point in both European history and in the struggle for dominance in North America.

Negotiations between the combatants began in early 1712 at Utrecht. These talks culminated in the signing of the principal peace treaty on April 11, 1713. The Utrecht settlement ended what has sometimes been referred to as "the first world war" and dealt with a wide number of territorial and dynastic issues around the world.

The issue touching off the war had been which major dynastic family power would inherit the throne of Spain and its considerable holdings in Europe and America. Both King Louis XIV of France and Holy Roman Emperor Leopold I had sought to place a member of their family on the Spanish throne and keep the Spanish inheritance intact. The terms of the treaty ended that. Spain lost its European possessions but retained the territory it held in America. Louis XIV's grandson was confirmed as king of Spain but with the provision that the two kingdoms of France and Spain never be united under one ruler. The Austrian Habsburgs were indemnified for the loss of their claims on the Spanish throne by receiving the substantial Spanish

holdings in Europe, apart from Iberia. These included Naples, Milan, Sardinia, and the Spanish Netherlands (which were then known as the Austrian Netherlands and are today Belgium and Luxembourg).

The Dutch received guarantees of their territorial integrity and recovered the border fortresses. The Scheldt River was to be open only to Dutch ships, meaning the ruin of the port of Antwerp in the Austrian Netherlands. Both Brandenburg and Savoy were rewarded for their contributions for the allied cause. The elector of Brandenburg was confirmed in the title of king of Prussia, an important step forward in the rise of the House of Hohenzollern. The ruler of Savoy also received the title of king and received the former Spanish island of Sicily, which it exchanged in 1720 with Austria for Sardinia, becoming the kingdom of Sardinia. Sardinia would be the driving force behind the future unification of Italy, and the kingdom of Prussia would play the same role among the German states.

Great Britain was the biggest winner at Utrecht, however. The union of England and Scotland had occurred during the war. The French king recognized the legitimacy of Britain's Protestant succession and agreed to end all support for the Stuart pretenders to the English throne. Britain also acquired important territories in Europe and North America. In Europe, the British retained Gibraltar and Minorca, both important to British naval dominance in the Mediterranean. In North America, the British acquired Acadia (Nova Scotia), Newfoundland, Hudson Bay, and Saint Kitts (St. Christopher) in the Caribbean. Britain also secured a favorable tariff on goods sent into Spain through the port of Cadiz and the asiento (contract) allowing the British South Sea Company (formed in 1711) a monopoly on the annual importation of 4,800 African slaves into Spanish America for a period of 30 years. It also allowed Britain to send one trading ship a year to the Spanish colonies, an open license for British smuggling into Latin America.

The bulk of New France remained intact. On Cape Breton Island the French would soon begin construction of the fortress of Louisbourg. They also held Prince Edward Island and the entire Mississippi River Valley. In addition, France retained its colonies in the West Indies: Martinique, Guadeloupe, and western Hispaniola. In addition, the French retained claims to the islands of Dominica and St. Lucia.

Spanish America remained largely unchanged. Spain retained Florida and the large viceroyalties of New Spain (Mexico), New Granada (modern Colombia and Venezuela), and Peru (including present-day Argentina, Paraguay, and Uruguay).

The treaty satisfied Britain's major objectives of preventing the French domination of Europe. Much of the fighting in the war had been on French soil, and France had suffered greatly economically from the burden of fighting alone, save Spain, in virtually the whole of Europe. Britain had secured economic and territorial advantages and had substantially reduced French power in North America.

Britain's acquisition of Newfoundland, Acadia, and Hudson Bay enhanced significantly its merchant, fishing, and fur-trading industries. The new land acquisitions gave rise to the possibility of further expansion of British settlements in North America. Yet the British colonists in America were disappointed by the treaty's outcome. Ambiguous boundaries, questionable fishing rights, and Native American relations wore heavily on the English colonies. In America, the Treaty of Utrecht was only a long truce; the English colonies would again be at war with New France in 1744.

Venango (Pennsylvania)

Pennsylvania post and supply station located at the juncture of French Creek (Rivière au Boeuf) and the Allegheny River. Originally the site of a native village, Venango was the third in a chain of French posts (after Fort de la Presque Isle and Fort Le Boeuf) that connected Lake Erie with the Ohio Valley. Venango was some 50 miles from Fort Le Boeuf. Briton John Fraser operated a trading post at Venango from 1741. Beginning in 1749, French authorities ordered him to quit the area and, when he refused, in August 1753 Philippe-Thomas Chabert de Joncaire seized Fraser's house. Virginia militia major George Washington stopped at Venango on December 4–7, 1753, on his mission to warn the French to leave the Ohio Valley. While he was there, Joncaire and other French officers bluntly told Washington of the French intention to control all of the Ohio Country.

The French were slow to fortify Venango, but they did erect a fort there in 1755 during the French and Indian War and a larger one two years later. Resembling forts at Presque Isle and Le Boeuf, it was named Fort Machault in honor of Minister of Marine Jean-Baptiste de Machault d'Arnouville.

Following his destruction of and departure from Fort Duquesne in November 1758, Captain François Marie de Marchand de Lignery withdrew to Venango, where he assembled forces for a counterattack on Duquesne in 1759. On July 13, 1759, however, Lignery

learned of the British attack on Fort Niagara. His lines of communication threatened, he destroyed Fort Machault and marched with 1,200 troops and natives to Niagara, only to be ambushed and defeated near there by the British and allied natives on July 24.

During Pontiac's Rebellion, when British colonel Henry Bouquet moved his troops from Pittsburgh to Lake Erie, he built a blockhouse at Venango. In early June 1763, however, Seneca natives captured Venango and burned it, the British garrison there perishing to the last man.

Vernon, Edward

Born: November 12, 1684 Died: October 30, 1757

British Navy admiral. Born at Westminster, England, on November 12, 1684, the son of James Vernon, secretary of state to King

William III, Edward Vernon was educated at Westminster School. He joined the navy in 1700, and during the next dozen years he served in seven different ships. He won promotion to captain in 1706 during the War of the Spanish Succession (Queen Anne's War, 1702–1713). After 1712, Vernon saw extensive service in the Baltic.

Elected to Parliament in 1722, Vernon again served in the Baltic and at Gibraltar. In Parliament, Vernon was an outspoken proponent of war with Spain, boasting that he could take Spain's Caribbean base of Portobello with only half a dozen ships. When war began with Spain in 1739 in the War of Jenkins' Ear (1739–1744), Vernon received promotion to vice admiral and was given command of a squadron to fulfill his boast.

In November 1739, with only six ships of the line, Vernon attacked Portobello and captured it in a highly acclaimed victory. Vernon's subsequent operations against Cartagena, Santiago, and Panama all failed, largely because of the reluctance of the British ground commander, Major General Thomas Wentworth, and an outbreak of yellow fever.

Vernon returned to England in 1742, resuming his seat in Parliament, where he was critical of the administration of the Royal Navy. Promoted to full admiral in 1745, Vernon took command in the North Sea, but an investigation into a series of anonymous pamphlets he had published critical of the navy led to his retirement in April 1746. He continued to serve in Parliament until his death on October 30, 1757.

Although Vernon is best known for his victory at Portobello, he is also known for more esoteric reasons. In 1740, he concocted a diluted rum ration for his sailors to reduce drunkenness, and the special brew came to bear his nickname, "Grog," a name Vernon earned for his tendency to wear a grogram cloak. He also lent his name to a number of towns and buildings throughout England and the United States, including President George Washington's Mount Vernon estate.

Vetch, Samuel

Born: December 9, 1668 Died: April 30, 1732

English colonial politician, diplomat, merchant, military leader, and governor of Nova Scotia (1710–1713, 1715–1717). Samuel

Vetch was born in Edinburgh, Scotland, on December 9, 1668. While Vetch was still a child his family moved to the Netherlands, where he was educated and served as an officer in the Dutch Army. After extensive campaigning in Europe, Vetch attained the rank of captain and in 1698 joined an English expedition to Panama. Conflict with the Spaniards, however, led the English to abandon the colony. Vetch then traveled to Albany, New York, where he married Margaret Livingston of the influential Livingston family.

Vetch began trading with the local Native Americans, but in 1702 he moved to Boston. In 1705, he secured an appointment to a diplomatic mission in Quebec. Part of his assignment there was to obtain information about the town's defenses. While in Canada, his desire for wealth led him to begin the sale of arms to the French, despite the fact that France and England were at war (Queen Anne's War, 1702–1713). When Massachusetts authorities learned of his activity, they arrested Vetch. Tried and convicted of smuggling, Vetch went to England, where in 1708 he succeeded in convincing officials to overturn his conviction.

That same year Vetch began promoting his plan for a British invasion of Canada. British leaders approved his proposal and ordered him back to America in company with Colonel Francis Nicholson to organize the expedition. Vetch arrived in Boston in the spring of 1709 and began raising troops for a seaborne attack via the St. Lawrence River. The plan had to be abandoned when British reinforcements failed to arrive. Nevertheless, Vetch employed this force to attack and occupy French Acadia in September 1710. The British government renamed the territory Nova Scotia, and rewarded Vetch for his services by appointing him governor and military commander there. British control of Nova Scotia was affirmed when France officially ceded the territory in the 1713 Treaty of Utrecht.

Vetch, meanwhile, joined a British expedition assembling in Boston for another attack on Canada. The fleet sailed for Quebec in July 1711, with Vetch in command of the provincial forces. After a disaster the following month in which several ships struck rocks and sank in the St. Lawrence, drowning hundreds of British soldiers, Vetch nonetheless urged his superiors to press on to Quebec. However, they chose instead to return to Boston.

Returning to Nova Scotia, Vetch engaged in a lengthy dispute with Nicholson. That, along with Vetch's constant demands to be reimbursed for expenses he had incurred to support the British post at Annapolis Royal, caused British officials to remove him from his post in 1713. Nicholson succeeded him.

Vetch then returned to England to defend himself. He won reappointment as Nova Scotia's governor in 1715. He held the post for two more years, until replaced by Richard Philipps. In 1719 Vetch journeyed once again to England, but his efforts to secure reimbursement for his expenses were not successful. Destitute, Vetch was remanded to an unknown debtors' prison, where he died on April 30, 1732.

Villasur, Pedro de

Born: Unknown Died: August 14, 1720

The Spanish lieutenant governor of New Mexico (1719–1720). Little is known of Pedro de Villasur's early life. He arrived in New Mexico during the 1680s and was appointed lieutenant governor in 1719. Since early colonial times, Spain had steadfastly claimed the entire Great Plains region. Nonetheless, French traders, trappers, and explorers had been present in the region since the 17th century. When war broke out between Spain and France in 1719, the Spanish government decided it had to halt the extensive trading activities between the French and the natives. Rumors abounded that the French were supplying the natives with weapons.

Gov. Antonio de Valverde y Cosío of New Mexico ordered Villasur to lead an expeditionary force into the Great Plains to show the flag and to disrupt French activity there. Although Villasur was evidently an able administrator, he had little or no military experience.

Villasur set out from Santa Fe on June 16, 1720. His expeditionary force consisted of 40 Spanish soldiers, 60 Pueblo warriors, 10 Apache guides, a Catholic priest (Father Fray Juan Minguez), and a merchant. In August, the expeditionary force arrived at the Platte River in Nebraska, somewhere in the vicinity of Grand Island. The area was then heavily populated with Pawnee and Oto natives.

The desertion near present-day Schuyler, Nebraska, of one of his principal aides, Joseph Naranjo, greatly alarmed Villasur. Believing that Naranjo might be acting in collusion with the Pawnees, Villasur moved his force back to the Loop River, where on the evening of August 13 the men set up camp probably just south of present-day Columbus, Nebraska.

There, at dawn on August 14, a large force of Pawnee and Oto natives, then allied with the French, attacked the Spanish expeditionary force. Most of the soldiers were still asleep. Within minutes, Villasur, the priest, the merchant, most of the Spanish soldiers, and some of the native warriors and guides lay dead.

Seven of the Spanish soldiers managed to escape on horseback. The Pueblo natives were in a separate camp and did not bear the brunt of the initial Pawnee attack. They too were soon heavily engaged, and 11 of them died.

The survivors withdrew to Santa Fe, arriving there on September 6. Many blamed French fur traders, active among the Pawnees, for the defeat. In any case, this event signaled the end of Spanish power in the Great Plains and left the French in undisputed control of the Missouri River Valley region.

Vincennes (Indiana)

Trading outpost formally established in 1732 by the French roughly 150 miles north of the confluence of the Wabash River and Ohio River (the southwestern corner of Indiana). Vincennes is today the oldest city in Indiana. The trading post was one of a series of forts and posts built to restrict the British from encroaching on French territory. In 1724, Pierre Dugue, Sieur de Boisbriand, commander of Fort Chartres, and Jean-Baptiste Le Moyne de Bienville, governor of Louisiana, agreed that another post was needed near the Wabash.

François Marie Bissot, Sieur de Vincennes, was detached from service in Canada and charged with establishing the new fort. He selected a site located on the Wabash and 150 miles upriver from the junction of the Wabash River and the Ohio River. The fort was completed in 1732 and named Poste des Pianguichats, after a branch of the Miami tribe. In 1736, Vincennes and several others were captured and burned at the stake when the Chickasaws defeated the French and their native allies. The post was then renamed in honor of Vincennes.

When the French and Indian War (1754–1763) ended, the Treaty of Paris (1763) required France to cede to Britain its claims to Canada and all territory east of the Mississippi River, except New Orleans. The fort and settlement at Vincennes remained under martial law until September 1764. The British finally assumed command in 1766 and renamed the post Fort Sackville. During the American Revolutionary War, in 1777, after a period of neglect, the fort was garrisoned and rebuilt by the British. Lieutenant Colonel George Rogers Clark led a daring winter raid against Vincennes, forcing its surrender on February 25, 1778.

Virginia

The first permanent English settlement in the Western Hemisphere, Virginia occupied a prominent place in colonial America. Virginians developed an agrarian, plantation-based economic system rooted in tobacco cultivation. An insatiable demand for land, quickly depleted by tobacco, fueled the colony's rapid westward expansion. Initially dependent on indentured laborers, planters eventually turned to African slaves to work their holdings. Politically, a tradition of self-government, shaped by the colonial planter elite, spread across the colony. Adapted to a largely rural setting, English social and political customs anchored the experiment. Vir-

ginia became the most prosperous colony in colonial English North America during the 17th century.

English explorers, fishermen, and traders probed North America from 1500 onward. England nevertheless lagged behind its European competitors in the colonization of the New World. Several English courtiers, notably Sir Walter Raleigh, sponsored settlements in North America. Those efforts failed, although none so mysteriously as Raleigh's "lost colony" of Roanoke in a region he named Virginia. Then, after the Anglo-Spanish War of 1585–1604, a group of prominent public figures formed a joint stock company to renew the drive for colonization. In 1606, the London Company dispatched three ships and 140 colonists to the Chesapeake Bay. After surveying the region, the 100 men who survived the voyage decided to plant a settlement on the northern bank of the James River in April 1607.

The colonists at Jamestown confronted staggering problems. The marshy peninsula, though easily defended, bred devastating diseases. The gentlemen adventurers, moreover, arrived ill equipped for life in the wilderness. Under company orders to find commodities (particularly gold) for export, the colonists did not capitalize on the region's natural abundance. Malnutrition, mate-

Map of Virginia, as described by John Smith in 1606. Smith was one of the founders of the Jamestown colony and helped ensure its survival. The map depicts Native American leader Powhatan, Chesapeake Bay, and the Potomac River. (Library of Congress)

rial deprivation, internal discord, and tense relations with local natives of the Powhatan Confederacy threatened the colony; an appalling mortality rate quickly thinned the ranks. In 1608, Captain John Smith took command of the settlement and improved conditions through the application of military order, assigning each man an essential task and denying provisions to men who refused to work. The colony's future nonetheless remained in doubt.

Meanwhile, in London, colonial planners reorganized the London Company, streamlined its administrative hierarchy, and raised money for a massive reinforcement of Jamestown. In 1609, it dispatched 500 colonists, including some women and children, to Virginia. Yet foul weather and sheer misfortune delayed the convoy. The 400 settlers that finally landed at Jamestown quickly overwhelmed available supplies. Only 60 Virginians survived the winter of 1609–1610, a miserable period known as the "Starving Time."

When Sir Thomas Gates arrived in May 1610, he discovered the colonists preparing to quit Virginia. Gates; Sir Thomas West, Lord

De La Warr; and Sir Thomas Dale reversed the situation through reinforcements, resupply, and sound leadership. The settlement survived, but to the chagrin of English investors it remained without a viable economic base.

English settler John Rolfe came forward with an unlikely solution to Virginia's economic problem: tobacco. He planted indigenous tobacco on his Virginia farm in 1612 but soon discarded the leaf as too coarse for European consumers. Rolfe then imported some Spanish seed from the West Indies and, having learned proper curing methods from the natives, in 1614 he sent the first shipment of Virginia tobacco to England. Two years later, Virginians exported 20,000 pounds of tobacco. The trade grew exponentially in the decades that followed; exports topped 50 million pounds in 1760.

Tobacco provided for the rapid economic expansion of colonial Virginia, and the rise of the colony's planter elite. It nonetheless brought certain structural problems. Virginians became dependent on foreign credit, and sometimes-unstable overseas markets.

Population Growth in the British Colonie
--

Year	Population (including slaves)	
1630	4,600	
1650	50,400	
1670	111,900	
1690	210,400	
1710	331,700	
1730	629,400	
1750	1,170,800	
1770	2,148,100	

Indeed, by 1776 Virginians owed two million pounds sterling to English creditors. Too frequently, overeager growers flooded the European market, deflating tobacco prices. In about 1700, a tobacco warehousing network, inspection system, and economic concentration strengthened the colonial economy. Still, Virginians were incapable of shedding their dependence on the lucrative weed.

Ecologically, tobacco cultivation exhausted the colony's soil. It also triggered erosion and encouraged deforestation. Colonists dealt with these problems by pushing west into new lands. From 1625 to 1700, Virginians spread across the coastal Tidewater region and into the Piedmont. Then, in 1716, Lt. Gov. Alexander Spotswood led an expedition over the Blue Ridge Mountains, opening the Shenandoah Valley, an area soon populated by Scots-Irish and German migrants from Pennsylvania.

As the colony grew, Virginians displaced (rather than incorporated) Native Americans; disease and conflict led to the rapid depopulation of indigenous communities. Even so, frontier insecurity became a near constant feature of life in colonial Virginia. Even before the development of tobacco agriculture, conflict with the natives overland and trade had resulted in the First Anglo-Powhatan War (1610-1614). The spread of tobacco plantations afterward encroached on native lands and helped provoke a massive Powhatan assault in May 1622 that killed some 350 colonists. The resulting Second Anglo-Powhatan War (1622–1632) ended in the natives' defeat, as did the final native effort to preserve their lands, the Third Anglo-Powhatan War (1644-1646). The colonists' victory in the conflict removed the last native threat to Virginia's westward expansion. The Second Anglo-Powhatan War had also brought down the London Company, clearing the way for the Crown to convert Virginia into a royal holding.

In the 1670s, colonial native policy, social tension, and political controversies sparked an internal uprising known as Bacon's Rebellion. In 1675, against the governor's orders, Nathaniel Bacon raised a private army to attack natives along the frontier. Political and military maneuvering ensued. When Gov. William Berkeley declared Bacon a rebel, Bacon marched on Jamestown, his militia torched it, and the governor fled. The insurrection collapsed when Bacon died suddenly of natural causes. His actions nevertheless showed how native relations, elite rivalries, and class conflict might threaten the prevailing political and social order.

Bacon's Rebellion aside, Virginians constructed relatively stable governing institutions. With little interference from London, they adopted a variant of the British political system. The chief executive, or governor, represented the London Company and, later, the Crown. Appointed by officials in England, some governors, such as Berkeley, significantly influenced colonial life. Many others presided over colonial affairs from England, delegating routine matters to subordinates in Virginia.

The provincial council, composed of English gentlemen and native Virginians (all appointed by English authorities), served as special advisers to the governor. Under the leadership of John Blair, the council dominated colonial politics between 1680 and 1720. Among its many accomplishments, the council chartered the College of William and Mary (1693) and built a new colonial capital city at Williamsburg in 1699.

Unlike governors and councilors, local representatives to the general assembly, known as the House of Burgesses, derived their authority through popular election. Sanctioned by the London Company, the assembly, the first legislative body in the Americas, first convened in 1619. For several decades, with one exception (1655), all freemen could vote in assembly elections; balloting statutes limited participation to property holders during the 1670s. Designed only to handle standard local business, the House of Burgesses instead evolved into a strong colonial parliament, tackling a host of complex legislative issues, including the creation of the colony's labor code.

In 1619, the assembly organized a program of indentured servitude, the basis of the labor market through the mid-1600s. Servants, generally young English men, agreed to work for a landholder for a set period of time in return for passage to America. A "headright system" allowed a planter to acquire additional land for each family member or servant he brought to the colony. But landholders often found indentured servants difficult to control, as demonstrated during Bacon's Rebellion. When improved economic opportunities in Britain drained the pool of prospective servants, Virginians turned to chattel slavery.

Dutch traders brought the first Africans to the colony in 1619. The number of bondsmen in Virginia, however, remained low through the 1660s, and many Africans were considered indentured servants but served longer terms than white servants. After the assembly legalized slavery in 1661, the number of African slaves gradually increased, reaching 10,000 by 1700. In 1770, roughly 187,000 slaves, or 42 percent of the colony's total population of 447,000, worked in Virginia. Over time, the assembly adopted measures to prevent slave revolts, passed runaway slave laws, and wrote codes defining the legal status of blacks.

As the practice of slavery spread, troubling moral, social, and racial questions moved legislators to limit slave imports through taxes. The Crown forbade those measures, deemed threatening to the Virginia labor market, economy, and royal revenues. Overall, the experience of individual slaves depended on local conditions and was sometimes brutal, sometimes benevolent. Throughout,

slaves combined African traditions with New World customs to shape, when possible, the circumstances of their own existence, increasingly concentrated on large plantations.

By 1700 the plantation network was dominating colonial life: even small farmers relied on the great planters for essential goods and services. Clinging to the region's river network, Virginians shunned town-centered settlements. Estates plugged into the larger trans Atlantic commercial network at riverside landings.

In this mostly rural environment, certain public institutions developed slowly. Whereas the New England township system provided for public education, wealthy Virginians relied on tutors, and the elite often sent their children overseas to study. The homes of major planters served as courtrooms, banks, and political parlors. Printing presses and published materials were scarce, although some elite planters acquired impressive personal libraries.

The Church of England, sanctioned by the colonial government, failed to attract and retain a sufficient number of clergy. Anglican officials were prominent in some areas, but the colony (without major population centers) had few large congregations, leaving space for other denominations and sects.

From 1607 to 1660, royal authorities showed little interest in Virginia's religious or secular development. New imperial regulations during the 1660s and 1670s, partly a response to Bacon's Rebellion, gave way again to a long period of salutary neglect.

Until the 1750s, Virginia had little direct involvement in the colonial wars between England and France. However, the decision of Virginia land speculators and the provisional government to control territory claimed by the French in the Ohio River Valley provided the catalyst for the French and Indian War (1754–1763). After the French drove British traders from the region and refused Virginia governor Robert Dinwiddie's demand that they withdraw, in 1754 Dinwiddie sent Lieutenant Colonel George Washington and some Virginia militiamen to oust the French from the contested region. Although the French forced Washington to surrender on July 3, the confrontation led the British government to send troops to assert its claims in the Ohio Valley. Virginians participated in many of the subsequent campaigns, and the colony's frontiers suffered from frequent raids by French-allied natives.

The French and Indian War brought Britain into closer contact with the colony and spawned mutual distrust. After the war, the Crown, burdened with heavy debt, worked to bring its American colonies under closer supervision and imposed new taxation, with lasting consequences.

Virginians such as Patrick Henry, Thomas Jefferson, Richard Henry Lee, and George Washington opposed British encroachment on perceived colonial rights. They railed against the Stamp Act (1765), Townshend duties (1767), and Coercive Acts (1774), measures particularly distasteful during a time of economic recession in Virginia. The Virginia General Assembly dispatched representatives to the First Continental Congress in 1774, where Virginians occupied key leadership positions. In December 1775, the Virginia Militia defeated British forces at Great Bridge near Norfolk. British

military units did not return to Virginia again until just before the climactic 1781 showdown at Yorktown.

Virginia-Indian Treaty Event Date: October 5, 1646

Treaty between Virginia and the remnants of the Powhatan Confederacy that concluded the Third Anglo-Powhatan War (1644–1646). Faced with the rapid expansion of the colony of Virginia, Powhatan leader Opechancanough launched a full-scale attack on the settlers in March 1644 in a desperate bid to preserve native sovereignty. Despite initial successes that claimed the lives of as many as 500 Virginians, the colonists quickly regrouped and counterattacked, devastating Powhatan towns and crops. Opechancanough was taken prisoner and ultimately murdered by one of his guards in the late summer of 1646.

After Opechancanough's death, his successor, Necotowance, began peace negotiations with Gov. William Berkeley. The war had reduced the once-extensive Powhatan lands to a small core of communities. In a treaty signed on October 5, 1646, Necotowance agreed that the Powhatans would be confined to small territories (in effect, the first native reservations in America) north of the York River. He further conceded that the natives' remaining land was held by them as if granted by the English Crown. Future Powhatan leaders would be confirmed by the Virginia government, to which the Powhatans acknowledged their dependency and pledged loyalty. Other provisions of the treaty required the natives to return runaway servants to Virginia officials and pay an annual tribute of 20 beaver skins to the colonial government.

In return for these concessions, Virginia authorities promised the Powhatans legal and military protections and strict policing of the new Anglo-native boundaries. Native messengers wishing to enter colonial territory were required to wear special striped shirts for identification. Unauthorized contact between settlers and natives was punishable by the death penalty for all offenders, with an exception made for young native servants. To prevent traders from cheating the natives, an issue Virginia officials believed had helped provoke the war, trade was restricted to designated frontier forts. Over time, however, the impracticality of these draconian measures became clear and penalties were reduced. Eventually, the colonial government relaxed its control over trade and ignored settlers' encroachment on native lands. After 1649, Virginia ended its policy of dealing with the Powhatan Confederacy and began renegotiating treaties with the separate constituent tribes. Virginia's native policy continued to undergo piecemeal alteration until it was recodified by the Virginia-Indian Treaty of 1677.

Virginia-Indian Treaty

Event Date: May 29, 1677 and April-June 1680

Following Bacon's Rebellion in 1676–1677, representatives of King Charles II negotiated the Virginia-Indian Treaty of 1677/1680, also known as the Treaty of Middle Plantation, with several Virginia native tribes to rectify the wrongs done to the natives during that conflict. Bacon's Rebellion began with skirmishes between a few natives and colonists on the frontier of English settlement, but quickly evolved into an attack on innocent Indians who had no part in the original dispute. Following the conflict, commissioners sent by the Crown to investigate the rebellion exonerated the native tribes who had been unfairly attacked and made the Virginia-Indian Treaty of 1677/1680 to strengthen the tribes' rights as loyal subjects of the king.

A first version of the treaty was signed on May 29, 1677, at Middle Plantation (rechristened Williamsburg in 1699) by Queen Cockacoeske of the Pamunkeys and her son, a Nansemond chief. As word spread of the treaty's fairness, representatives of several other tribes, including the Meherrins, the Monacans, the Saponis, the Pattanouchus, and the Portabaccos, signed the agreement between April and June 1680.

This liberal treaty granted tributary natives the same civil rights enjoyed by the English. For example, individual natives could settle disputes in county courts, where they would be treated as any subject of the Crown would be. The treaty also established protections for natives employed by English colonists, so that they would not become de facto slaves.

Additionally, the treaty sought to resolve problems surrounding land use; tribes would have perpetual ownership of land in a three-mile radius from their towns for foraging and hunting. Tributary natives could also hunt on unfenced English lands and forage almost anywhere for things not valued by the colonists, such as the edible tuckahoe found in the marshes.

In return, the tribes that signed the treaty accepted their status as subjects of the king and agreed to pay an annual tribute to the Virginia governor. They also had the responsibility to report the presence of foreign natives and take up arms against them alongside the English, when necessary.
